## 2 Special usage rights

Irrevocable permission to use, sell, or manufacture from the information contained in this document or any subsequent modification or revision thereof, and the right to reproduce or publish this document or any subsequent modification or revision thereof, in whole or in part, free of charge, is hereby given to the following:

1 National Associations who are members of ASD and all their member companies.

2 Members of Aerospace Industries Association of America.

3 Members of International Coordinating Council of Aerospace Industries Associations (ICCAIA) not included in Categories 1 thru 2 inclusive.

4 Airlines and Armed Forces that are customers of Companies included in Categories 1 thru 3 inclusive.

5 Ministries of Defence of the member countries of ASD.

6 The Department of Defense of the USA.

## 3 Agreement for use of the specification S1000D™ suite of information

### 3.1 Definitions

**S1000D™ suite of information** means, but is not limited to:

- the technical publications specification S1000D
- examples (eg XML instances, PDF files, style sheets), XML schemas
- any other software or information under the heading "**S1000D™ suite of information**", on the pages titled "S1000D On-line" and "Download" on the website www.s1000d.org.

**Copyright Holders** means AeroSpace and Defence Industries Association of Europe (ASD) and Ministries of Defence of the member countries of ASD.

## 3.2 Notice to user

By using all or any portion of **S1000D™ suite of information** you accept the terms and conditions of this User Agreement.

This User Agreement is enforceable against you and any legal entity that has obtained **S1000D™ suite of information** or any portion thereof and on whose behalf it is used.

## 3.3 License to use

As long as you comply with the terms of this User Agreement, the Copyright Holders grant to you a non-exclusive license to use **S1000D™ suite of information.**

## 3.4 Intellectual property rights

**S1000D™ suite of information** is the intellectual property of and is owned by the Copyright Holders, AIA and ATA. Except as expressly stated herein, this User Agreement does not grant you any intellectual property right in the **S1000D™ suite of information** and all rights not expressly granted are reserved by the Copyright Holders AIA and ATA.

## 3.5 No modifications

You shall not modify, adapt or translate, in whole or in part, **S1000D™ suite of information**. You may however add business rules.

## 3.6 No warranty

**S1000D™ suite of information** is being delivered to you "as is". The Copyright Holders do not warrant the performance or result you may obtain by using **S1000D™ suite of information**. The Copyright Holders make no warranties, representations or indemnities, express or implied, whether by statute, common law, custom, usage or otherwise as to any matter including without limitation merchantability, integration, satisfactory quality, fitness for any particular purpose, or non-infringement of third parties rights.

## 3.7 Limitation of liability

In no event will the Copyright Holders be liable to you for any damages, claims or costs whatsoever or any consequential, indirect or incidental damages, or any lost profits or lost savings or for any claim by a third party, even if the Copyright Holders have been advised of the possibility of such damages, claims, costs, lost profits or lost savings.

## 3.8 Indemnity

You agree to defend, indemnify, and hold harmless the Copyright Holders and its parents and affiliates and all of their employees, agents, directors, officers, proprietors, partners, representatives, shareholders, servants, attorneys, predecessors, successors, assigns, and those who have worked on the preparation, publication or distribution of the **S1000D™ suite of information** from and against any and all claims, proceedings, damages, injuries, liabilities, losses, costs, and expenses (including reasonable attorneys' fees and litigation expenses), relating to or arising from your use of **S1000D™ suite of information** or any breach by you of this User Agreement.

## 3.9 Governing law

This User Agreement will be governed by and construed in accordance with the laws of the Kingdom of Sweden.

Any dispute, controversy or claim arising out of or in connection with this User Agreement, or the breach, termination or invalidity thereof shall be finally settled by arbitration in accordance with the Rules of the Arbitration Institute of the Stockholm Chamber of Commerce. The arbitral

tribunal shall be composed of a sole arbitrator. The place of arbitration shall be Stockholm. The language to be used in the arbitral proceedings shall be English.

If the dispute, inclusive of any counterclaims, claims for set-off and interest should comprise of an amount less than SEK 500000, exclusive of VAT, the Rules for Expedited Arbitrations of the Arbitration Institute of the Stockholm Chamber of Commerce shall be applied.

# Highlights

## *Issue 4.0*

The listed changes are introduced in Issue 4.0, dated 2008-08-01, of the publication.

Issue 4.0 is a complete revision of the specification, so no change marks appear.

Table 1 summarizes the changes that have been made from Issue 3.0. These changes have been grouped under 18 topics to make it easier to find them. The topics are:

1 identification and status section

2 steps and paragraphs

3 warnings, cautions, and notes

4 hotspots

5 process data module

6 publication module

7 references

8 information codes

9 IPD data module

10 preliminary requirements

11 BREX data module

12 schema cleanup

13 technical information repository data module

14 schedule data module

15 checklist data module

16 training

17 comment schema

18 miscellaneous.

**Note**

Some CPFs affect multiple topics. They have been listed only under their principal topic, however.

*Table 1 Summary of changes*

| Change(s) to | CPF(s) | Chapter(s) affected |
|---|---|---|
| **Identification and status section** | | **Chaps 3, 4, 5, 6, 7** |
| 1. Changed the order of children in element <dmAddress> | 2004-051DE | 3.5, 3.6, 3.7, 3.9.3, 3.9.5.1, 3.9.5.2.1, 3.9.5.2.1.1, 3.9.5.2.1.10, 3.9.5.2.1.2, 3.9.5.2.1.3, 3.9.5.2.1.4, 3.9.5.2.1.5, 3.9.5.2.1.6, |
| 2. Removed element <age> and element <avee> | 2004-051DE | |

| Change(s) to | CPF(s) | Chapter(s) affected |
|---|---|---|
| 3. Changed attribute `inWork` from optional to required | 2006-044US) | 3.9.5.2.1.7, 3.9.5.2.1.8, 3.9.5.2.1.9, 3.9.5.2.2, 3.9.5.2.3, 3.9.5.2.4, 3.9.5.2.5, 3.9.5.2.6, 3.9.5.2.7, 3.9.5.2.9.2, 3.9.5.2.9.3, 3.9.5.2.9.4, 3.9.5.2.9.5, 3.9.5.2.9.6, 3.9.5.2.9.7, 3.9.5.2.9.8, 3.9.5.2.9.9, 3.9.5.2.9.10, 3.9.5.2.9.11, 3.9.5.2.9.12, 3.9.5.2.9.13, 3.9.5.2.10, 3.9.5.2.11.1, 3.9.5.2.11.2, 3.9.5.2.11.3, 3.9.5.2.11.4, 3.9.5.2.11.5, 3.9.5.2.11.8, 3.9.5.2.11.9, 3.9.5.2.12, 3.9.5.3, 3.9.5.3.1, 3.9.5.3.2, 4.2, 4.5.1, 4.6, 4.7, 4.8, 4.9.1, 4.9.3, 4.9.4, 4.12, 5.2.1.4, 5.2.1.16, 5.3.1.1, 6.2.1, 6.2.2, 7.3.1.1, 7.3.1.4, 7.3.3, 7.4.1.1, 7.4.1.2, 7.4.2.1, 7.5.1, 7.5.2.1, 7.5.3, 7.6.1, 7.7.1, 7.7.2, 7.7.3 |
| 4. Restricted the definition of <`applic`> in this section to allow only inline referencing using the attribute `applicRefId` | 2006-056SE | |
| 5. Added element <`supersedure`> | 2006-069US | |
| 6. Changed use of element <`copyright`> to optional | 2007-009SE | |
| 7. Added element <`productSafety`> and attribute `safetyLabel` | 2007-045AA | |
| 8. Added the optional element <`logo`> | 2007-091SE | |
| 9. Deleted the element <`dmSize`> | 2008-001FR | |
| **Steps and paragraphs** | | **Chaps 3, 6, 7** |
| 1. Introduced recursive elements (<`proceduralStep`> and <`levelledPara`>) | 2004-060US | 3.9.3, 3.9.5.2.1, 3.9.5.2.1.1, 3.9.5.2.1.3, 3.9.5.2.1.5, 3.9.5.2.1.10, 3.9.5.2.2, 3.9.5.2.3, 3.9.5.2.4, 3.9.5.2.6, 3.9.5.2.7, 3.9.5.2.10, 3.9.5.3, 3.9.6.1, 6.2.2, 6.2.3.4, 6.3.1, 7.3.1.1, 7.6.1, 7.7.1 |
| 2. Added definition list headers | 2006-099US | |
| 3. Changed narrative to be consistent with schema (titles on descriptive paragraphs and list display) | 2006-030GB | |
| 4. Included security attributes on elements which render as paragraphs | 2006-068US | |
| 5. Added new attributes `itemCharacteristic`, `crewStepCondition` and `partCharacteristic` (also affects crew data module) | 2006-101US | |
| 6. Added attribute `keepWithNext` | 2006-102US | |
| 7. Clarified paragraph content per data module type | 2007-021SE | |
| **Warning, cautions and notes** | | **Chaps 3, 6, 7** |
| 1. Added reusable warnings and cautions collection | 2004-067SE | 3.9.3, 3.9.5.2.1.1, 3.9.5.2.1.3, 3.9.5.2.1.6, 3.9.5.2.1.9, 3.9.5.2.1.10, 3.9.5.2.3, 3.9.5.2.4, 3.9.5.2.6, 6.2.2, 6.6.2, 7.3.1.1 |
| 2. Added new element <`warningAndCautionPara`> to enforce existing narrative | 2006-066US | |
| 3. Changed to display order to optional | 2006-067US | |
| 4. Changed to allow restricted lists in notes | 2007-051AA | |

| Change(s) to | CPF(s) | Chapter(s) affected |
|---|---|---|
| **Hotspots** | | **Chaps 3, 7** |
| 1. Added element <`internalRef`> to the element <`catalogSeqNumber`> in order to allow hotspot management in IPD data module | 2005-010FR | 3.9.5.2.7, 7.3.1.1 |
| **Process data module** | | **Chaps 3, 7** |
| 1. Included supporting information with dialog (on node) | 2006-005US | 3.9.5.2.1.9, 3.9.5.2.3, 3.9.5.2.10, 3.9.5.3, 6.2.3.3, 7.3.1.1, 7.6.1 |
| 2. Added <`assertion`> to note conditions in state tables | 2006-041US | |
| 3. Added unary operators | 2006-065US | |
| 4. Loosened restrictions on figure placement | 2006-090US | |
| **Publication module** | | **Chap 4** |
| 1. Changed <`pmEntryTitle`> to optional | 2006-010SE | 4.9.1 |
| 2. Added attribute `pmEntryType` with project configurable values | 2006-084US | |
| **References** | | **Chaps 3, 7** |
| 1. Removed attributes `pretext` and `posttext` | 2007-013SE | 3.9.5.2.1.1, 3.9.5.2.1.2, 3.9.5.1, 3.9.6.1, 7.3.1.1, 7.3.1.4 |
| 2. Modified structure and added support for element <`reasonForUpdate`> | 2007-062AA | |
| **Information codes** | | **Chap 8** |
| 1. Added 31 Information Codes (IC)s for US Army | 2006-088US | 8.4.1, 8.4.2 |
| 2. Defined information code 217 | 2006-105DE | |
| 3. Defined information code 227 | 2006-106DE | |
| 4. Defined information code 236 | 2006-107DE | |
| 5. Defined information code 237 | 2006-108DE | |
| 6. Defined information code 297 | 2006-109DE | |
| 7. Defined information code 28, modified information code 800 | 2007-071SE | |
| 8. Defined information code 961 | 2007-072SE | |
| 9. Amended and extended description of information code 230 | 2007-109DE | |
| **IPD data module** | | **Chaps 3, 7** |
| 1. Added element <`descrForItem`> and attribute `descrForItemCode` | 2006-077US | 3.9.5.2.7, 3.9.6.1, 7.3.1.1 |
| **Preliminary requirements** | | **Chaps 3, 6** |
| 1. Added support for required technical information, number of personnel required and environmental conditions | 2006-075US | 3.9.5.2.1.1.3, 3.9.5.2.1.1.7, 3.9.5.2.1.1.8, 3.9.5.2.1.1.9, 3.9.5.2.1.2, 3.9.5.2.1.9, 3.9.5.2.3, |

| Change(s) to | CPF(s) | Chapter(s) affected |
|---|---|---|
| 2. Restructured preliminary requirements, mainly element <productionMaintData> | 2007-019SE | 3.9.5.2.5, 3.9.6.1, 6.2.2, 6.2.3.3 |
| 3. Added optional element <shortName> under element <supportEquipDescr> | 2007-020SE | |
| 4. Added attribute unitOfMeasure to element <estimatedTime> | 2007-100DE | |
| **BREX data module** | | **Chaps 4, 7** |
| 1. Added layered BREX, pattern value support, etc. | 2006-045SE<br>2007-101SE | 4.10, 4.10.2, 4.10.3, 7.3.1.1 |
| **Schema cleanup** | | **Chaps 3, 4, 5, 6, 7** |
| Rules were established for maintaining the schemas in the areas of:<br>– naming XML objects<br>– when to use an element versus an attribute<br>– grouping objects into (reusable) groups<br>– when redefinitions are allowed<br>– element content models<br>– use of typing and patterns<br>– reference/link structures<br>– data dictionary<br>The schemas were modified to ensure conformance with the defined rules. The specific changes were fully documented in CPFs and are detailed below. | | 3.3, 3.5, 3.7, 3.9.3, 3.9.5, 3.9.5.1, 3.9.5.2.1.1, 3.9.5.2.1.2, 3.9.5.2.1.3, 3.9.5.2.1.4, 3.9.5.2.1.5, 3.9.5.2.1.7, 3.9.5.2.1.8, 3.9.5.2.1.9, 3.9.5.2.1.10, 3.9.5.2.2, 3.9.5.2.3, 3.9.5.2.4, 3.9.5.2.5, 3.9.5.2.6, 3.9.5.2.9.2, 3.9.5.2.9.3, 3.9.5.2.9.4, 3.9.5.2.9.5, 3.9.5.2.9.6, 3.9.5.2.9.7, 3.9.5.2.9.8, 3.9.5.2.9.9, 3.9.5.2.9.10, 3.9.5.2.9.11, 3.9.5.2.9.12, 3.9.5.2.9.13, 3.9.5.2.10, 3.9.5.2.11.1, 3.9.5.2.11.2, 3.9.5.2.11.3, 3.9.5.2.11.4, 3.9.5.2.11.5, 3.9.5.2.11.6, 3.9.5.2.11.7, 3.9.5.2.11.8, 3.9.5.2.11.9, 3.9.5.2.12, 3.9.5.3, 3.9.5.3.1, 3.9.5.3.2, 3.9.5.3.3, 3.9.6.1, 4.3, 4.3.9, 4.5.1, 4.6, 4.7, 4.9.2, 4.9.3, 4.9.4, 4.10.2, 4.12, 5.2.1.4, 5.2.1.20, 5.3.1.1, 5.3.1.3, 6.2.2, 6.2.3.3, 6.2.3.4, 7.3.1.1, 7.3.1.4, 7.3.2, 7.3.3, 7.4.1.1, 7.4.3, 7.5.2.1, 7.5.3, 7.6.1, 7.7.1, 7.7.4, 7.8<br>**Note**<br>CPF 2006-046SE affected the majority of the specification |
| 1. Harmonized elements between data modules, added element wrappers for easier presentation, renamed elements and attributes and restructured many elements | 2006-046SE | |
| 2. Added wrapper for legend items | 2006-078US | |
| 3. Renamed element <closetxt> to <closeRqmts> | 2007-014SE | |
| 4. Restored List of Applicable Publications (LOAP) | 2007-016SE | |
| 5. Removed element <entfield> | 2007-024SE | |
| 6. Updated text in example elements <indexValue> and <indexLength> | 2007-042US | |
| 7. Deleted the <remove> element from the unary operations table | 2007-043US | |
| 8. Harmonized change markup | 2007-077S1 | |
| 9. Converted expression operators into attribute types | 2007-094S1 | |
| 10. Renamed attributes to be context-specific | 2007-096SE | |
| 11. Harmonized reference structures | 2007-097SE | |
| 12. Harmonized the identification of objects | 2007-098SE | |

| Change(s) to | CPF(s) | Chapter(s) affected |
|---|---|---|
| 13. Harmonized required item consistency in preliminary requirements | 2007-099SE | |
| 14. Added values to attribute `thresholdUnitOfMeasure` | 2007-107AA | |
| 15. Restructured <`responsiblePartnerCompany`> and <`originator`> | 2007-108S1 | |
| 16. Redefined <`proceduralStep`> to require a title or paragraph structure so as to eliminate the possibility of creating an empty step | 2007-111S1 | |
| 17. Harmonized the use of ranges in element <`objectValue`> (BREX data module) | 2007-112S1 | |
| 18. Harmonized the use of Booleans and flags | 2007-113S1 | |
| **Technical information repository data module** | | **Chaps 3, 4, 7, 8** |
| 1. Added support for physical/functional breakdowns | 2006-053AA | 3.9.5.2.1.7, 3.9.5.2.1.10, 3.9.5.2.11, 3.9.5.2.11.1, 3.9.5.2.11.2, 3.9.5.2.11.6, 3.9.5.2.11.7, 3.9.5.2.11.9, 3.9.5.2.11.10, 3.9.5.2.11.12, 3.9.5.3, 3.9.6.1, 4.3.2, 4.13.1, 4.13.2, 7.3.1.1, 7.3.1.4, 8.4.1, 8.4.2 |
| 2. Added extra support for organization information | 2006-055AA | |
| 3. Added support for reuse of controls and indicators | 2006-060US | |
| 4. Added support for maintenance level | 2006-079US | |
| **Schedule data module** | | **Chaps 3, 5, 6, 7** |
| 1. Added element <`maintAllocation`> | 2006-095US | 3.9.5.2.1.9, 3.9.5.2.1.12, 3.9.5.2.3, 3.9.5.2.4, 3.9.5.2.5, 3.9.6.1, 5.2.1.6, 6.2.3.3, 7.3.1.1, 7.3.1.4 |
| 2. Added element <`commonInfo`> (also added to procedural data module and fault data module) | 2006-100US | |
| 3. Changed element <`fec`> to <`sourceType`>. Added project configurable tables for source criticality and source type code attributes | 2007-047AA | |
| 4. Modified <`task`> element to include <`taskTitle`>, <`taskDescr`> and <`taskMarker`> | 2007-068AA | |
| 5. Added support for airplane tasks | 2007-069AA | |
| 6. Harmonized the values for attribute `limitTypeValue` in schema and narrative | 2007-095SE | |
| 7. Defined relationship between maintenance requirements | 2007-106AA | |
| **Checklist data module** | | **Chaps 1, 3, 5, 7, 9** |
| 1. Added new data module to support checklists | 2007-078US | 1.2, 3.3, 3.9.5.2, 3.9.5.2.1, 3.9.5.2.14, 3.9.6.1, 5.2.1.21, 7.3.1.1, 9.2 |

| Change(s) to | CPF(s) | Chapter(s) affected |
|---|---|---|
| **Training** | | **Chaps 1, 3, 4, 5, 7, 8, 9** |
| 1. Added new data modules to support training content<br>2. Added optional learn code attributes to element <dmCode> | 2007-037US<br>2007-038US<br>2007-040US<br>2007-041US | 1.2, 3.9, 3.9.5.1, 3.9.5.2.13, 3.9.5.2.13.1, 3.9.5.2.13.2, 3.9.5.2.13.3, 3.9.5.2.13.4, 3.9.5.2.13.5, 3.9.7, 4.1, 4.3, 4.3.8, 4.3.9, 4.3.10, 4.3.11, 4.9, 4.9.1, 4.9.2, 4.9.3, 4.9.4, 4.9.5, 4.14, 5.2.1.19, 5.3.1.1, 7.3.1.1, 7.3.1.3, 7.5.1, 7.5.2.1, 7.5.4, 7.7.4, 8, 8.1, 8.2, 8.3, 8.4, 8.5, 8.5.1, 8.5.2, 9.2 |
| **Comment schema** | | **Chap 4** |
| 1. Loosened restrictions on module use | 2007-046AA | 4.6 |
| **Miscellaneous** | | **Chaps 1, 3, 4, 5, 6, 7, 8, 9** |
| 1. Clarified the use of "Not given" vs. "NOT GIVEN"<br>2. Repeated information regarding extended or qualified information name<br>3. Changed CSN presentation<br>4. Changed conflicting names so that schemas and specification coincide<br>5. Loosened drawing reference requirements, language consistency, and consistency for specific information code use in paragraphs | 2006-011GB<br>2006-23GB<br>2006-32SE<br>2006-036US<br>2006-051AA | 1.3, 1.5, 3.4, 3.9.1, 3.9.2.1, 3.9.2.2, 3.9.2.3, 3.9.5, 3.9.5.1, 3.9.5.2.1.2, 3.9.5.2.1.6, 3.9.5.2.1.9, 3.9.5.2.5, 3.9.5.2.7, 3.9.6.1, 4.3.3, 4.3.9, 4.3.11, 4.4, 4.5.1, 4.6, 4.9.1, 5.2.1.6, 5.2.2.2, 5.2.2.3, 5.3.1.1, 6.1, 6.2, 6.2.1, 6.2.2, 6.2.3.3, 6.3, 6.3.1, 6.4, 7.3.3, 7.5.1, 8.1, 8.2.1, 8.2.2, 8.2.3, 8.2.4, 8.2.5, 8.2.6, 8.2.7, 8.2.8, 8.3, 8.3.1.18, 8.4, 8.4.1, 8.4.2, 9.2 |
| 6. Changed foldout restrictions for paper | 2006-058US | **Note**<br>Both CPF 2007-048DE and CPF 2007-070US affected the majority of the specification |
| 7. Loosened restriction on the use of "End of data module" | 2006-061US | |
| 8. Increased flexibility for standard of measurement | 2006-073US | |
| 9. Added support for double-column presentation | 2006-074US | |
| 10. Loosened restrictions on minimum font size | 2006-080US | |
| 11. Loosened restrictions on page number presentation | 2006-082US | |
| 12. Modified ICN for human readability | 2007-017SE | |
| 13. Loosened restrictions on illustration heights | 2007-018SE | |
| 14. Changed wording from "self-standing" to "self-contained" | 2007-022SE | |
| 15. Included support for submarine zoning | 2007-031US | |
| 16. Loosened restrictions on LOAP | 2007-034DE | |
| 17. Inserted missing range narrative for attribute `installationLocationType` | 2007-035DE | |
| 18. Amended Yes/No dialog options | 2007-044US | |
| 19. Added support for business rule categories and layers | 2007-048DE | |

| Change(s) to | CPF(s) | Chapter(s) affected |
|---|---|---|
| 20. Defined paper sizes more accurately | 2007-049US | |
| 21. Corrected data module code example | 2007-052S1 | |
| 22. Corrected table explanation | 2007-053S1 | |
| 23. Included technical information repository data module in <dmRef> usage exceptions | 2007-063AA | |
| 24. Deleted maintenance plan definitions to loosen restrictions | 2007-064AA | |
| 25. Harmonized the use of "must" | 2007-070US | |
| 26. Modified CPF process | 2007-080S1 | |
| 27. Harmonized the term "multimedia" to permit generic use | 2007-081S1 | |
| 28. Corrected narrative references to multimedia | 2007-082S1 | |
| 29. Corrected several typographical errors | 2007-086US | |
| 30. Modified content to be more human-readable | 2007-087US | |
| 31. Harmonized the use of various terms | 2007-089US | |
| 32. Harmonized the use of the attribute issueType with the narrative | 2007-090S1 | |
| 33. Included a 37-character data module code example | 2007-103SE | |
| 34. Corrected referenced International Electrotechnical Commission (IEC) Publication | 2008-002AA | |

# Table of contents

The listed documents are included in Issue 4.0, dated 2008-08-01, of this publication.

| Document title | Chapter | Applicable to |
|---|---|---|
| Introduction to the specification | Chap 1 | All |
| Purpose | Chap 1.1 | All |
| Scope | Chap 1.2 | All |
| How to use the specification | Chap 1.3 | All |
| How to tailor for a specific project | Chap 1.4 | All |
| Request for change | Chap 1.5 | All |
| Documentation process | Chap 2 | All |
| Documentation process - Overview | Chap 2.1 | All |
| Documentation process - Use of standards | Chap 2.2 | All |
| Documentation process - Relations to other processes and standards | Chap 2.3 | All |
| Documentation process - Implementation guide | Chap 2.4 | All |
| Documentation process - Business rules | Chap 2.5 | All |
| Business rules - Categories and layers | Chap 2.5.1 | All |
| Business rules - Generation and use | Chap 2.5.2 | All |
| Information generation | Chap 3 | All |
| Information generation - Introduction | Chap 3.1 | All |
| Information generation - Data modules | Chap 3.2 | All |
| Information generation - Information sets | Chap 3.3 | All |
| Information generation - Zoning and access | Chap 3.4 | All |
| Information generation - Updating data modules | Chap 3.5 | All |
| Information generation - Security and data restrictions | Chap 3.6 | All |
| Information generation - Quality assurance | Chap 3.7 | All |
| Information generation - Disassembly principles | Chap 3.8 | All |
| Information generation - Authoring | Chap 3.9 | All |
| Authoring - General writing rules | Chap 3.9.1 | All |
| Authoring - Illustration rules and multimedia | Chap 3.9.2 | All |
| Illustration rules and multimedia - Illustrations, General | Chap 3.9.2.1 | All |
| Illustration rules and multimedia - Navigation and configuration | Chap 3.9.2.2 | All |
| Illustration rules and multimedia - Use of color and photographs | Chap 3.9.2.3 | All |
| Illustration rules and multimedia - Multimedia, General | Chap 3.9.2.4 | All |
| Illustration rules and multimedia - Interactive 3D content | Chap 3.9.2.5 | All |
| Illustration rules and multimedia - e-learning and SCORM | Chap 3.9.2.6 | All |
| Authoring - Warnings, cautions and notes | Chap 3.9.3 | All |
| Authoring - Front matter | Chap 3.9.4 | All |
| Authoring - Data modules | Chap 3.9.5 | All |
| Data modules - Identification and status section | Chap 3.9.5.1 | All |
| Identification and status section - Export control | Chap 3.9.5.1.1 | All |
| Data modules - Content section | Chap 3.9.5.2 | All |
| Content section - Common constructs | Chap 3.9.5.2.1 | All |
| Common constructs - Change marking | Chap 3.9.5.2.1.1 | All |
| Common constructs - Referencing | Chap 3.9.5.2.1.2 | All |
| Common constructs - Lists | Chap 3.9.5.2.1.3 | All |
| Common constructs - Caption groups | Chap 3.9.5.2.1.4 | All |
| Common constructs - Titles | Chap 3.9.5.2.1.5 | All |

| Document title | Chapter | Applicable to |
|---|---|---|
| Common constructs - Tables | Chap 3.9.5.2.1.6 | All |
| Common constructs - Figures and foldouts | Chap 3.9.5.2.1.7 | All |
| Common constructs - Hotspots | Chap 3.9.5.2.1.8 | All |
| Common constructs - Preliminary requirements and requirements after job completion | Chap 3.9.5.2.1.9 | All |
| Common constructs - Text elements | Chap 3.9.5.2.1.10 | All |
| Common constructs - Controlled content | Chap 3.9.5.2.1.11 | All |
| Common constructs - Common information | Chap 3.9.5.2.1.12 | All |
| Content section - Descriptive information | Chap 3.9.5.2.2 | All |
| Content section - Procedural information | Chap 3.9.5.2.3 | All |
| Content section - Fault information | Chap 3.9.5.2.4 | All |
| Content section - Maintenance planning information | Chap 3.9.5.2.5 | All |
| Content section - Crew/Operator information | Chap 3.9.5.2.6 | All |
| Content section - Parts information | Chap 3.9.5.2.7 | All |
| Content section - Battle damage assessment and repair information | Chap 3.9.5.2.8 | All |
| Content section - Wiring data | Chap 3.9.5.2.9 | All |
| Wiring data - Wiring data Schema basic rules | Chap 3.9.5.2.9.1 | All |
| Wiring data - Wire | Chap 3.9.5.2.9.2 | All |
| Wiring data - Harness | Chap 3.9.5.2.9.3 | All |
| Wiring data - Electrical equipment | Chap 3.9.5.2.9.4 | All |
| Wiring data - Standard parts, Connector | Chap 3.9.5.2.9.5 | All |
| Wiring data - Standard parts, Distribution part | Chap 3.9.5.2.9.6 | All |
| Wiring data - Standard parts, Accessory | Chap 3.9.5.2.9.7 | All |
| Wiring data - Standard parts, Solder sleeve | Chap 3.9.5.2.9.8 | All |
| Wiring data - Standard parts, Shrink sleeve | Chap 3.9.5.2.9.9 | All |
| Wiring data - Standard parts, Identification sleeve | Chap 3.9.5.2.9.10 | All |
| Wiring data - Standard parts, Conduit | Chap 3.9.5.2.9.11 | All |
| Wiring data - Standard parts, Wire material | Chap 3.9.5.2.9.12 | All |
| Wiring data - Wiring data description Schema basic rules | Chap 3.9.5.2.9.13 | All |
| Content section - Process data module | Chap 3.9.5.2.10 | All |
| Content section - Technical information repository | Chap 3.9.5.2.11 | All |
| Technical information repository - Functional items | Chap 3.9.5.2.11.1 | All |
| Technical information repository - Circuit breakers | Chap 3.9.5.2.11.2 | All |
| Technical information repository - Parts | Chap 3.9.5.2.11.3 | All |
| Technical information repository – Zones | Chap 3.9.5.2.11.4 | All |
| Technical information repository - Access points | Chap 3.9.5.2.11.5 | All |
| Technical information repository - Enterprise information | Chap 3.9.5.2.11.6 | All |
| Technical information repository - Supplies | Chap 3.9.5.2.11.7 | All |
| Technical information repository - Supplies, requirements | Chap 3.9.5.2.11.8 | All |
| Technical information repository - Tools | Chap 3.9.5.2.11.9 | All |
| Technical information repository - Functional and/or physical areas | Chap 3.9.5.2.11.10 | All |
| Technical information repository - Controls and indicators | Chap 3.9.5.2.11.11 | All |
| Content section - Container data module | Chap 3.9.5.2.12 | All |
| Content section - Learning data module | Chap 3.9.5.2.13 | All |
| Learning data module - Learning plan information type | Chap 3.9.5.2.13.1 | All |
| Content section - Learning overview information | Chap 3.9.5.2.13.2 | All |
| Content section - Learning content information | Chap 3.9.5.2.13.3 | All |
| Content section - Learning summary information | Chap 3.9.5.2.13.4 | All |
| Content section - Learning assessment information | Chap 3.9.5.2.13.5 | All |
| Content section - Maintenance checklists and inspections | Chap 3.9.5.2.14 | All |
| Data modules - Applicability | Chap 3.9.5.3 | All |
| Applicability - Applicability cross-reference table | Chap 3.9.5.3.1 | All |

| Document title | Chapter | Applicable to |

## 1 General

This chapter gives a basic overview of the S1000D purpose including the history of the development.

## 2 Purpose

S1000D is an international specification for the procurement and production of technical publications. While the title restricts its use to technical publications, it has been found through application that the principles of the specification can be applied to non-technical publications.

This specification was initially developed by the AeroSpace and Defence Industries Association of Europe (ASD). This issue has been jointly produced by ASD, the Aerospace Industries Association of America (AIA), and the Air Transport Assosiation of America (ATA) together with their customers. These form the S1000D Council and the S1000D Steering Committee to establish standards for documentation agreed by the participating parties.

From Issue 2, the scope has been extended to include land and sea specific applications. The specification can now also be used for the support of any type of equipment including both military and civil products. All items in this specification will be referred to as "the Product".

### 2.1 Background

The concept of this specification was originated in the aerospace field within ASD in early 1980s. At that time, most civil airline projects were being documented in accordance with the ATA 100 specification. Military projects in Europe were supported by documentation produced to various national military specifications, although some attempts of rationalization had been made in certain collaborative projects. Thus, by comparison, the situation for the support of civil aircraft was the more stable and manageable. The multiplicity of existing military procedures

and the continual introduction of new procedures were producing ever greater problems and increased costs for industry and its military customers, as both became more reliant upon the use of complex computer-based systems in the field of technical publication support activities.

This situation, added to the increasing number of collaborative projects and the necessity to recognize the developments in Integrated Logistics Support (ILS) and in information technology, prompted the Customer and Product Support Committee (CPSC) of ASD to establish a Documentation Working Group (DWG). This DWG consisted of European industry representatives tasked to report on current documentation practices and to recommend a unified method of documentation for air vehicle projects.

The DWG recognized that the only internationally accepted specification in the aerospace field, although not formal recognized as an international standard, was ATA 100. It was therefore decided to attempt to harmonize civil and military documentation using ATA 100 as a source document. Many national military specifications used by the participant nations have their roots in the United States (US) Mil Specs and these were therefore to be considered. The DWG invited the nations to provide military representatives who would participate in its activities and established a subsidiary, which was designated the Augmented Documentation Working Group (ADWG).

This group realized that their attempts to harmonize specifications and to establish commonality wherever possible had the following major advantages:

- cost saving on information generation - avoidance of duplications
- more economic support planning
- cheaper deliverable publications
- uniformity of standard for participants in the project
- standard format for data exchange to exploit future developments
- enhanced inter-operability
- improved opportunity for clarity - use of ASD Simplified Technical English (ASD-STE100)
- easier and cheaper translation also possible because of ASD-STE100

The ADWG established task groups which undertook studies of specific areas to enable the development of the CSDB proposals which are contained in this specification. The final task was the incorporation of these international CSDB proposals into this publications specification which has been agreed by the participating nations.

The ADWG was later renamed Technical Publication Specification Maintenance Group (TPSMG). Their duties have now been taken over by the S1000D Council and the S1000D Steering Committee, which have the full responsibility of maintaining the specification. The S1000D Council and the S1000D Steering Committee includes members from ministries and industry.

To take care of the rapid development of information technology a group of specialists, the Electronic Publications Working Group (EPWG) support the S1000D Steering Committee.

In 2003, a Memorandum of Understanding (MOU) was signed between ASD and AIA establishing the parameters for an agreement between the two organizations harmonizing US and European guidance related to technical publications data.

In 2004, the ASD signed an MOU with ADL. The two organizations are working together to harmonize the requirements of the SCO Reference Model (SCORM).

In 2005, a MOU was signed between ASD, AIA and ATA in order to promote common, interoperable, international technical publication data in the Aerospace and Defense industries and to work in concert on the joint development and maintenance of the S1000D.

In 2007, the MOU between ASD, AIA and ATA has been renewed to enable the three organizations to jointly further develop, maintain and promote the S1000D in the international arena.

## 1 General

This chapter gives a basic overview of the S1000D scope. Refer to Fig 1.

S1000D is designed for use in civil aviation, European defense, and the United States (US) military applications (when used in conjunction with applicable business rules, as required, within the hierarchy of these organizations).

## 2 Scope

S1000D covers the planning and management, production, exchange, distribution and use of technical documentation that support the life cycle of any civil or military project. Projects include air, land and sea vehicles or equipments (hereafter known as the Product).

The specification adopts International Standards Organization (ISO), Continuous Acquisition and Life-cycle Support (CALS) and World Wide Web Consortium (W3C) standards, in which information is generated in a neutral format. This means that it can be implemented on different and often disparate systems. Neutrality, added to the concept of modularization, makes the specification applicable to the wider international community.

Information produced in accordance with S1000D is created in a modular form, called a "data module". A data module is defined as "the smallest self-contained information unit within a technical publication".

A data module contains the following information:

- An identification and status section with all management information
- A content section

The data module can support the following types of content and constructs:

- Applicability cross-reference information
- Business rules information
- Conditional cross-reference information
- Container information
- Crew/operator information
- Descriptive information
- Fault information
- IPD information
- Maintenance checklists and inspections
- Maintenance planning information
- Procedural information
- Process information
- Products cross-reference information
- Technical repository information
- Training information
- Wiring data information
- Wiring data description information

All data modules applicable to the Product are gathered and managed in a database, which is hereafter referred to as the CSDB.

A benefit of the CSDB is to enable production of platform-independent output in either page-oriented or IETP.

Data managed in S1000D is not duplicated in the CSDB. Data modules enable data to be stored once and used for multiple outputs. A single change to an individual data module can update multiple outputs and multiple deliveries.

Other benefits of using S1000D are:

- It is based on international neutral standards.
- It reduces maintenance costs for technical information.
- It transforms data into configuration items.
- It allows subsets of information to be generated to meet specific user needs.
- It facilitates the transfer of information and electronic output between disparate systems.
- Many different output forms can be generated from the same base data thus ensuring safety of data and that every user regardless of output form is getting the same message.
- The S1000D data module concept can be applied to legacy data.
- It is non-proprietary and allows neutral delivery of data and management of data.
- The specification incorporates the planning and management, production, exchange, distribution and use of data in electronic form for different types of output (from page oriented to IETP) as shown in Fig 1.

ICN-S1000D-A-010200-0-F6117-00001-A-001-01

*Fig 1 S1000D scope*

More information on S1000D and ASD publications can be found at www.s1000d.org and www.asd-europe.org, respectively.

# 1 General

This chapter gives an overview of:

- the content of the specification
- the basic production and delivery methods

and the fundamental reading rules.

# 2 Field of application

S1000D is an international specification, which is designed to cover technical publication and training activities in support of any platform, system or equipment project (air, sea, land vehicle, equipment or facilities, civil or military).

All aspects of technical publication from information generation, exchange and management within the CSDB to publication generation and the commenting process are described.

# 3 Basic definitions

| | |
|---|---|
| the Product | Any platform, system or equipment (air, sea, land vehicle, equipment or facility, civil or military) |
| project | The task to develop, maintain and dispose of the Product |

# 4 Self-contained vs repository-dependent data modules

There are two basic methods of production (authoring) and delivery (publishing) of data modules and publications:

- not using technical information repository data modules
- using technical information repository data modules, refer to Chap 4.13 and Chap 4.13.2

Not using technical information repository data modules is the "traditional way" to produce and deliver self-contained data modules.

The method of using technical information repository data modules supports optimizing and reuse of data during production. The delivery from production environment using repository data modules can be done in two ways:

- Self-contained data modules

  Data from the repository data modules are included (not linked) in the data modules to be delivered to the customer or end-user.

**Note**

Only a limited set of data from the repository data modules can be included in the data modules.

**Note**

The technical information repository data modules can still be delivered together with the self-contained data modules as the repository data modules include useful additional/detailed information which can not be accommodated in the data modules.

– Repository-dependent data modules

  Data from the repository data modules are not included in the data modules prior to delivery to the customer or end-user (or an IETP application). The customer, end-user of the IETP application, has to resolve any links before use or during use of the IETP viewer/browser.

The authoring rules differ between the two methods which are explained in the authoring chapters. Refer to Chap 3.9.5.2.1. When using technical information repository data modules certain information does not require authoring but would require referencing (linking) to the appropriate technical information repository. For example, the name of support equipment is not entered by the author, but referenced (linked) to a technical information repository data module.

# 5 Reading conventions

Throughout the S1000D specific conventions are used to aid common understanding and to minimize duplication. These conventions are:

| | |
|---|---|
| Available for projects | Information codes and attribute values that are available for projects or organizations to give their own specific definitions. |
| Not available for projects | SNS, information codes and attribute values that are not available for projects or organizations to give their own specific definitions. Projects or organizations can apply for formal definitions by the normal CPF process. |
| M | Mandatory<br>The affected markup element must be presented in the data module and the required entries in the construct must be populated. |
| O | Optional<br>The affected markup element and its associated population can be omitted if a project or organization wishes. |
| C | Conditional<br>The affected markup element is mandatory if its parent element is used. The parent element, or a parent element above that, is optional and can be omitted. |
| (D) | Default value<br>The affected markup value is the default value. |
| must | Mandatory to follow the given rules. |
| name | The name of a "thing" such as a part, a component, an assembly. Sometimes called description, nomenclature or designation. Name is used consistently throughout S1000D. |
| can, could | Options to be followed by project or organization decision |

# 6 Acronyms

Throughout the S1000D common acronyms are used to aid understanding and to minimize duplication. These acronyms are:

| | |
|---|---|
| 2D | Two Dimensional |
| 3D | Three Dimensional |
| ADL | Advanced Distributed Learning |
| ASD | European Aerospace and Defense Industries |
| ATA | Air Transport Association |
| BREX | Business Rules EXchange |
| CAGE | Commercial And Government Entity |
| CGM | Computer Graphics Metafile |
| CPF | Change Proposal Form |
| CSDB | Common Source DataBase |
| CSN | Catalog Sequence Number |
| ICN | Information control number |
| IETP | Interactive Electronic Technical Publication |
| IPD | Illustrated Parts Data |
| LMS | Learning Management System |
| LOAP | List of Applicable Publications |
| LOM | Learning Object Model |
| LSA | Logistic Support Analysis |
| PDF | Portable Document Format |
| PLCS | Product Life Cycle Support |
| QA | Quality Assurance |
| SCO | Shareable Content Object |
| SCORM | Sharable Content Object Reference Model |
| SNS | Standard Numbering System |
| XML | Extensible Markup Language |

A list of all acronyms is in Chap 9.2.

# 7 Organization of S1000D

S1000D is organized into nine chapters, which are described briefly below.

*Table 2 S1000D structure overview*

| Chapter | Title | Description |
|---|---|---|
| Chap 1 | Introduction to the specification | History and scope of the specification |
| Chap 2 | Documentation process | Overview of the documentation process and relation with other specifications |
| Chap 3 | Information generation | General rules which apply to technical publications that are produced on the basis of data modules and CSDB concepts |
| Chap 4 | Information management | Data module structure, rules for interchange and updating of data modules. Concepts for using BREX, process data modules, master - customized data modules, applicability and optimizing and reuse of information. |
| Chap 5 | Information sets and publications | Common and specific requirements for information sets and publications |
| Chap 6 | Information presentation/use | Information presentation and functionality for page oriented publications, and IETP |
| Chap 7 | Information processing | Information for the information systems specialists, including Schemas, graphic and notation specifications, resources, resolutions and interchange conventions |
| Chap 8 | SNS, information and learn codes | Description of the numbering systems and the information codes |
| Chap 9 | Terms and data dictionary | Glossary of terms and abbreviations and data dictionaries |

## 7.1 General breakdown of chapters

In general, all chapters are structured as follows:

- At the beginning of the chapter, there is a table of references that occur in the chapter.
- Para 1 gives a general introduction.
- Para 2 is the main body of the chapter. The main body can be split into several main content paragraphs.
- Para 3 gives the business rules decisions. If there are no business rules decision then the markup examples are given in Para 3.
- Para 4 gives the markup examples, if any. Short/simple examples can also be found in the main body paragraphs.

## 7.2 Chap 1 - Introduction to the specification

This chapter provides general information about the specification. The scope of the specification, how to use it, how to tailor it and the way to address change request are explained.

## 7.3 Chap 2 - Documentation process

Chapter 2 explains the generic documentation process. It provides an overview of the documentation process including the use of information technology and the relation to other

processes and specifications as for instance S2000M and PLCS. Through the process diagram, a reference to the corresponding chapters is also defined.

## 7.4 Chap 3 - Information generation

This chapter provides general rules which apply to technical publications that are produced on the basis of data modules and CSDB concepts. This chapter is primarily in support of authors and illustrators.

All data modules have a basic structure which is defined in Chap 3.2.

Information sets are used to establish the required scope of the information and data module coding strategy. The use of these information sets is fully defined in Chap 3.3.

The rules for zoning and access are given in Chap 3.4.

The issues surrounding the updating of data modules are explained in Chap 3.5.

The rules for the allocation for the protective marking of data modules that reflects their security classification, etc are detailed in Chap 3.6.

During the development and update of data modules/publications, QA procedures are required to ensure that the contents of the data modules/publications are adequate and technically accurate. Details of these procedures are given in Chap 3.7.

In order to reflect the potential breakdown of equipments, rules for disassembly are detailed in Chap 3.8.

All data modules are produced in accordance with structural rules. Authoring rules for text, illustrations and multimedia, together with front matter and warnings, cautions and notes, reinforces these structural rules which are supported by specific guidance for authoring data modules including the learning content types. These rules are given in Chap 3.9.

In all cases, the rules given in all chapters in this specification take precedence over the Schemas.

**Note**

The Schemas, in some constructs, allow more than is given in the narrative of the specification due to simplified Schema design and reduced maintenance.

## 7.5 Chap 4 - Information management

The data module code structure, rules for interchange and updating of data modules are presented. This chapter is provided in support of the project data module, illustration, publication and SCORM content package management.

Information management comprises the addressing, storage and handling of information objects such as data modules (Chap 4.2), illustrations and publications to enable the production and use of common technical documentation within a project.

This chapter contains the required information to establish an information database, called the CSDB (Chap 4.2), to interchange the data (Chap 4.8) and to handle publications and SCORM content packages derived from the CSDB (Chap 4.9).

It also gives details about the coding of data modules (Chap 4.3) and their associated illustrations and multimedia information (Chap 4.4). It describes data module lists (Chap 4.5) used for planning, management and control of CSDB content, and defines the handling of comments on data modules and publications (Chap 4.6). The means to enable version control (Chap 4.7) and interchange of data modules are also described in this chapter.

BREX (Chap 4.10) and use of the process data module is explained (Chap 4.11).

Managing multi-customer environment is described in the master-customized concept (Chap 4.12).

The chapter also includes the concept of optimizing and reuse of data (Chap 4.13). Optimizing and reuse includes handling of significant data within a data module and a mechanism to group properties related to different technical information types with the aim to reduce redundant information and to increase support consistency (the technical information repository data module concept). A production management mechanism to associate several data modules representing the same data with different product configuration (the container data module concept) is also described.

An applicability model is presented which can be used at many different levels, from simple to very complex. The model is capable of supporting from a static textual output to a dynamic output that is filtered for the actual configuration of the product instance. An overview and functional capabilities of the applicability model are explained (Chap 4.14).

## 7.6 Chap 5 - Information sets and publications

This chapter contains common and specific requirements for information sets and publications, necessary to operate and maintain the Product. This chapter is primarily provided for project publication procurement, management, authors and illustrators.

An information set is the required information needed in a defined scope and depth (author's view), in the form of data modules, managed in the CSDB.

A publication is the compilation and publishing of information for a customer (user's view). This can be an IETP, a paper publication compiled from data modules or a publication with legacy data. It can be a subset of or equal to an information set, but it can also be a superset of several information sets or parts of them.

The List of Applicable Publications (LOAP) lists the required publications for a customer project.

Requirements for information sets are given in Chap 5.2 and for publications in Chap 5.3.

## 7.7 Chap 6 - Information presentation/use

This chapter provides information presentation and use rules for page-oriented publications (Chap 6.2), and IETP (Chap 6.3). The functionality matrix for page oriented publications, both paper and screen based, together with the display of information in a non-linear fashion, are explained in Chap 6.4. This chapter is mainly provided in support of project publication procurement, management, authors, illustrators and information technology specialists.

## 7.8 Chap 7 - Information processing

This chapter describes the technical aspects of the Schemas, graphics and notations together with information interchange, resolution of resources and software requirements.

## 7.9 Chap 8 - SNS, information codes and learn codes

This chapter gives a description of a common SNS and the information codes used in the data module code.

The S1000D maintained set of SNSs is given in Chap 8.2 for air vehicles, engines and equipment, tactical missiles, support equipment general land and general sea Product.

Chap 8.3 refers to examples of SNS (eg power provision, artillery radar, software, medical and technical publication projects). These example SNS are given on the S1000D website (www.s1000d.org).

The detailed definitions of the information codes are given in Chap 8.4 and the learn codes are given in Chap 8.5.

## 7.10 Chap 9 - Terms and data dictionary

This chapter provides a glossary of terms, abbreviations and acronyms used within S1000D (Chap 9.2). The definitions for XML data elements are given in Chap 9.3.

| Chap 2.5.2 | Business rules - Generation and use |
| Chap 3 | Information generation |
| Chap 4 | Information management |
| Chap 7 | Information processing |

## 1 General

This chapter gives a basic introduction to business rules and where to find information to tailor S1000D for a specific project or organization.

## 2 Content

This specification has been produced to cater for many different types of products. Therefore, to make it suitable for a given project or organization, some aspects of tailoring will be required. It is recommended that the tailored version of this specification is referred to in the project's contractual documentation. This tailoring must not affect the XML Schemas or its basic philosophies but must be restricted to tailoring within the narrative specification.

Project business rules must be agreed between parties to document the details of the agreed tailoring of this specification. These rules must cover the requirements for optional elements, their population from specific data sources, and the use of specific values.

Chap 2.5 defines the term "business rules" and describes standardization of the business rules scope within S1000D. Chap 2.5.1 groups various business rules into categories and introduces the construct of business rules layers, which describes various organizational and project levels at which business rules are produced. Chap 2.5.2 addresses the mechanisms of business rules generation and use.

Chap 4 includes a description of the BREX mechanism provided to record and exchange specific business rules between parties involved in a project.

Chap 3 thru Chap 7 give guidance on the project specific business rules decisions.

## 1 General

Proposals to amend S1000D must be submitted in the full knowledge that all users, both military and industrial, can be affected by changes to the specification, and will be accepted only under international agreement.

The maintenance of this specification is vested in the S1000D Steering Committee who will obtain agreement from the participating organizations prior to publication of changes. The S1000D Steering Committee considers change proposals at each meeting and may ratify them for incorporation in the specification. The S1000D Steering Committee also decides when changes will be published in S1000D.

Any queries or proposals relating to changes to the specification must be addressed to the S1000D Steering Committee using the online CPF facility which can be found at www.s1000d.org.

Proposals from the S1000D member nations and organizations must follow the process outlined below.

Copies of the specification can be obtained at www.s1000d.org.

# 2 Online change proposals

## 2.1 Convention

The online change proposal facility uses two conventions for CPF, which are explained in detail on the web site:

| | |
|---|---|
| Proposal | A CPF that is in draft |
| CPF | A CPF that is formally submitted to the S1000D Steering Committee |

## 2.2 Tiers

There are two tiers to the online CPF facility. These are explained in detail on the web site. The lower tier is used for drafting proposals and the upper tier is used for S1000D Steering Committee review of formal CPFs. The upper tier is available for public view, so that members can see what changes are being proposed.

## 2.3 Groups

Access to the lower tier is obtained by being a member of a group. Groups are made up by nation and organization and comprise their members. A CPF can only be submitted by these groups. It is possible to be a member of more than one group. See your national or organizational representative, which are listed on the web site, to become a member of a group.

## 2.4 Roles

Within each group, only the administrator role can promote a draft CPF to a formal status of "New" for the S1000D Steering Committee to review.

## 2.5 CPF cycle

### 2.5.1 Creation

There is a process that is explained in detail on the web site. This creates the proposal in the national or organizational lower tier.

### 2.5.2 Workflow

There are two types of workflow:

- Pre-submittal
- S1000D Steering Committee

#### 2.5.2.1 Pre-submittal workflow

The pre-submittal is where draft proposals are developed. Group administrators can set pre-submittal statuses to suit their own group's workflow.

#### 2.5.2.2 S1000D Steering Committee workflow

The S1000D Steering Committee workflow moves through the statuses that are defined on the website.

## 1 General

This chapter describes the relationship between the S1000D process and processes from other specifications and standards, eg S2000M, ISO 10303 AP 239 (PLCS).

## 2 S2000M

Both S1000D and S2000M use the same rules for model identification coding. They also both use the same illustration rules as defined in Chap 3.9.2.

There are two methods for producing IPD, historically known as the Illustrated Parts Catalog (IPC):

- the "traditional" method (ie compilation by authors from parts source data or generated/supported from project specific parts databases)
- the extraction from an S2000M database

These are described in detail in Chap 5.3.1.3.

# 3 ISO 10303 AP 239 - PLCS

A set of data exchange specifications to establish the relationship between S1000D and PLCS is under development.

Information about PLCS can be found at www.oasis-open.org.

# 4 SCORM

The relationship between S1000D and SCORM has been established so that training content can be developed using the data module concepts of S1000D. Specifically, a new data module type has been added to capture the five different learning information types (refer to Chap 3.9.5.2.13). Also, to provide the link to the SCORM LMS, connectivity is provided thru the LOM in the new SCORM content package module.

Information about SCORM can be found at www.adlnet.gov.

| Chap 2.5.2 | Business rules - Generation and use |

## 1 General

The goal of this chapter is to categorize various types of information contained in business rules specified by a project or an organization. This chapter also addresses the standardization of S1000D business rules generation and use within an S1000D project.

Chap 2.5.1 introduces and explains business rules categories and layers.

Chap 2.5.2 describes the methods for business rules generation and use.

## 2 Business rules

### 2.1 Definition

Business rules are decisions that are made by a project or an organization on how to implement S1000D. Business rules cover all aspects of S1000D and are not limited to authoring or illustrating. They can also address issues that are not defined in S1000D such as rules related to how S1000D interfaces with other standards, specifications and business processes that are related to its implementation.

### 2.2 Business rules decision points

Throughout the specification, in particular the authoring chapters, business rule decision points have, wherever possible, been identified. However, in many cases, they have been marked as "None identified". Projects and organizations must still decide for themselves whether certain business rules decisions must be made in these cases.

# 1 General

This chapter introduces the concepts of business rule categories and layers that exist in S1000D.

Grouping business rules into categories will help projects and organizations to differentiate between, and understand, the relevance of various business rules, as well as to be able to group them in certain classes. This classification is made to help standardize business rules scope.

S1000D recognizes that a number of decisions related to its implementation are made not only on a project level but often also on an organizational level (eg national Ministries or Departments of Defense (MoD or DoD), international consortia such as Civil Aviation Working Group (CAWG), etc). The structure and content of business rules between projects and various organizations can differ considerably.

In support of the business rule categories, a layered model of business rules is introduced.

Introduction of the layered model implies that business rules can be written not only for a project but also for an organization. Various layers of business rules can also be arranged in a certain hierarchy that is appropriate for the implementation. Each layer of this hierarchy represents one of the business rules decisions to be made by a project or an organization.

It is possible that business rules on different layers contain redundant and/or conflicting business rules. Additionally, the layered structure of business rules usually has a tree-like structure rather than a one-dimensional layered form. Any change in a higher level business

rule required by a lower level of the business rules hierarchy can be in conflict with the related business rules of the other layers. Para 5 of this chapter points out various conflicting aspects in business rules creation and provides guidance as well as recommendations to avoid these conflicts.

# 2 Business rule categories

A business rule category is a unique grouping that describes rules applicable to product definition, maintenance philosophy, concepts of operation, security, business processes, data creation, data exchange, data integrity, data output and/or legacy data conversion, management, handling and other issues.

Ten different business rule categories have been identified. These categories are defined to ensure that business rules developers consider all major business rules decisions within S1000D. Each sample business rule is assigned to one business rule category. Some business rules can belong to one or more categories. Apart from that, the business rule categories cannot be considered in isolation from each other. They relate to and complement each other (eg data exchange, data integrity and management business rule categories as shown in Para 2.8, as well as data creation and data output business rule categories as shown in Para 2.10). The business rule categories are identified in Fig 1.

ICN-83007-S1000D001-001-01

*Fig 1 Business rule categories*

The examples given after the definitions of each business rule category in Para 2.1 thru Para 2.10 are not exhaustive and are only intended to provide the reader with a guide how these categories of rules can be covered. The word "must" means in this example that a certain business rule must be followed only by this particular example project or organization.

## 2.1 Business rule category 1: General business rules

### 2.1.1 Definition

General business rules cover all decisions made by a project or an organization that are not covered by any of the specific business rule categories below. They serve as overall decisions for the implementation of S1000D.

These decisions include but are not limited to:

- decision on which issue of S1000D to be implemented
- identification of the parts of S1000D to be used and implemented in the project
- definition of terms used throughout the project, so there is a clear understanding of their meanings

### 2.1.2 Examples

- **Decision example on an organizational level:** The technical documentation of all new vehicles must be produced to S1000D Issue 2.1 and higher.
- **Decision example on a project level:** The whole technical documentation in this project must be realized on the basis of S1000D Issue 2.1. Exceptions/Additions: Authoring rules for wiring will be adopted from S1000D Issue 2.2. Layout rules will be implemented on the basis of S1000D Issue 2.3, …

## 2.2 Business rule category 2: Product definition business rules

### 2.2.1 Definition

Product definition business rules cover the data module coding strategy related to how the Product is broken down (eg physical or functional). Included is the definition of the model identification codes to be used in the Product and its subsystems. Supplier subsystems and identifications also need to be considered.

The project specific SNS is defined normally in conjunction with the product breakdown structures defined by engineering or design. The SNS specification is a set of information that is produced to detail these rules.

Applicability rules are also defined in this category.

To summarize, the product definition business rules include but are not limited to:

- model identification codes for the Product and its subsystems and components
- system difference code
- material item category code
- SNS specification (decision on which SNS scheme to be chosen or defined)
- disassembly code
- disassembly code variant
- applicability rules

### 2.2.2 Examples

- The rules for the data module coding strategy related to the product breakdown are defined in the project BREX data module.
- The permissible model identification codes for this project are "1B" for airframe, "E2" for engine.
- A list of SNS together with technical names and data module types is given in Data Module Code (DMC)-(XXXX).
- The rules for applicability are as follows:
  - The model of bicycle must be "Brook trekker" or "Mountain storm".
  - The version of bicycle must be "Mk1" or "Mk9"...
  - The serial number must be "001" thru "999".

## 2.3 Business rule category 3: Maintenance philosophy and concepts of operation business rules

### 2.3.1 Definition

Maintenance philosophy and concepts of operation business rules cover the types of information that a project or an organization requires. They include for example a list or detailed

specification[1] of chosen information sets, an information codes specification which details the information codes, and information names that describe the data module content.

A definition of the required item location codes is also included.

The maintenance philosophy and concepts of operation business rules are determined by the contract (eg is first, second and third maintenance level information to be delivered?)

Definition of these rules must be performed in conjunction with operation, maintainability, repair and other aspects of LSA.

The data module coding strategy for the definition of information codes, information code variants and item location codes is included in this category. This ensures that the information codes, information code variants and item location codes match with the product definitions for each level within the breakdown of the technical documentation decided upon within the general business rules category (BR category 1).

Training and skill levels are also defined or identified by this category.

To summarize, the maintenance philosophy and concepts of operation business rules include but are not limited to:

- list of relevant information sets given in Chap 5 or modified information sets
- detailed specifications of project specific information sets
- list or (detailed) specification of information codes and information names to be used in the project
- item location codes to be used
- specification of the depth of information to be delivered iaw the maintenance level
- matching the information codes and item location codes to the breakdown part of the data module code as defined within the product definition business rules (BR category 2)
- decision on how to apply information code variants
- training and skill levels

### 2.3.2 Examples

- A list of allowed information codes together with information names and data module types is given in…
- The mapping between the breakdown part of the data module code (model identification code, system difference code, SNS, disassembly code and disassembly code variant) and the information part (information code, item code variant and item location code) of the data module code as well as the data module types is given in…

## 2.4 Business rule category 4: Security business rules

### 2.4.1 Definition

Security business rules cover all security issues. They include security classifications, copyright markings, use or disclosure restrictions, destruction instructions and any other data restrictions.

There are also issues concerning data creation access. For example in multi-partner projects, the Product is broken down into areas of responsibility. It is possible that the organization of the multiple partners means that write access can be provided only to the design authority of a data module.

The rules concerning data access during production must be considered here (eg who is allowed to edit a data module or an illustration?). It is important that these rules are established first. These rules do not explain job roles, positions and accountability/responsibility but define which roles have what rights with respect to viewing, creating and modifying data.

[1] It is up to the project or the organization to decide where within this BR category the detailed information is maintained.

Special consideration must be given to national security restrictions.

The creation of security business rules is performed using the project security instructions.

To summarize, the security business rules include but are not limited to:

- security classifications and the definitions of their use
- copyright markings
- use of disclosure
- destruction instructions and suitable methods
- national security restrictions
- specific project security instructions (if available)
- other restrictions
- specification of access to various "classes" of data modules

### 2.4.2 Examples

- The values of the security classification attribute and their interpretation are listed in Table…
- (LP) Compressor data modules must always be North Atlantic Treaty Organization (NATO) Restricted…
- Inline security markings must not be used.
- Only (XXX) authors are allowed to edit / view data modules with responsible partner company (YYYYY) when they are located in the Peterborough office.
- Data modules marked NATO Restricted must not be exchanged with XXXX.

## 2.5 Business rule category 5: Business process business rules

### 2.5.1 Definition

Business process business rules cover how technical publications development is coordinated with other disciplines within an organization or within the project level at that organization or the project as a whole. For example, they describe the rules and relationships with LSA, S2000M compliant initial provisioning, engineering/design and training (eg SCORM conformance).

The rules for QA must be considered as well as the interaction between the organization, its partners and suppliers.

When there is a requirement to produce training content using S1000D, rules must be established that satisfy both the content development needs of instructional designers (on the learning side) and the authors (on the maintenance and operation side) who support a common system.

In addition, business rules and processes must be established to ensure that instructional designers and technical writers collaborate to preplan for reusable content.

These rules also take into account the data module coding strategy to achieve:

- the optimal reusable data granularity for screen presentation in learning products and the system maintenance philosophy for presentation in IETP
- the development of maintenance, operational and learning content for use in interactive multimedia and simulations
- the process of developing the appropriate amount of data modules that meet the intended need of a SCO in SCORM
- the relationship between data module/publication module codes and the requirements for learning content registration

To summarize, the business process business rules include but are not limited to:

- input and output definition of other disciplines into technical publications
- order of project hierarchy for deliverables and input from subcontractors

- agreed workflow procedures between Original Equipment Manufacturer(OEM), subcontractor and customer
- approved integration methods with external systems (eg logistic databases)
- verification rules with respect to interaction between the organization, its partners and suppliers related to QA
- preplanning, reusability and interoperability rules

**2.5.2 Examples**

- When mapping LSA task codes to data module codes, the following rules apply…
- Graphics extracted from the Computer Aided Design System (CADS) must use these parameters for use in publications...
- When a data module is ready for exchange, it must receive a verification certificate from engineering. After this is received, mark the data module as first verified...
- When the customer supplies a verification certificate, increment the issue number of the data module with issue type "status" and set QA to second verified.
- The data module is ready for QA at this specific point and these are the steps to be followed for verification.
- Initial provisioning data must be coded in conformance with S2000M version…
- The values of the following elements and attributes in the IPD Schema must be imported from S2000M version X.X, Chapter 1 Initial Provisioning.
- Training data modules must use only the following learn codes…

## 2.6 Business rule category 6: Data creation business rules

Data creation business rules give information about the creation of text, illustrations and multimedia objects.

The data creation business rules include:

- rules for creating textual data
- rules for creating graphics, 3D content and multimedia objects

### 2.6.1 Business rule category 6a: Data creation business rules - Text

2.6.1.1 Definition

Text creation business rules consist of rules and guidelines (including terminology rules such as language and dictionaries, and the order of preference) for maximizing the amount of reuse that can be achieved within technical publications, and between technical publications and supporting training content.

Text creation business rules provide rules and guidance how the technical and learning content is to be developed. They also specify eg the use of dictionaries, how numbers must be expressed, how the author must refer to technical terms, how multimedia, maintenance, operational and learning content is to support IETP and training, and the establishment and use of a terminology database.

Markup business rules provide information about which markup elements and attributes must be used and populated. These rules are often project or organization specific.

To summarize, the data creation business rules for text include but are not limited to:

- writing rules (including terminology rules, use of dictionaries, rules for numbers, etc)
- markup rules
- requirements for text incorporation in multimedia objects

2.6.1.2 Examples

- The Simplified Technical English (STE) dictionary, ASD-STE100, must be used.
- The list of technical terms is given in…
- All fault data modules must have their fault codes listed in the fault code index.

- Data module titles must be in title case.
- Names used in the list of support equipment, list of spares and list of supplies must be the full name as specified in the S2000M database. When referring to these tools, spares or supplies in the procedure, use the corresponding name.
- The applicability block markup requirements are…
- The element `<techStandard>` must not be used.

### 2.6.2 Business rule category 6b: Data creation business rules - Illustrations and multimedia

2.6.2.1 Definition

Illustration and multimedia creation business rules cover the creation of illustrations and multimedia objects. They are divided into style, detail and data format.

Data style rules for illustrations and multimedia objects govern characteristics such as illustration sizes, use of color, line weights, fonts, projection methods (isometric or trimetric), etc.

The rules for illustrations cover for example the use of hotspots.

Data format rules cover the formats in which the information must be stored. For a CGM illustration, this will cover the elements that are permitted (eg coordinate types, polylines, restricted text). For raster images it can include the resolution and orientation. It is often difficult to separate style from format.

To summarize, the data creation business rules for illustrations and multimedia objects include but are not limited to:

- graphic style rules
- interactivity detail rules
- multimedia format rules
- linking rules

2.6.2.2 Examples

- The rules for 2D are…
- The rules for 3D are…
- Trimetric projection must be used for…
- Photographs are permitted for...
- Joint Photographic Experts Group (JPEG) format must be used for…
- The image size must be…
- Raster image resolution must be a minimum of 300dpi…
- Simulations will be produced in Flash™…

## 2.7 Business rule category 7: Data exchange business rules

### 2.7.1 Definition

The rules for how data must be exchanged between partners and customers are covered in business rule category 7. This includes for example the use of data dispatch notes and how data module requirement lists as well as CSDB status lists are used. The rules in this category include how the S1000D file based transfer protocol is used, the frequency of data exchanges, if unverified data are exchanged, the rules for data module and graphic issue numbers, and the acceptance and rejection criteria.

To summarize, the data exchange business rules include but are not limited to:

- rules for use of data dispatch notes
- rules for the use of data module requirements lists
- rules for CSDB status lists
- rules for the usage of the file based transfer protocol
- agreement on the frequency of data exchanges
- rules for data module issue numbers

- rules for information objects coded with an ICN
- agreed criteria for acceptance and rejection

### 2.7.2 Examples

- Data must be exchanged using the S1000D file based transfer method.
- Comments and data module lists must be exchanged in separate packages.
- The data dispatch note must conform to the following business rules…
- Data module deliveries will occur once per calendar month.
- Following each exchange, a CSDB status list must be produced and verified before any further exchanges can occur. The business rules for CSDB status lists are...
- The exchange of unverified information is not allowed.

## 2.8 Business rule category 8: Data integrity and management business rules

### 2.8.1 Definition

Data integrity and management business rules enforce the referential integrity within the CSDB. Closely coupled with the data exchange business rules (refer to Para 2.7), they cover how data is managed by both the creator and the customer.

If necessary, this category can include rules defining processes for submission and acceptance of non-compliant data when suppliers are unable to produce S1000D compliant data.

The workflow business rules (both internal and external) and the rules for QA are also covered in this category. These are also connected to the data exchange business rules.

To summarize, the data integrity and management business rules include but are not limited to:

- workflow business rules (both internal and external)
- QA business rules

### 2.8.2 Examples

- Gaps in data module issue numbers are not allowed.
- No data modules will be accepted unless all referenced illustrations are contained in the exchange package.
- All data modules and graphics must pass the business rules criteria before they can be accepted.

## 2.9 Business rule category 9: Legacy data conversion, management and handling business rules

### 2.9.1 Definition

Legacy data conversion, management and handling business rules are quite separate from the other categories outlined above and can be considered (to some extent) as being outside of the scope of S1000D. They cover rules for converting data from say, an ATA iSpec 2200 project, to data modules and will vary from project to project depending on the format of the source data (word processor, paper, Standard Generalized Markup Language (SGML)), and how the target data modules must be treated.

To summarize, the legacy data conversion business rules include but are not limited to:

- conversion rules (including mapping between elements and attributes of source and target specifications)
- rules for inclusion of legacy information in a technical publication

### 2.9.2 Examples

- Maintenance handbooks will be converted into data modules using the descriptive and procedural schemas.
- The following ICN codes apply to the operator’s handbook No. (XXXXX)…

## 2.10 Business rule category 10: Data output business rules

### 2.10.1 Definition

Data output business rules specify the output formats for S1000D data. These formats can include page-oriented (eg paper) formats, IETP formats, multimedia formats and SCORM formats. The decision regarding which portion of the data will be published in what formats must be agreed and written within these business rules.

These rules include details on how to style element and attribute content. The data creation business rules (especially for text, business rule category 6a) are strongly related to this business rule category. For example, the authors need to know to which elements there is generated text in order to avoid authoring redundancies and inconsistencies after publication generation.

Where required, a project functionality matrix is created according to the recommendations given by the S1000D functionality matrix (refer to Chap 6.4). Decisions made in completing a project functionality matrix will have direct impact on data output rules.

To summarize, data output business rules include but are not limited to:

- decisions regarding which portion must be in paper (or page-oriented) and which in IETP
- presentation rules for paper (or page-oriented) and IETP output
- decisions regarding which data modules will be output in SCORM format
- decisions regarding which data modules will be output in simulations
- look and feel business rules

### 2.10.2 Examples

- The S1000D standard page-oriented layout in Chap 6.2 must be used for page-oriented presentations.
- For hardcopies printed from the IETP, the following time expiry message must be printed on the top of each page: XXXXXXX as shown in YYYYY.
- All learning data modules will be output in SCORM format.
- Maintenance data will be incorporated into system simulations.
- Warnings must be according to the symbolic warning type described in Chap 6.2.2.
- Random list item elements that have prefix pfxxx must have a 26pt bullet character (•) printed before the item or the first bullet of the item.
- The page size for printed output is A4 and A3 for foldouts.

# 3 Sequence of business rules generation

An exact timeline for project business rules production can be defined only by a project or an organization (by the latter often only to some extent). This specification can only give an example for the sequence of business rules elaboration. Fig 2 presents such an example.

ICN-83007-S1000D002-001-01

*Fig 2 Example sequence of business rules production relative to the business rule categories*

Fig 2 illustrates the example sequence of the business rules generation process in relation to business rule categories. It neither implies when business rules are generated nor does it indicate when authoring of technical data begins. These issues will be discussed in more detail in the implementation guide (refer to Chap 2.4).

At this point, it is important to emphasize that it is up to the project or the organization to decide when to produce a certain category of business rules. In general, the following recommendation applies:

– the more thorough the business rule planning before contracting and content development, the more successful the implementation

In practice, various experiences have been gathered:

– thorough contracts that include required project business rule decisions on model identification codes, on SNS structures
– brief contracts for technical documentation claiming only S1000D conformance and leaving many decisions up to a later stage in the project (eg authoring)

The success of both depends on the communication and agreement practices between the project partners.

It is also important to stress the dynamic life of business rules. They must be reviewed on a regular basis throughout the lifecycle of a Product and must be updated accordingly.

Another important issue is that some business rules and parts of them can only be written after the acquisition process is completed. This is not only limited to acquisition but also changes throughout the lifecycle.

# 4 Business rules layers

## 4.1 Definition

A business rules layer indicates the level of stakeholders within the hierarchy to which the business rules apply.

## 4.2 Business rules layered model

The layering of business rules can be shown as a layered model with each layer ‘inheriting’, ‘extending’ and ‘profiling’ the upper layer. Fig 3 shows a general view of the layered model. Layers two to N vary in accordance with the organization and/or project structure. The core of the uppermost layer of the model is always represented by S1000D itself. Progressing through the "lower" layers, the number of business rules grows and the number of decision points remaining decreases. The reason for this is that an organization and/or a project inherits all business rules from the upper layer and decides which of the remaining decision points are relevant at their level. The goal is to have all decisions made prior to reaching the author's level and at the very least to keep any decisions at the author's level to a minimum.

ICN-83007-S1000D003-001-01

*Fig 3 The layered business rules model*

The project or the organization can add or define their own decision points at their layer.

Every available decision point must be considered at each layer.

Fig 4 and Fig 5 show examples of the layered business rules model for a defense and a civil aviation project, respectively.

In the example of Fig 4 the organization (department) level is below national defense business rules (eg business rules of Air Force, Army and Navy organizations or departments). The "lowest" layer (in this example the authors’ business rules) must only contain minimum open decision points.

ICN-83007-S1000D004-001-01

*Fig 4 Example of a six-layered defense business rules model*

ICN-83007-S1000D005-001-01

*Fig 5 Example of a three-layered civil business rules model*

The civil aviation business rule layer is used to define a comprehensive set of business rules that will remain consistent across all civil aviation industry applications. The project layer is used to define project specific business rules not previously covered.

Layering is only one dimension of the business rules "cascading" structure. An alternative representation of business rules is a tree-like structure. Fig 6 presents an example of such a tree-like business rules structure. Along the "vertical" axis in this figure, the layering as shown above can be easily recognized. Across the figure, "branches" representing various "parallel" departments/organizations (in Fig 6: Army, Navy and Air Force) with their own projects situated at the same level with their "counterparts" but having different "commitments", can be clearly seen. All of them inherit business rules of the upper level and make their own independent decisions on the remaining decision points. Although these business rules seem to be perfectly

independent from each other at a first glance, a change of national MoD/DoD rules, for example raised by one of the departments, will require review and agreement by the other departments.

ICN-83007-S1000D006-001-01

*Fig 6 Example of a defense tree-like business rules model*

# 5 Resolving conflicting business rules

As described above in Para 4, the business rules in the lower ("children") layers must adopt or must be conformant to the business rules of the higher (their "parent") layer. This can for example cause a problem when the same technical data are delivered to more than one customer. In some cases, due to conflicting business rules, data modules must be rewritten, filtered or processed to make the data module variants conform to the rules demanded by each customer (refer to Chap 4.12).

Consider the national defense layer shown in Fig 4. For a multi-national project, it is most likely that the business rules demanded by each nation are different to various other nations' DoDs/MoDs. In other words, there is again a "tree"-like business rules structure with "branches" situated at the same layer but having separate business rules definitions for this particular layer. This kind of situation can demand a potential rewrite of information. The amount of the information to be rewritten can be considerable. In order to avoid or diminish this effect, common areas between national business rules are recommended to be considered and harmonized/brought into consensus for a given project before any authoring commences.

Similar problems can occur in the project layers when the same Product is used in different projects (refer to Fig 7 for an example). Consider an engine that is used in different airframes where one airframe manufacturer imposes different rules than another. Another example is when a given Product is used for both civil and military use, which can mean data rewrites. A consensus/harmonization to minimize data rewrites for a given project is vital.

Before any authoring or implementation of S1000D begins on a project, all stakeholders who have their own business rules must reach consensus on the business rules to be deployed for that project.

This has adverse affects on costs and data redundancy. Business rule developers must keep this in mind. Lower layers (if available) must be taken in consideration while producing business rules at a given layer. If possible, participants from all layers must be involved in the production of the business rules. Developers of business rules must carefully consider the impact on reuse between projects and the potential for multiple customers and users of project data.

As a minimum requirement, the higher layers are responsible for informing the lower layers on their business rules. For example, organizations must provide information to projects, which organizational business rules must be followed and which decision points are up to the projects.

When projects are presented with conflicting business rules from multiple customers or parent organizations, projects must resolve these conflicts. These conflicts must be resolved by:

- coordinating a change or waiver to the conflicting rules with one or more of the customers or parent organizations
- producing data modules to comply with each set of rules

ICN-83007-S1000D007-001-01

*Fig 7 Example of business rules conflicts*

## 1 General

This chapter provides an introduction to the chapters that describe how information is generated in an S1000D project.

## 2 Content

Information required to support the Product must be produced, as discrete pieces of information called data modules, and stored in a CSDB as described in Chap 4.2.

This chapter provides general rules, which apply to technical information produced in that manner.

All data modules have a basic structure which is fully defined in Chap 3.2.

Information sets are used to establish the required scope of the information and data module coding strategy. The use of information sets is fully defined in Chap 3.3. Depth of information is defined as a combination of the breakdown (as represented by the SNS and disassembly code and described in Chap 4.3.3 and Chap 4.3.4) and the requirements of the Product maintenance policy.

For the purposes of dividing the Product into zones for maintenance and detailing access, the rules are given in Chap 3.4.

The issues surrounding the updating of data modules are explained in Chap 3.5.

The rules for the allocation for the protective marking of data modules that reflects their security classification, etc are detailed in Chap 3.6.

During the development and update of data modules/publications, QA procedures are required to ensure that the contents of the data modules are adequate and technically accurate. Details of these procedures are given in Chap 3.7.

Data modules must reflect the breakdown of the Product. The initial breakdown is described by the SNS. Further disassembly is then as detailed in Chap 3.8.

All data modules are produced in accordance with structural rules. These are reinforced by writing and illustration rules, together with front matter and warnings, cautions and notes. The rules are supported by specific guidance for authoring data modules. These rules are given in Chap 3.9.

| Chap 3.9.5.2.1.1 | Common constructs - Change marking |
| Chap 3.9.5.3 | Data modules - Applicability |

## 1 General

This chapter explains the general structure of a data module. There are a number of data module types, which are appropriate for use in the production of all technical information required in operation and maintenance of the Product.

## 2 Basic structure

All data modules have a basic structure, which is comprised of two sections:

- identification and status section, which is defined in Chap 3.9.5.1
- content section, which is defined in Chap 3.9.5.2

## 2.1 Identification and status section

The identification and status section is the first part of a data module.

It contains identification data (eg data module code, title, issue number, issue date, language) and status data (eg security classification, responsible partner company and originator, applicability, technical standard, QA status, skill, reason for update). Specific details are given in Chap 3.9.5.1.

The identification and status section provides data that can be used for:

- management of the data module within the CSDB
- management of the use of applicability
- management of the quality control process
- management and control of retrieval functions
- automatic compilation of sets or subsets of information
- general information for users accessing the CSDB

### 2.1.1 Applicability

The overall applicability for an entire data module is captured in the identification and status section and is explained in Chap 3.9.5.3.

### 2.1.2 Security classification

The general rules for security classifications are explained in Chap 3.6. The detailed application of security classifications for an entire data module is captured in the identification and status section and is explained in Chap 3.9.5.1.

### 2.1.3 Quality assurance

The process for QA is explained in Chap 3.7.

### 2.1.4 Reason for update

The reason for update of a data module can be captured in the identification and status section. The reason for update is a summary of the changes, and/or reasons for change, made within the data module and is explained in Chap 3.9.5.1.

## 2.2 Content section

The content section is the second part of a data module. It contains the text and illustrations that is presented to the user. The different types of the content section and their use are described in Chap 3.9.5.2.

### 2.2.1 Applicability

The inline applicability can be allocated to defined elements within the content section and is explained in Chap 3.9.5.3.

### 2.2.2 Security classification

The inline security classification can be allocated to defined elements within the content section and is explained in Chap 3.9.5.2.1.

### 2.2.3 Reason for change

Within the content section, changes can be identified and this can include the reason for change. Details of how to apply change is explained in Chap 3.9.5.2.1.1.

# 1 General

The complete production process involves agreeing the purpose, scope and depth of the technical information, establishing the business rules for data module coding, generating a data module requirements list, producing and publishing the data modules. Information sets are provided to assist the generation part of the process.

# 2 Information sets

These define the purpose, scope and depth of the technical information that is to be produced for operation and maintenance of the Product and subsequently establishing the basic data module requirement list. The content of information sets is described in Chap 5.2. They can also be used for the definition of the publications that are generated as the final deliverable, as described in Chap 5.3.

## 2.1 Common information sets

A number of information sets are considered to be appropriate for use on the Product. These information sets are shown in Table 2 and explained in Chap 5.2.1.

*Table 2 Common information sets*

| Information set | Chapter |
|---|---|
| Crew/Operator information | Chap 5.2.1.1 |

| Information set | Chapter |

| Training | Chap 5.2.1.19 |
| List of applicable publications | Chap 5.2.1.20 |
| Maintenance checklists and inspections | Chap 5.2.1.21 |

## 2.2 Information sets for air systems

The additional specific information sets for air systems are given in Chap 5.2.2.

## 2.3 Information sets for land and sea systems

Since the range of the Product within land/sea systems is so varied, it is impracticable to define one suite of information sets that is appropriate to all land/sea systems. Therefore, for land/sea systems, the project or the organization must define the information sets that are appropriate to their projects. However, to assist with this, a suite of information sets has been provided which can be used. In either case, the project specific information sets must be agreed between the customer and the contractor.

The concepts for the additional information sets for land/sea systems are given in Chap 5.2.3.

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Definitions of information sets**. The project or the organization must decide on which information sets are used and the definition of their content. Refer to Para 2 and Chap 5.2.

**Agreement on project specific information sets**. The project or the organization must agree with the customer on the project specific information sets. Refer to Para 2.

# Chapter 3.4

# 1 General

To help in locating the Product equipments, assemblies, access doors and panels, ports, etc within data modules and identifying locations for maintenance planning, the Product is divided into areas and sub-areas known as zones.

It can be noted that when zoning and access information is a requirement for data modules, the principles and requirements as provided in this chapter must be used by the Product contractor's design authorities in the design stage of the project.

Zoning and access identification systems can vary between types of the Product, due to different manufacturing build systems.

# 2 Zoning requirements

The zoning identification system must be simple, logical in arrangement and suitable for inclusion in data processing systems.

A zone is identified by a standard number consisting of three digits. The first digit is used to indicate the major structural area of the Product. The second digit indicates zones and on which side of the center line (if any) the zone is located. Odd digits apply to left side facing forward, even digits to right side. Zones which are situated over the center line can be allocated numbers which are odd or even. The third digit is used to indicate sub-zones.

Fuselages/hull zones must be allocated longitudinally from forward to aft. Vertical allocation is for the Product with a floor as separation between upper and lower compartments upwards or downwards from that floor and for other types of the Product from the top to the bottom.

Major structural components such as entrance doors, cargo doors, landing gear, landing gear doors, control surfaces, etc must have individual zone numbers.

Wherever possible, the boundaries of zones can be related to actual physical boundaries of compartments or components such as wing spars, ribs, fuselage/hull frames, turrets, bulkheads or longerons, areas of skin or control surface edges. Internal boundaries based on structural components are generally more valuable.

Compatibility must be maintained between all versions of the Product wherever possible. Major changes in construction will necessitate the allocation of new zone numbers specific to the version.

Zone charts and diagrams must clearly indicate zone boundaries and their station numbers. A physical description of the zone boundaries must be provided.

Zoning allocation in the fuselage/hull must not divide major compartments, which are separately zoned.

Zone boundaries must embrace related structures such as door frames. A door frame for a specific door must not be divided between zones.

Doors such as cabin doors, cargo doors and main landing gear doors are themselves zones.

## 2.1 Zoning of air systems

### 2.1.1 Air-specific zoning requirements

Wing zones must be allocated from the root to the tip and from the forward to aft. This method of allocation is also to apply to horizontal and vertical stabilizers and to all auxiliary stabilizers and strakes.

Wing leading and trailing edges, wheel wells, fuel tanks, accessory (mission equipment) compartments, the flight compartment/cockpit, toilets, galleys and other possible areas of congestion during maintenance must be suitably zoned to define the work area.

Areas between aerodynamic components and the fuselage, enclosed by fillets, must be considered fuselage zones.

When the air vehicle design incorporates a center wing, which is located within, or is integral with, the fuselage, the center wing must be considered a fuselage zone.

### 2.1.2 Zone identification

As already indicated, within the requirements of zoning, different zone identification systems can be applied. The following examples of zoning systems are typical for a transport air vehicle (Method A), for a fighter air vehicle (Method B), and for a helicopter (Method C).

#### 2.1.2.1 Method A

Method A is shown in Fig 1. The major areas must be identified as shown in Table 2.

*Table 2 Major areas (zones) - Method A*

| Major area (zone) (Standard number grouping) | Area |
|---|---|
| 100 | Lower half of fuselage, below the main cabin deck rearward to the aft pressure bulkhead |
| 200 | Upper half of fuselage, above the main cabin deck rearwards to the aft pressure bulkhead |
| 300 | Empennage |
| 400 | Power plants and engine pylons |
| 500 | Left wing |
| 600 | Right wing |
| 700 | Landing gear and associated doors |
| 800 | Doors (load carrying, pressure barrier or latching) |
| 900 | Reserved for major differences in models, versions or series of the same air vehicle type not covered by the standard number groupings |

Zones in major areas (eg 200, 300) must be subdivided into zones using the second element digit of the standard number grouping. As an example, Zone 300 can be subdivided as shown in Table 3.

*Table 3 Major sub-zones*

| Major zone | Major sub-zone | Area |
|---|---|---|
| 300 | | Empennage |
| | 310 | - Fuselage aft of the pressure bulkhead |
| | 320 | - Right vertical stabilizer and rudder |
| | 330 | - Left vertical stabilizer and rudder |
| | 340 | - Right horizontal stabilizer and elevator |

| Major zone | Major sub-zone | Area |
|---|---|---|
| | 350 | - Left horizontal stabilizer and elevator |

The major sub-zones must be subdivided into zones using the third element digit. A possible subdivision of a major sub-zone is given in Table 4.

*Table 4 Zone No.*

| Major sub-zone | Zone No. | Area |
|---|---|---|
| 320 | | Right vertical stabilizer and rudder |
| | 321 | - Right vertical stabilizer leading edge |
| | 322 | - Right vertical stabilizer auxiliary spar to front spar |
| | 323 | - Right vertical stabilizer front spar to rear spar |
| | 324 | - Lower rudder |
| | 326 | - Upper rudder |
| | 327 | - Right vertical stabilizer tip |

Major zone 100 fuselage under floor
Major zone 200 fuselage above floor
Major zone 300 empennage
Major zone 400 power plants and pylons
Major zone 500 left wing
Major zone 600 right wing
Major zone 700 landing gear and landing gear doors
Major zone 800 doors (passenger/crew, baggage and emergency)

ICN-AE-A-000402-G-S3627-00012-A-01-1

*Fig 1 Example of zoning a transport air vehicle (Method A)*

2.1.2.2 Method B

Method B is shown in Fig 2. The major areas must be identified as follows:

*Table 5 Major areas (zones) - Method B*

| Major area (zone) (Standard number grouping) | Area |
|---|---|
| 100 | Front fuselage |
| 200 | Center fuselage |
| 300 | Rear fuselage |
| 400 | Wings |
| 500 | Tail (empennage) unit |
| 600 | Pylons/Stubwings |
| 700 | Canards/Strakes |
| 800 | Doors (load carrying, pressure barrier or latching) |
| 900 | Reserved for major differences in models, versions or series of the same air vehicle type not covered by the standard number groupings |

Zones in major areas (eg 200, 300) must be subdivided into zones using the second element digit of the standard number grouping. As an example, Zone 100 can be subdivided as follows:

*Table 6 Major sub-zones*

| Major zone | Major sub-zone | Area |
|---|---|---|
| 100 | | Front fuselage |
| | 110 | - Radar bay |
| | 120 | - Forward equipment and IFR probe compartment |
| | 130 | - Front cockpit |
| | 140 | - Rear cockpit |
| | 150 | - Nose wheel compartment |
| | 160 | - Ventral bay |
| | 170 | - Left hand side compartment |
| | 180 | - Right hand side compartment |
| | 190 | - Rear compartment and tank |

The major sub-zones must be subdivided into zones using the third element digit. A possible subdivision of a major sub-zone is given below:

*Table 7 Zone No.*

| Major sub-zone | Zone No. | Area |
|---|---|---|
| 120 | | Forward equipment and IFR probe compartment |
| | 121 | - Electronic rack 1 |
| | 122 | - Electronic rack 2 |
| | 123 | - Electronic rack 4 |

ICN-AE-A-000402-G-S3627-00013-A-01-1

*Fig 2 Example of zoning a fighter air vehicle (Method B)*

2.1.2.3 Method C

Method C is shown in Fig 3. The major areas must be identified as follows:

*Table 8 Major areas (zones) - Method C*

| Major area (zone) (Standard number grouping) | Area |
|---|---|
| 100 | Fuselage |
| 200 | Cockpit |
| 300 | Aft section |
| 400 | Power plants, transmissions and rotors |
| 500 | Left (multipurpose) wing |
| 600 | Right (multipurpose) wing |
| 700 | Landing gear |
| 800 | Specific Mission equipment |
| 900 | Reserved for major differences in models, versions or series of the same air vehicle type not covered by the standard number groupings |

Zones in major areas (eg 200, 300) must be subdivided into zones using the second element digit of the standard number grouping. As an example, Zone 300 can be subdivided as follows:

*Table 9 Major sub-zone*

| Major zone | Major sub-zones | Area |
|---|---|---|
| 300 | | Aft section |
| | 310 | - Empennage structure with vertical wing |
| | 320 | - Rear vertical fin, tail and tail wheel fairing |
| | 330 | - Left horizontal stabilizer with horizontal stabilizer fin |
| | 340 | - Right horizontal stabilizer with horizontal stabilizer fin |
| | 350 | - Upper vertical fin |

The major sub-zones must be subdivided into zones using the third element digit. A possible subdivision of a major sub-zone is given below:

*Table 10 Zone No.*

| Major sub-zone | Zone No. | Area |
|---|---|---|
| 320 | | Rear vertical fin, tail and tail wheel fairing |
| | 321 | - Right vertical fin leading edge |

| Major sub-zone | Zone No. | Area |
|---|---|---|
| | 322 | - Right vertical tail fairing |
| | 323 | - Right vertical tail wheel fairing |

The zoning arrangements must permit definition of a work task or inspection area. The zone identifications can be applied to external inspections to define the limit of area to be inspected.

Example:

- Zone 300 - Inspect external structure (Empennage)
- Zone 320 - Inspect external structure (Right vertical stabilizer and rudder)
- Zone 321 - Inspect external structure (Right vertical stabilizer leading edge)

ICN-AE-A-000402-G-S3627-00014-A-01-1

*Fig 3 Example of zoning a helicopter (Method C)*

## 2.2 Zoning of land systems

The requirements for the zoning of are the same as the general requirements given at Para 2.

### 2.2.1 Example of zoning a land vehicle

2.2.1.1 Major zones

Major zones must be allocated to major physical structures, bulkheads, etc and numbered using the left hand digit of the zone identification number (100, 200, 300, etc) as illustrated in the example at Table 11 and Fig 4 and Fig 5, below:

*Table 11 Major zone identification numbers*

| Major zone | Area |
|---|---|
| 100 | Turret |
| 200 | Elevating mass assembly |
| 300 | Hull aft of fighting compartment bulkhead |
| 400 | Hull fwd of fighting compartment bulkhead |
| 500 | Left track, drive and suspension |
| 600 | Right track, drive and suspension |

ICN-AE-A-030400-A-U8025-00001-A-01-1

*Fig 4 Example of zoning a combat vehicle (major zones) - 1*

ICN-AE-A-030400-A-U8025-00002-A-01-1

*Fig 5 Example of zoning a combat vehicle (major zones) - 2*

2.2.1.2 Sub-zones

Major zone areas (100, 200, 300, etc) must be subdivided into sub-zones using the second digit of the allotted zone number (10, 20, 30, etc) as shown in the example at Table 12 and Fig 6, below.

*Table 12 Sub-zone identification numbers*

| Major zone | Sub-zone | Area |
|---|---|---|
| 100 | | Turret |
| | 110 | Turret front right side, external |
| | 120 | Turret front left side, external |
| | 130 | Turret rear right side, external |
| | 140 | Turret rear left side, external |
| | 150 | Turret front right side, internal |
| | 160 | Turret front left side, internal |
| | 170 | Turret rear right side, internal |
| | 180 | Turret rear left side, internal |

ICN-AE-A-030400-A-U8025-00003-A-01-1

*Fig 6 Example of zoning a combat vehicle (sub-zones)*

2.2.1.3 Zones

Sub-zone areas (10, 20, 30, etc), where necessary, must be further subdivided into zones using the first digit of the allotted zone number (1, 2, 3, etc) as detailed in the example at Table 13 and Fig 7, below.

*Table 13 Zone identification numbers*

| Major zone | Sub-zone | Zone | Zone area |
|---|---|---|---|
| 400 | | | Power pack |
| | 410 | | Power pack compartment |
| | | 411 | Coolant pump bulkhead |
| | | 412 | Starter motor bulkhead |

ICN-AE-A-000304-A-U8025-00004-A-01-1

*Fig 7 Example of zoning a combat vehicle (zones)*

**2.2.2 Example of zoning a ground based facility**

2.2.2.1 Major zones

Major zones must be allocated to major physical structures, buildings, etc and numbered using the left hand digit of the zone identification number (100, 200, 300, etc) as detailed in Table 14 and Fig 8.

*Table 14 Major zone identification number*

| Major zone | Area |
|---|---|
| 100 | Antenna |
| 200 | Transmit subsystem cabin |
| 300 | Receive subsystem cabin |
| 400 | Communications subsystem cabin |

ICN-AE-A-030400-A-U8025-00005-A-01-1

*Fig 8 Example of zoning a satellite communications facility (major zones)*

2.2.2.2 Sub-zones

Major zone areas must be subdivided into sub-zones using the second digit of the allotted zone number as detailed in the example at Table 15 and Fig 9.

*Table 15 Sub-zone identification number*

| Major zone | Sub-zone | Area |
|---|---|---|
| 400 | | Communications subsystem cabin |
| | 410 | Equipment suite 1 |
| | 420 | Equipment suite 2 |

ICN-AE-A-030400-A-U8025-00006-A-02-1

*Fig 9 Example of zoning a satellite communications facility (sub-zones)*

2.2.2.3 Zones

Sub-zone areas, where necessary, must be further subdivided into zones using the first digit of the allotted zone number (1000, 2000, 3000, etc) as shown in Table 16 and Fig 10.

*Table 16 Zone Identification Numbers*

| Sub-zone | Zone No. | Area |
|---|---|---|
| 410 | | |
| | 411 | Equipment suite 1, rack 1 |
| | 412 | Equipment suite 1, rack 2 |
| | 413 | Equipment suite 1, rack 3 |
| | 414 | Equipment suite 1, rack 4 |
| | 415 | Equipment suite 1, rack 5 |

ICN-AE-A-030400-A-U8025-00007-A-01-1

*Fig 10 Example of zoning a satellite communications facility (zones)*

## 2.3 Identification of access points

### 2.3.1 General

Typical access points are: doors, panels, hatches, fillets, fairings, internal floor and ceiling panels, cargo hold linings, etc. If an access point has an identifier on it, this must be used to identify it in data modules.

**Note**

Not all Products have identifiers on the actual access points. If not, they must be assigned a number in data modules.

### 2.3.2 Diagrams and tables

Access identification diagrams must be given in the data modules, which clearly illustrate the position of access points on the Product. Associated tables giving the access point identifier (cross-referenced to the access diagram), and the Product indicate an access point that gives access to (if applicable), can also be a requirement. These tables can be prepared using the descriptive data module type.

### 2.3.3 Access points numbering requirements

Access points must be numbered in association with the Product zoning system.

Letters I and O must not be used in letter suffix or preceding letter coding sequence.

Blow out doors and tank vents are not normally assigned specific access points identifiers.

Access points in the fuselage center line must be coded with left hand designators.

Access points in vertical stabilizer or rudder must be coded from bottom to top.

Access points which are situated in more than one zone must be allocated the zone number of the lowest zone involved.

If a small access point is located in a larger access point, the larger point must be coded first.

An access point on a zone boundary eg a bulkhead must be allocated the zone number of the side of the bulkhead from which the door or panel is removed.

### 2.3.4 Identifying access points for air systems

As already indicated, different access point numbering systems can be applied. The two following methods are given as examples. Method One is typical for a transport air vehicle (Reference Method A for zoning) and Method Two for a fighter air vehicle (Reference Method B for zoning). For a helicopter either Method One or Method Two can be used.

#### 2.3.4.1 Method One

Method is shown in Fig 11. The identifier is built up using the three-digit number of the zone in which the access point is located, followed by a basic two letter suffix and an additional third suffix letter as necessary.

The first of the two suffix letters is the primary identifier and is allocated in a logical sequence, ie inboard to outboard, or forward to aft, beginning with "A" in each zone.

The second suffix letter is the locator, which differentiates the access provision in relation to the zone in the air vehicle, if required.

Example:

- T - Top
- B - Bottom
- L - Left hand
- R - Right hand
- Z - Internal

A third suffix letter can be used to further identify floor, wall or ceiling panels.

Example:

- F and G* Floor panels
- W and X* Wall or side panels
- C and D* Ceiling panels

* When the F, W or C combinations have been used the letters G, X and D will be used to replace them.

Access points located symmetrically on opposite side of the air vehicle must be assigned the same letter designators, even though the zone numbers can be different (eg 521 CB for the left wing, 621CB for the right wing).

Fig 11 shows an example of a code applied to a left hand floor panel located in Zone 215.

ICN-AE-A-000402-G-S3627-00015-A-01-1

*Fig 11 Access code - Method One*

This is panel A in the left side of the floor of Zone 215, upper fuselage.

Table 17 Examples of access codes - Method One shows further examples of access codes using only two suffix letters.

*Table 17 Examples of access codes - Method One*

| Panel No Zone | Suffix | |
|---|---|---|
| 521 | AT | Panel A in Zone 521 Top (of the wing) |
| 521 | CB | Panel C in Zone 521 Bottom (of the wing) |
| 321 | AL | Panel A in Zone 321 Left side (vertical stabilizer) |
| 321 | AZ | Panel Z in Zone 321 Interior (vertical stabilizer) |

Belly Faring - Access Provision on left side
Zones 147, 191, 193, 195, 197

ICN-AE-A-000402-G-S3627-00017-A-01-1

*Fig 12 Example access point location diagram transport air vehicle (Method One) (Sheet 1 of 2)*

Access panels left wing lower trailing edge

ICN-AE-A-000402-G-S3626-00018-A-01-1

*Fig 12 Example access point location diagram transport air vehicle (Method One) (Sheet 2 of 2)*

2.3.4.2 Method Two

Method Two is shown in Fig 13. The identifier is built up using:

- a letter
- a three-digit number
- a second letter

The first letter indicates where the access point is located:

- T - Top (for body and upper surface of the wing)
- B - Bottom (for body and lower surface of the wing)
- L - Left Hand
- R - Right Hand

The three-digit number is the zone identifier in which the access point is located.

The second letter identifies each individual access point in the zone. This letter is allocated in a logical sequence, ie inboard to outboard, or forward to aft, beginning with "A" in each zone.

**Note**

In some cases, the access point (like a panel) can be located in another larger one (a bay door, for instance). In these cases, it is recommended to use letters starting from "S" for these secondary access points.

Fig 13 shows an example of a code applied to a panel located on top of the right hand wing.

ICN-AE-A-000402-G-S3627-00016-A-02-1

*Fig 13 Access code - Method Two*

Table 18 shows further examples of access codes for Method Two.

*Table 18 Examples of access codes - Method Two*

| Panel No. Prefix | Zone | Suffix | |
|---|---|---|---|
| T | 123 | A | Panel A in Zone 123<br>(at the top of the front fuselage) |

| Panel No. Prefix | Zone | Suffix | |
|---|---|---|---|
| T | 123 | B | Panel B in Zone 123<br>(at the top of the front fuselage) |
| B | 422 | B | Panel B in Zone 422<br>(at the bottom of the right hand wing) |
| L | 231 | A | Panel A in Zone 231<br>(left hand in the central part of the fuselage) |
| L | 231 | S | Panel S in Zone 231<br>(left hand in the central part of the fuselage, access located in a major one) |

*Fig 14 Example access point location diagram fighter air vehicle (Method Two)*

## 2.4 Engine zones and identification of engine-mounted airborne equipment and access ports

### 2.4.1 General

The identification of engine zones, engine-mounted airborne equipments and engine access ports must be included in engine and engine-related data modules/technical publications. All appropriate data modules/technical publications must contain specific statements on how engine zones, engine-mounted airborne equipments and access ports can be easily identified. These statements must be included in the data modules/technical publications containing description and operation. Illustrations or tables must be used where necessary to give the locations.

### 2.4.2 Requirements

The main areas of the engine must be indicated by name based on their function eg combustion chamber, low-pressure turbine etc.

Main bearings must be numbered sequentially by location. These numbers can then be used to identify the bearings, their associated housings, seal or other ancillary items.

Location references such as left, right, clockwise, counterclockwise, upper, lower, apply to the engine as viewed from the aft (exhaust) end with the engine in its normally installed position.

Location of engine-mounted equipment/items, interior access ports combustion chambers (turbines), and cylinders (piston engines), must be identified by location and clock position (eg diffuser case, three o'clock).

## 2.5 Identifying access points for land systems

Access points must be numbered in association with the zoning system detailed above. The access point identifier must consist of the three-digit zone number followed by a three-letter access reference (letters I and O must not be used).

### 2.5.1 Access identifier

The access identifier must comprise up to three characters to indicate primary, secondary and minor access points. Each character of the access reference number must be allocated in a logical sequence (eg front to back, left to right, clockwise, etc), beginning with "A" in each zone to identify discrete access points. The first character must indicate main or primary access points/panels. Where a secondary access panel is mounted within a primary access panel, it must be designated using the second character of the access reference number. Minor access points within a secondary access panel must be indicated using the third character of the access identifier. An example of the application of access codes is shown at Fig 15.

ICN-AE-A-000304-A-U8025-00008-A-01-1

*Fig 15 Example of access codes for a combat vehicle*

**2.5.2 Location references**

Location references such as "left", "right", "clockwise", "upper", etc must apply to the system, as viewed from the rear of the platform, in the normal direction of travel. The position of mounted equipment/items, etc must be identified by location and "clock position" (eg crank case, three o'clock).

**2.5.3 Example of access for a ground based facility**

2.5.3.1 Access

For electronic installations and assemblies (eg radio room, computer centre, portable radio, etc), access points must be numbered in association with the zoning system detailed above. The access point identifier must consist of the zone number followed by a three-letter access reference (letters I and O must not be used). For smaller electronic assemblies (eg circuit boards), the access code can be used to provide a location matrix, with the horizontal axis numbered from 1 to 99 as the first two characters of the location code and the vertical axis lettered from A to Z as the third character of the access code.

2.5.3.2 Location reference

Location references such as "left", "right", "clockwise", "upper", etc must be applied as viewed from the front of the system, from an operator's viewpoint. For large fixed systems, location references must use points of the compass (eg South West) and floors (eg Ground Floor). Positioning of mounted equipment/items, etc can be identified by location and "clock position" (eg on/off switch, four o'clock). For location references on circuit boards and diagrams, the representation must be such that the main signal/data flow is from left to right.

## 2.6 Zoning and access for sea systems

**2.6.1 General**

It can be noted that there are significant differences between the zoning and access identification systems to be used on surface vessels and submarines.

The specific method of applying zoning and access to surface ships and submarines must be decided on an individual platform basis, following these general rules.

### 2.6.2 Zoning and access - General

Separate systems for zoning and access allocations must be used for surface ships and submarines.

On surface ships, the term zoning must be associated with the Nuclear, Biological, Chemical Damage (NBCD) control function where areas are defined and equipped during the ship build stage to limit the effects of fire, flooding, contamination or other damage. The aim is to divide the ship into self-contained survival zones.

In submarines, the term zoning must associated with the Damage Control Headquarters (DCHQ) considerations used in the identification of compartments and access points. The aim is to divide the submarine into a number of zones with water-tight boundaries between them.

### 2.6.3 Location markings

In surface ships, a system of location markings based on three-dimensional geographic co-ordinates must be used to identify compartments and access arrangements. For submarines the location markings must be based on the deck, bulkhead and frame numbers, and on the names of the compartments.

## 2.7 Zoning and access - Surface vessels

### 2.7.1 Zoning

Zoning is employed to help avoid the loss of an important system capability through the effects of fire, flooding, the spread of toxic gases or damage caused by a consequence of an attack resulting in the spread of primary and secondary weapon effects.

Zoning is achieved by selecting main transverse bulkheads which continue up beyond the weather-deck/forecastle/flight deck to the uppermost decks in the superstructure. These bulkheads must be designated zone boundaries and are coincident with the main watertight bulkheads (which reach up to No 1 deck) and continue up through the superstructure as fire bulkheads.

In consideration of zoning for NBCD purposes, zones must be sufficiently self-contained to operate for continuous periods of up to 12 hours with the zone boundaries closed down. For this, each zone is normally provided with autonomous systems for the following:

- Electrical power generation (with fuel supply)
- Electrical power distribution
- Chilled water and weapon cooling systems
- Fire pumps and firefighting arrangements
- Flood and firefighting water removal and draining
- Internal communications
- Machinery and damage surveillance and control
- Smoke containment and removal
- Ventilation, air conditioning and a chilled water distribution system
- Collective NBCD protection and air filtration
- Emergency support for the crew
- Compressed air distribution

The number, autonomy, size and arrangement of zones in any ship, depends on operational, technical and financial considerations. At the design phase, the operational value of the greater degree of protection provided by a larger number of zones is balanced against the cost of the additional subdivision required to support them. The requirement for personnel and environment support systems to cross zone boundaries is also a factor in deciding how zoning must be arranged.

**2.7.2 Access points**

Access points on the hull of a vessel are, by their nature, limited and therefore do not need specific identification. Within the compartments of a vessel, equipment is not generally hidden behind panels and thus locations must be identified by their relation to appropriate Frame / Frames within a compartment.

**2.7.3 Location markings**

Location markings must be used to uniquely identify all watertight compartments, trunks, doors and hatches and other fittings which can affect the watertight or gastight integrity of the ship. The marking system must include the non-watertight compartments that are important or are in frequent use.

Location markings must provide a means of indicating any position rapidly and without ambiguity. They must provide a system whereby the position of any incident, such as fire or damage, can be accurately identified. The system shown in Fig 16 thru Fig 19 is logical and can be applied to any ship regardless of size and complexity of subdivision.

2.7.3.1 Deck numbering

The subdivision of a surface vessel must be achieved by the use of decks to divide the ship horizontally from the weather-deck/forecastle/flight deck (No. 1 deck) to the inner bottom and the superstructure. Main transverse bulkheads are used to divide the vessel lengthways into main sections. A main transverse bulkhead is defined as a bulkhead that is continuous from the keel to the underside of the weather-deck/forecastle/flight deck.

Decks must be numbered consecutively downwards to the outer bottom starting with the weather-deck/forecastle/flight deck as No. 1 deck. Decks above the weather-deck/forecastle/flight deck must be numbered commencing with No. 01, 02 and so on consecutively upwards.

2.7.3.2 Ship sections

Main sections formed by transverse watertight bulkheads must be identified by characters from the phonetic alphabet starting with A, B, C, etc from forward to aft.

**Note**

To avoid confusion, I and O are not to be used.

Watertight compartments formed by transverse bulkheads within these main section compartments, must be given suffixes starting A, B, C, etc from forward, or Z, Y, X, etc from aft, as well as the marking of the main section.

2.7.3.3 Longitudinal bulkheads

Where longitudinal bulkheads divide a main section compartment, positions relative to the centre line of the vessel must be identified using a numbering system from the centre line outwards, with even numbers (2, 4, 6, etc) to port and odd numbers (1, 3, 5, etc) to starboard. Access points must also be identified in a manner which complements the location system.

2.7.3.4 Doors and hatches

Doors must generally bear the marking of the compartment to which they give access. Hatches must bear the numbers of the decks in which they are cut, followed by the horizontal co-ordinates of the compartments to which they give access eg Hatch 5DY is in deck No. 5 and gives access to compartment 6DY. Where two or more doors or hatches (cut in the same deck) give access to the same compartment they must be distinguished with the words PORT (or STARBOARD) and/or FORWARD (or AFT) in abbreviated form after the marking. As an example, hatch “5DY Stbd” is the starboard hatch of a pair giving access to compartment 6DY.

**2.7.4 Coding of equipment items**

Location coding of equipment items inside compartments must follow the practices described at Para 2.7.3.

ICN-AE-A-000304-A-U8025-00009-A-01-1

*Fig 16 Surface ships - Decks and main sections*

*Fig 18 Surface ships - Compartments with trunk*

ICN-AE-A-000304-A-U8025-00012-A-01-1

*Fig 19 Surface ships - Doors and hatches*

2.7.4.1 Zoning and access marking examples

The following give examples of the rules and practices to be followed in marking the various types of zoning and access markings.

*2.7.4.1.1 Compartment markings*

Fig 17 and Fig 18 show typical identifications for various ships compartments. The specific rules to be followed are given below.

- Compartment location marking positions: These must be placed to be visible from all entrances. If this is not possible with a single mark, the marking must be repeated to enable identification from all entrances. The markings must be made up in accordance with the following rules.
- First character (Number): Deck number. Decks must be numbered 1, 2, 3, etc downwards from No 1 deck (forecastle, weather-deck or flight deck), and 01, 02, 03 decks above No. 1 deck.
- Second character (Letter): Section. Sections are the overall lengths between the main transverse bulkheads. They must be lettered A, B, C, etc. from forward to aft. (I and O are not to be used).
- Third character (Letter): Compartment, fwd/aft position. Compartments are the enclosed divisions within sections. They must be lettered A, B, C, etc from the forward end of the section, or Z, Y, X, etc. from the aft end of the section. The size of the lettering must be reduced from the first two characters.
- Fourth character (Number): Compartment, athwart-ships position. Position of compartment from centerline. They must be numbered 1, 3, 5, etc to starboard and 2, 4, 6, etc to port. A compartment on the centerline must be numbered 0.
- Suffix (Numbers): Internal watertight compartments. Suffix -00 used for a single compartment. Suffixes -100, -200, etc for two or more contained compartments. Odd numbers to starboard, even numbers to port.

Marking examples: 2BA3 indicates a compartment on No 2 deck at the forward end of B section. It is the second compartment to starboard of the centerline. An internal watertight

compartment inside the main compartment must be marked as 2BA3-00. Two internal compartments must be marked 2BA3-100 and 2BA3-200.

*2.7.4.1.2 Door markings*

Fig 19 shows the marking methods that must be used on doors. The specific rules that must be followed are given below.

- Door marking position: Both sides, upper corner or hinged edge.
- Door marking rules: Doors must bear the marking of the compartment to which they give access. If a compartment has two doors, they must be marked PORT, STBD or FWD, AFT as appropriate.
- Doors in main transverse bulkheads separating lettered sections: These must have the deck number and both section letters in alphabetical order.

Marking examples: Marking 2PB indicates a door giving access to compartment 2PB. Marking 2D/E indicates a door connecting D and E sections on No. 2 deck.

*2.7.4.1.3 Hatch markings*

Fig 19 shows the marking methods that must be used on hatches. The specific rules that must be followed are given below.

- Hatch marking position: Near corner on hinged side.
- First character(s) (Number): Deck in which hatch is cut.
- Remaining characters (letters and numbers): to give fore/aft and athwart-ships position of compartment to which the hatch gives access. The section letter must be the same size as the deck number. The remaining characters must be of reduced size.
- Where two hatches give access to the same compartment, the markings must be qualified by PORT/STBD or FWD/AFT.

Marking example: Marking 2DA1 indicates a hatch on No. 2 deck giving access to a No. 3 deck compartment in fore/aft section D and compartment co-ordinates A1.

*2.7.4.1.4 Fixed manholes*

The marking must show the compartment to which a manhole gives access. Manholes in hatches must not be marked and must be referred to as Manhole in Hatch 6GZ4.

Marking example: Marking 6GZ4 indicates a manhole giving access to compartment 6GZ4.

*2.7.4.1.5 Trunks*

Trunks must be marked on each separate section of the trunk.

The trunk must carry the deck number of the top hatch or door, plus the marking of the compartment at the bottom of the trunk.

Each hatch in a trunk and each intermediate door must have its own deck number, plus the marking of the compartment at the bottom of the trunk. The word TRUNK must be marked on all hatches and doors giving access to the trunk.

Marking example: Marking 1/5DA indicates a trunk running from No. 1 deck thru No. 5 deck, compartment 5DA.

*2.7.4.1.6 Frame station numbers*

Frame stations must be numbered at main transverse bulkheads and also must be marked as needed in conspicuous positions on bulkheads.

Marking example: 17 indicates a main transverse bulkhead at the seventeenth frame section from the foremost frame.

*2.7.4.1.7 Other side markings*

Must be marked on bulkheads forming perimeter of dangerous compartments eg magazines, machinery spaces and flammable stores. Also, in multiple section ships, these must be marked on the main bulkheads below the lowest communications deck.

Marking example: MAGAZINE OS indicates a bulkhead surrounding a compartment containing a magazine.

*2.7.4.1.8 Compartments below*

Must be marked as needed above hatchways to indicate compartments gained thereby. Instead of the marking COMPARTMENTS BELOW, an arrow can be used if desired.

Marking example: COMPARTMENTS BELOW.

*2.7.4.1.9 Temperature monitoring marks*

Marking must be applied to external boundaries of high-risk (fire, explosion, etc) compartments.

## 2.8 Zoning and access - Submarines

### 2.8.1 Zoning

Submarines must be subdivided into a number of zones with water-tight boundaries between them. The following rules must be applied:

- Smoke-tight boundaries must be positioned between each high fire risk area and each high value compartment eg operations rooms, computer rooms, navigational equipment compartments, etc.
- Decks must be continuous to smoke-tight boundaries.
- Where smoke-tight boundaries cross passageways, smoke curtains must be fitted.
- Where a hatch or main watertight door forms part of a smoke-tight boundary, a smoke curtain must be fitted to allow a fire to be fought with an open door/hatch.

### 2.8.2 Access

Access points on the hull of a submarine are by their nature limited and therefore do not need specific identification. Within the compartments of a submarine, equipment is not generally hidden behind panels and thus locations must be identified by their relation to appropriate frame numbers within a compartment.

### 2.8.3 Location markings

The identification of locations in submarines is necessarily different to that of surface vessels, mainly due to their design and size. The training programs for submarine crews differ from surface ship practice to accommodate this. Submarines do not have the NBCD requirements that apply to surface vessels, and zoning must be determined around the DCHQ practices. Also, stability considerations mean that submarines do not have watertight longitudinal divisions.

The system of determining and identifying compartment and access point locations in submarines must be defined by the deck, bulkhead, frame-numbers, and whether the location is to port or starboard of, or on the centerline of the submarine.

Physical markings other than for bulkheads and frames must not be made within submarines. A location defined from bulkheads and frames must guide personnel to close proximity of a specified location. To support this, submarine training requires that crews have a degree of familiarity with the layout of a submarine in order that they are able to determine their position from their surroundings and are able to identify which compartments surround their present position.

### 2.8.4 Coding for inside compartments

Location coding inside compartments must follow the practices described in Para 2.7.3 for equipment items.

ICN-AE-A-000304-A-U8025-00013-A-01-1

*Fig 20 Submarines - Zoning and access*

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use of zoning and access**. The project or the organization must decide whether to use the zoning rules or not. Refer to Para 2.

**Methods for zoning air systems**. The project or the organization must decide which method of zoning to use. Refer to Para 2.1.

**General identification of access points**. The project or the organization must determine the identification system for those access points that do not have identifiers. Refer to Para 2.3.

**Identifying access points for air systems**. The project or the organization must decide which method of identification to use. Refer to Para 2.3.4.

**Methods for zoning and access for surface ships and submarines systems**. The project or the organization must decide which method of zoning and access to use. Refer to Para 2.6.

## List of tables

1 References ..... 1

## *References*

*Table 1 References*

| Chap No./Document No. | Title |
|---|---|
| Chap 3.7 | Information generation - Quality assurance |
| Chap 3.9.5.1 | Data modules - Identification and status section |
| Chap 3.9.5.2.1.1 | Common constructs - Change marking |
| Chap 4.7 | Information management - Version control of data modules |
| Chap 4.13.2 | Optimizing and reuse - Technical information repository data module |

## 1 General

There are rules governing the information required to update and release data modules. Different methods are used to indicate the different types of update. Apart from new data modules, there are five different types of update:

- status
- changed

- revised
- deleted
- reinstated, of which there are three types:
  - status
  - changed
  - revised

**Note:**

The rules in this chapter also apply to publication modules and SCORM content package modules.

# 2 Updating data modules

## 2.1 Frequency of update

The frequency of updating will be decided by the project or organization.

Data modules can be updated to include eg:

- material not available at the initial issue of the data modules
- use of new materiel
- use of new consumables
- new information gained through operational experience
- changes resulting from technical publications improvement reports
- changes to software
- modifications/alterations, Service Bulletins, special technical instructions and similar documents
- changes as a result of QA checks
- changes as a result of the electronic review function
- other data needing to be added or revised

For a detailed explanation of how the use of technical information repository data modules affect the update process of data modules. Refer to Chap 4.13.2.

## 2.2 Use of change marks and highlights

Data modules that are of type "changed" (refer to Para 2.5) or "reinstated and changed" (refer to Para 2.8) have changes marked with change mark elements and attributes. The precise rules for applying these elements and attributes are given in Chap 3.9.5.2.1.1.

Changes that change the content of elements use the change markup within those elements. Refer to Chap 3.9.5.2.1.1.

For the detailed descriptions of and rules for the use of the elements and attributes that indicate changes. Refer to Chap 3.9.5.2.1.1.

The reasons for any changes to a data module are summarized and recorded in the identification and status section. This text is used for creation of the front matter data module called Highlights.

## 2.3 Use of issue and inwork numbers

### 2.3.1 Issue numbers

For every release of a data module, the issue number must be incremented by one. For a detailed description of the elements and attributes for issue information, refer to Chap 3.9.5.2.1.1. For rules for their use, refer to Chap 3.9.5.1 and Chap 4.7.

### 2.3.2 Inwork numbers

The ability to track drafting of changed information during the information generation process is facilitated by the use of an inwork number. The process of drafting is indicated by incrementing

the inwork number. For a detailed description of the elements and attributes for issue information, refer to Chap 3.9.5.2.1.1. For rules for their use, refer to Chap 3.9.5.1 and Chap 4.7.

## 2.4 New data modules

New data modules must have their issue information set as described in Chap 3.9.5.1.

## 2.5 Change of a data module

A change is that form of updating a data module which affects only parts of an existing data module. A change can affect the content section or can be required solely to update an element or attribute in the identification and status section, eg the applicability or to give the new QA status. For a detailed description of the elements and attributes of issue information and their use for indicating a change in the content and/or identification and status section, refer to Chap 3.9.5.2.1.1. For rules for their use, refer to Chap 3.9.5.1 and Chap 4.7.

## 2.6 Issue of a revised data module

A revised data module is one which has been completely reworked. For a detailed description of the elements and attributes of issue information and their use for indicating a revision of a data module, refer to Chap 3.9.5.2.1.1. For rules for their use, refer to Chap 3.9.5.1 and Chap 4.7.

## 2.7 Deletion of a data module

A deletion of a data module may be necessary, eg whenever a described configuration no longer exists. In such case the data module is retained in the CSDB and marked as deleted, rather than physically being deleted. For a detailed description of the elements and attributes of issue information and their use for indicating a deletion of a data module, refer to Chap 3.9.5.2.1.1. For rules for their use, refer to Chap 3.9.5.1 and Chap 4.7.

## 2.8 Reinstating a data module

Reinstating a data module is the action of restoring a deleted data module and making it available for use. If a data module is reinstated, the issue number at the time of deletion must be incremented by one at the time of release. For a detailed description of the elements and attributes of issue information and their use for indicating a reinstated data module, refer to Chap 3.9.5.2.1.1. For rules for their use, refer to Chap 3.9.5.1 and Chap 4.7.

## 2.9 Release of updated data modules

The release of all data modules is the process of declaring it fit for distribution to, and use by, a partner company and/or the customer. The QA process for this declaration is explained in Chap 3.7. For a detailed description of the settings for the elements and attributes of issue information, refer to Chap 3.9.5.2.1.1, Chap 3.9.5.1 and Chap 4.7.

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Frequency of updates**. The project or the organization must decide on the frequency of updates. Refer to Para 2.1.

**Indicating the deletion of an element for display**. The project or the organization must decide whether to indicate, in display, that an element has been deleted or not. Refer to Para 2.7.

# Chapter 3.6

| Chap No./Document No. | Title |
|---|---|
| Chap 3.5 | Information generation - Updating data modules |
| Chap 6 | Information presentation/use |
| C-M(2002)49 | NATO Security Policy |

# 1 General

Data modules include four types of information relating to security. These are classification, caveats, instructions and information.

# 2 Security and data restrictions

## 2.1 Security

### 2.1.1 Security classification

Classifications include restrictive and commercial markings. A classification is a category, class or grade assigned to defense information or material, in relation to the degree of danger to security that would result from its unauthorized disclosure, excluding restrictive markings.

2.1.1.1 International defense organization classifications

International defense organizations can have their own definitions for security classifications. The security classifications for the North Atlantic Treaty Organization (NATO) are defined in Security Policy (C-M(2002)49).

2.1.1.2 National classifications

National classifications will be specified by the policy for each nation. Projects or organizations must determine how security classifications will be used and marked within their project.

### 2.1.2 National caveats

A national caveat is a restrictive marking (eg UK/US EYES ONLY) or security code word that is applied to complement an appropriate security classification which is normally not lower than confidential.

Data modules/technical publications which require national caveats are permitted. The national caveat is normally used to restrict the data modules/technical publications to named persons or authorized nominees.

### 2.1.3 Commercial security classification

A commercial security classification is a category or grade, such as "Commercial In Confidence", assigned to company or government department information or material to indicate the degree of danger to the company or government department security that would result from its unauthorized disclosure. It also an indication of the standard of protection required to guard against unauthorized disclosure, excluding restrictive markings. A commercial security classification is normally used by a company to protect information or material relating to government contracts which have not been awarded.

Whilst these classifications would not normally be used for data modules/technical publications there can be occasions where, at the start of a project, data modules are produced and given commercial security classifications before a NATO/national security classification has been allocated by the project or organization. The originator of the data module should take advice from either the project or organization security instructions or the company security controller on the use of the particular commercial security classification and the precautions to be taken with the information and material. As soon as a government contract has been agreed, the NATO or national security classification becomes effective.

The retention of this classification within a data module, throughout its life is to be determined by the project or organization.

### 2.1.4 Restrictive markings

Restrictive markings are additions to the security classification of data modules/technical publications. The restrictive markings that are available for data modules are national caveats (including international defense organization markings), commercial markings and export controls, distribution, handling and destruction. The markings are used to indicate that the handling and distribution of the data module/technical publication is restricted to those

categories of persons authorized to have access to the information contained therein. The security markings on data modules/technical publications are always a combination of the security classification and any restrictive marking.

Security code words must be defined within the project.

## 2.2 Instructions

This information type gives specific instructions relating to the data module.

### 2.2.1 Distribution

The distribution requirements, including export control notices, which apply to a data module, dependant on its security classification and user rights must be recorded within the data module. The distribution is recorded and approval for copying and must be obtained from either the originator or the company security controller.

### 2.2.2 Export control

The project or organization security instructions will normally give the instructions for the control of export of data modules. Where appropriate, these are recorded in the data module. If there are no project security instructions, the company security controller should be contacted for advice.

### 2.2.3 Handling

The project or organization security instructions will normally give the instructions for handling, including storage, of classified data modules/technical publications. If there are no project security instructions, the company security controller should be contacted for advice.

### 2.2.4 Destruction

The project or organization security instructions will normally give instructions on how to destroy classified data modules/technical publications when they are no longer required. If there are no project security instructions, the company security controller should be contacted for advice. Paper classified data modules/technical publications (including drafts, spoilt work etc) are normally destroyed by either shredding or burning. Unwanted copies of classified data modules/technical publications must be given the appropriate security protection until they are destroyed; once they are destroyed, certificates are signed and retained.

### 2.2.5 Use or disclosure

The project or organization security instructions will normally give the instructions for the intended use or disclosure of the data module.

### 2.2.6 Supersedure

The project or organization security instructions will normally give the instructions for notices that the data module or publication supersedes other data modules or publications.

## 2.3 Information

This information includes copyright, policy reference and conditions that can apply to a data module.

### 2.3.1 Copyright

A marking that is used to give copyright information like the copyright mark [©] followed by the year, or years, and the copyright holder.

### 2.3.2 Policy reference

This is a reference to the appropriate security policy documentation.

#### 2.3.3 Conditions

These are any specific conditions that can apply such as changing security classifications as a result of aggregation of data.

## 2.4 Classifying data modules/technical publications

It is the responsibility of the originator to classify the data module/technical publication according to the total content, ie classified according to the highest classified information or material they contain. For example, a data module/technical publication containing information or material classified between restricted and secret must be classified as secret.

Normally the originator of the data module/technical publication would classify data module/technical publications according to the security classification of the source data used in their production. If the originator is in doubt as to the correct security classification, advice should be sought from either the project or organization security instructions or the company security controller. Some projects can stipulate a maximum security classification for the data modules/technical publications. It is the responsibility of the originator to make sure that this maximum security requirement is not exceeded.

## 2.5 Changes in security classification

Although data modules/technical publications would have been given a correct security classification when originated, they can require changes for a number of reasons:

- The result of a security review their security classification can be downgraded.
- The result of adding new classified information, data modules/technical publications can require their security classification upgraded.
- The classification of data modules can also be affected by the aggregation of data modules into a CSDB.

It is the responsibility of the originator of the data module/technical publication to upgrade or downgrade data module/technical publications according to their new content. Advice can be taken from either the project or organization security instructions or the company security controller. When changing the security classification of data modules/technical publications, the originator must always take into account the maximum security requirement for the project or organization (see Para 2.1.4 and Para 2.2). Changes to the security classification of data modules are considered a status change to the data module and is to be recorded within the data module in accordance with Chap 3.5.

## 2.6 Presentation

Refer to Chap 6 for the presentation of security markings for data modules and their presentation in technical publications.

## 2.7 Control

The project or organization security instructions will normally give the instructions for the control of classified data modules/technical publications. If there are no project security instructions, the company security controller should be contacted for advice. Examples of the control of classified data modules/technical publications are:

- Classified data modules/technical publications should be seen only by authorized persons who have a need to see them. Control of classified data modules/technical publications helps to:
  - reduce the risk of breaches of security, either by deliberate action or carelessness
  - assist in investigations into breaches of security
  - reinforce the "need to know" principle
- All classified data modules/technical publications should be accountable; a system should be adopted which makes sure that all classified data modules/technical publications do not go astray and that a designated person is responsible for their inception or receipt until their destruction.

– At set periodicities, spot/total checks of classified data modules/technical publications should be carried out.

## 2.8 Common source database

The classification of data modules when aggregated into a CSDB would normally be as high as the highest security classified data module. However, there are occasions where the aggregation of data modules requires that the security classification is, in fact, higher than the highest classification. Projects should refer to project security instructions on this matter. If there are no project security instructions the company security controller should be consulted.

## 2.9 Emergency planning

It is recommended that plans be developed for the protection, removal, or destruction of classified material in case of fire, natural disaster, civil disturbance, terrorist activities, or enemy action, to minimize the risk of its compromise. The level of detail and amount of testing and rehearsal of these plans should be determined by an assessment of the risk of hostile action, natural disaster, or terrorist activity that might place the information in jeopardy.

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Definitions of security terms**. The project or organization must decide on the definitions of security terms. Refer to Para 2.1.1.

**Application of caveats**. Projects must determine if the policies that apply to security marking, instructions, etc. and how those markings are required to be applied within their project. Refer to Para 2.1.2.

**Retention of classifications**. The project or organization must decide on the retention of security classifications. Refer to Para 2.1.3.

**Use and marking of security classifications**. The project or organization must decide on how the security classifications will be used and indicated. Refer to Para 2.1.4.

| Chap No./Document No. | Title |
|---|---|
| Chap 3.9.5.1 | Data modules - Identification and status section |
| Chap 4.6 | Information management - Comment |

# 1 General

The QA of data modules/technical publications is the collection of checking activities that are carried out to ensure that the contents are fit for purpose and technically accurate. These checking activities can vary, especially for aerospace systems between civil and military programs.

# 2 Quality assurance

## 2.1 Quality Assurance application

### 2.1.1 Quality assurance for air programs

Military air QA differs from the civil air QA in that each of the military customers can set its own requirements which have to be complied with by the contractor/industry. Civil customers and civil aviation airworthiness authorities' requirements are, that the manufacturer's organization leads to the required quality of data modules/technical publications which must comply with acceptable rules such as those detailed in the ATA series of specifications.

In military projects, fitness for use checking is carried out by the contractor (first verification) and optionally by the customer (second verification) whereas in civil projects, this checking is the responsibility of the contractor.

### 2.1.2 Quality assurance for land and sea systems

The QA requirements for both military and civil programs in land and sea applications are defined by the customer. Therefore, the degree of the application of QA detailed in this chapter is to be decided by the project or organization.

### 2.1.3 In-process review - Military

An In-Process Review (IPR) is an optional review by the customer of data modules/technical publications that are being produced by the contractor for the Product. The main function of the in process review is for the customer to give guidance to the contractor. Normally in process review activities are initiated by the customer but they can also be requested by the contractor when assistance or clarification is required. The in process review ensures that the data modules/technical publications are being prepared to the required scope, depth and timescale in accordance with the contract and the applicable specifications.

### 2.1.4 First QA review - Civil

First QA review is the process by which the contractor's QA organization verifies that the produced output adequately and accurately complies with the requirements set by the rules of the project or organization and the applicable specifications.

### 2.1.5 First verification - Civil and military

First verification (sometimes known as validation) is the process by which the contractor validates that the data modules/technical publications are:

- the correct data modules/technical publications
- fit for purpose
- adequately describe the Product
- technically accurate
- safe to use by the customer

First verification is certified by the contractor for all military programs. For civil aerospace programs, the first verification must satisfy the civil aviation airworthiness authority of the contractor.

### 2.1.6 Second verification - Military

Second verification is the optional process by which the customer carries out a practical demonstration of the data modules/technical publications, supplied by the contractor, to make

sure that the technical information is adequate to permit the efficient and safe use of the Product. Responsibility for the technical accuracy of the information remains with the contractor.

## 2.2 The quality assurance process

To ensure that the data modules/technical publications are produced in accordance with the customer's requirements, the contractor must include in his production procedures the appropriate control of quality. The assurance of quality must be substantiated by evidence that the quality control is maintained and that "in-house" checks and first verification have been carried out. As part of this QA, the customer can review the contractor's quality control, including the "in-house" checks and first verification, to ensure that the required quality is achieved by the contractor.

### 2.2.1 Quality assurance program

The contractor must produce and maintain a documented QA program for the technical information that is contracted for. The program must be reviewed as necessary to ensure that it remains effective and describes, in sufficient detail, the procedures that ensure that the data modules/technical publications that are being produced are technical accurate, safe to use and meet the requirements in terms of scope, depth and timescales.

The QA program should take into account such areas as:

- development, preparation, maintenance and distribution of procedures for the preparation, "in-house" checks and first verification of the data modules/technical publications
- co-ordination with design, production, product support and other such departments to ensure that the source data used to produce the data modules/technical publications is to the required standard
- the establishment and maintenance of a system for identifying the QA status and technical standard of the technical data being prepared for the data modules/technical publications during all preparation stages
- the establishment of first verification procedures and "in-house" checks to determine the adequacy and accuracy of the data modules/technical publications during the development stages
- formal in process review (military) or first QA reviews (civil) to make sure that the data modules/technical publications are adequate and comply with the specifications for both content and production
- first verification of the data modules/technical publications. Refer to Para 2.1.5.
- commenting, recording and reporting on issues raised during the production process and the in-service phase of the Product. This can be achieved by using the commenting process explained in Chap 4.6.
- establishing the correct security classification for data modules in accordance with the project or organization security guidelines
- a detailed schedule that shows the timing and sequence of the various stages throughout the production and in-service phases. An outline example of such a schedule, for a project or an organization, is shown at Fig 1, where the dotted line boxes indicate supplier activity and the solid line boxes indicate customer activity. In this example, the in process review activity takes place after the first verification and the second verification takes place during the in process review. Alternatively, the second verification activity could take place during first verification or after the in process review.

ICN-AE-A-000307-A-U8025-00014-A-01-1

*Fig 1 Outline schedule example*

**2.2.2 Implementation of the quality assurance program**

The contractor must prepare a schedule which will permit the customer or the appropriate release authority to carry out in process review (military) or QA checks (civil) of the data modules/technical publications. In process review (military) or QA checks (civil) can also be requested by the contractor when assistance or clarification is required.

Data modules/technical publications produced for military programs by the contractor can be subject to second verification, either at the contractor's premises or the customer's premises. Second verification by the customer does not absolve the contractor from carrying out first verification and must not be used by the contractor as evidence of effective QA if done at the contractor's premises.

Data modules/technical publications can require second verification at the contractor's premises so as to prove practical applicability to the satisfaction of the appropriate release authority or the customer.

In certain cases, first and second verification can be combined into one process of technical verification, and can be applied to all data modules/technical publications, upon agreement between the contractor and the customer in these processes.

**2.2.3 Methods of first verification**

The method of first verification of draft data modules/technical publications depends on the type of technical information they contain. Some drafts can be checked against items of design documentation such as drawings, test schedules etc. This is known as "Table top" first verification. Other drafts, such as those containing procedural steps, can require a practical demonstration of the procedure. This is known as "On object" first verification. Other drafts can require that both types of first verification are carried out.

The contractor must use his engineering judgment in deciding which first verification method is to be used. The technical need for the type of first verification can have to be weighed against economic considerations in respect of time, safety and other prevailing factors but in all cases, is to be carried out.

The contractor in military programs must submit his first verification proposals to the customer for agreement.

### 2.2.4 Practical demonstration of first verification

A practical demonstration of first verification of a procedure must be carried out in sequence and under conditions that provide reasonable assurance of the suitability of the procedure under normal customer conditions. Use must be made of the appropriate approved tools/test equipment, if available.

The customer must be informed of any situations where a contractor in military programs is not able to carry out first verification because of the lack of facilities. This could occur, for example, when separately developed Product and test equipment come together for the first time after the Product has been delivered to the customer. In these cases, the first verification must be carried out as soon as possible.

For civil programs, data modules/technical publications containing procedural information for airborne equipments must be shop first verified. Should this not be possible before the issue of the data modules/technical publications to the customer, it is permissible to carry out the first verification by simulation. All procedures that have been first verified by simulation, however, must have a practical demonstration at the earliest possible time.

### 2.2.5 Methods of second verification

The methods of second verification that can be used are table top, on object or both, in the same way as first verification. The application of these methods must be determined by the project or organization.

## 2.3 Indicating QA in data modules

As data modules progress through the production phase to the in-service phase their QA status is recorded. Whilst in production, the elements of QA are populated to indicate that a data module is:

- unverified which indicates that the data module is effectively in draft
- first verified with the type being set to one of:
  - table top
  - on object
  - table top and on object
- second verified with the type being set to one of:
  - table top
  - on object
  - table top and on object

When a data module is changed and, therefore requires re-verification, the QA status is set back to unverified.

Data modules that are changed between releases must have those changes tracked using the elements and attributes for issue information.

For a detailed explanation of the rules for the population of these elements and their attributes, see Chap 3.9.5.1.

## 2.4 Review cycle examples

The nature of modern complex projects means that they also often have complex contractual arrangements. The examples given at Para 2.4.1 and Para 2.4.2, are intended as examples only and that project or an organization must establish and detail their own processes and procedures.

### 2.4.1 Simple example

In the case of the simple project that has one supplier, one customer and one Product, the review cycle is relatively simple as shown in Fig 2.

### 2.4.2 Complex example

In more complex contractual arrangements, a consortium of companies could be responsible for the whole project. The example shown in Fig 3 contains less detail than that of Fig 2 as there are three partner companies who are each a design authority for a contributing part of the Product and one of them has the lead function for technical publications. In this example, this lead company has decided to outsource the production of data modules.

As lead technical publications function, PC1 has the responsibility to the project for the QA aspects of all data modules that are produced in support of all three contributing companies. Therefore, it is PC1 who must ensure that all three contributing companies become involved in validating that the correct data modules have been produced and that those that have been produced are technically accurate and safe to use.

ICN-AE-A-000307-A-U8025-00015-A-01-1

*Fig 2 Simple QA review cycle example*

ICN-AE-A-000307-A-U8025-00016-A-01-1

*Fig 3 Complex QA review cycle example*

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Degree of the application of QA**. For both military and civil projects, the project or organization must decide the degree of the application of QA. Refer to Para 2.1.2.

**Decide on which type of first verification to use**. The project or organization must decide which if the types of first verification must be applied to data modules/technical publications. Refer to Para 2.2.3.

**Decide whether first verification rules apply**. The project or organization must decide whether a set of rules apply. For example, such a rule might be that all data modules that have a safety related procedure must have first verification carried out "On object". Refer to Para 2.2.3.

**Application of second verification**. The project or organization must decide on the rules for the application of second verification. For example, such a rule might be that have a safety related procedure must have second verification carried out "On object" and at the same time as first verification. Refer to Para 2.2.5.

**Decide on the appropriate review cycle process**. The project or organization must decide on the most appropriate review cycle processes and procedures. Refer to Para 2.4.

## *References*

*Table 1 References*

| Chap No./Document No. | Title |
|---|---|
| None | |

# 1 General

The disassembly principles have a basic principle supported by three rules.

# 2 Disassembly principles

## 2.1 Basic principle

The disassembling principle is based on the consecutive numbering of assemblies obtained during equipment disassembly and subsequent maintenance activities. The assemblies numbered are subsequently allocated their own set of data modules. The allocation of "00" is reserved for the complete equipment followed by sequential numbering in accordance with this chapter.

**Note**

The numbering sequence is not necessarily inline with any step by step maintenance task.

## 2.2 Rules for numbering assemblies

Assemblies need to be numbered, using the disassembly code, only if one or more of the following three conditions apply:

### 2.2.1 Rule No. 1

The first condition for numbering an assembly, using the disassembly code, is the performance of further maintenance actions on that assembly. If there are no maintenance actions performed on an assembly, that assembly will not be allocated a number or a set of data modules.

### 2.2.2 Rule No. 2

The second condition for the allocation of a number, using the disassembly code, is the complexity of an assembly. Simple assemblies may not need data modules. This is to prevent unnecessary breakdown of maintenance information.

### 2.2.3 Rule No. 3

In addition and to prevent unnecessary breakdown, a number is allocated, using the disassembly code, only in such cases where the volume of maintenance information relating to maintenance actions to be taken is sufficient to warrant an individual data module to be prepared.

## 2.3 Assemblies and parts

As a rule disassembly generates parts, which happens when an assembly is disassembled. Since maintenance actions might sometimes be applicable to parts as well as assemblies, the following rule applies:

If maintenance actions on parts need to be performed, the information must be included in the data module of the assembly to which the parts belong, unless the issue of separate data modules is justified. The same applies to those assemblies which are not allocated an individual number in accordance with rules No. 2 and 3, above, despite maintenance actions being required.

## 2.4 Symbolic explanation

### 2.4.1 Simple example

A simple symbolic example is shown in Fig 1. Based on the complete equipment, the process of disassembly into assemblies and parts is described. The following assemblies/parts are obtained during disassembly of the complete equipment (ie the subject being disassembled (disassembly code = "00")):

- three assemblies, which are subject to further maintenance actions
- six assemblies/parts, which do not require maintenance

In this case, all of the three assemblies, which are subject to further maintenance actions, will be numbered in accordance with the three rules given in Para 2.2. The disassembly code for these will be allocated the numeric characters "01", "02" and "03" and will thus be provided with a separate set of data modules each; the sets will be marked with the subjects of disassembly: "01", "02" or "03". Under the maintenance actions, these three subjects of disassembly will be further disassembled into assemblies/parts that do not require further maintenance actions.

ICN-AE-A-004003-G-S3627-00024-A-01-1

*Fig 1 Disassembling principle - Simple example*

### 2.4.2 Complex example

A complex symbolic example is shown in Fig 2. Based on the complete equipment (ie the subject being disassembled (disassembly code = "00")) all pipes, hoses and cables will be removed during the first step of disassembly. In this case, they are not subject to further maintenance actions.

The equipment, less the pipes, hoses and cables (which have previously been removed) is subject to further maintenance actions and, therefore, the disassembly code is allocated the numeric characters "01". In accordance with the maintenance activity (as described in the set of data modules) another step of disassembly is undertaken; removal of accessories. The removal of the three accessories will generate four assemblies in total, all of which are subject to further maintenance actions and, therefore, have their disassembly codes allocated a number. The accessories will have their disassembly codes set to "02", "03" and "04", and the remaining assembly will have its disassembly code set to "05".

For each of the four assemblies, there is a separate set of data modules which will be identified with the appropriate setting of disassembly code to "02", "03", "04" and "05", as appropriate. Under the appropriate maintenance actions, accessories are further disassembled as shown, that is, into assemblies/parts that do not require further maintenance actions.

The subject of disassembly, "05", is more complex in structure. Under maintenance actions, it is further disassembled into three subassemblies which in turn are subject to maintenance actions. This gives further data modules with their of disassembly codes set to "06", "07" and "08", respectively, to support each of the disassembled items.

The subjects of disassembly, "06" and "07", are further disassembled under the appropriate maintenance actions, with an additional assembly requiring maintenance actions resulting in each case, ie subjects of disassembly "09" and "10".

There is no need to disassemble subject of disassembly "08" any further for the maintenance actions. There is, however, a requirement for a set of data modules as the assembly requires maintenance actions.

Finally, the subject of disassembly "09" is subjected to final disassembly within the scope of the appropriate set of data modules. The subject of disassembly "10" is not disassembled further but is itself subject to maintenance actions.

ICN-AE-A-004003-G-S3627-00027-A-01-1

*Fig 2 Disassembling principle - Complex example (Sheet 1 of 2)*

ICN-AE-A-004003-G-S3627-00028-A-01-1

*Fig 2 Disassembling principle - Complex example (Sheet 2 of 2)*

## 2.5 Examples

### 2.5.1 Example 1 - Hydraulic assembly

All information (ie the supporting set of data modules) relating to the complete hydraulic assembly has its disassembly code set to "00" in accordance with the rules for the subject of disassembling as shown in Fig 3. The assignment of further disassembly codes in support of items further disassembled, for example, can be found under Information Code "041" (constructional description, see Fig 4).

In this case, assemblies without a number require no further maintenance actions. The number of further disassembled subjects is, therefore, seven ("01" to "07"). The disassembling of the hydraulic assembly itself is also a maintenance action which relates to the complete equipment and will, therefore, be coded using disassembly code "00" as shown in Fig 5.

The disassembled subjects "01" to "07" are allocated their own set of data modules, each of which is coded using the respective disassembly code setting ("01" to "07"). In this example, the disassembled subjects "01" to "07" are further disassembled within the scope of maintenance actions. The pertinent figures and data module codes for these disassembly actions are shown in Fig 6 thru Fig 12.

### 2.5.2 Example 2 - AFDS computer

The removed complete computer, (disassembly code "00"), is shown in Fig 13. Fig 14 shows further disassembled subjects.

As a particular feature of this example, assembly "01" is disassembled into two further subassemblies, "14" and "15" as shown in Fig 14. Both subassemblies are subject to maintenance actions.

The disassembly of the complete computer into its assemblies is as shown in Fig 15, and the disassembly of the subject with the disassembly code set to "01" is shown in Fig 16. Further disassembly of subjects with disassembly codes set to "02" and "03", are shown in Fig 17 and Fig 18, respectively.

## 1 General

To assist with authoring in a CSDB environment general guidance is given. Authoring in this environment is fundamentally different from traditional processes. There are rules, which are generic and applied to all data module types. There are other rules that are applied to specific data module types.

### 1.1 Purpose

The purpose of this chapter is to introduce the rules for authoring.

### 1.2 Scope

All authoring aspects for all data module types are covered in the subchapters of this chapter. In most cases there are business rules decision points associated with the data modules types on

which the project or the organization will have to make a decision. Chap 2.5 gives guidance on business rules.

# 2 Authoring

The rules and guidance for authoring are given in the following chapters:

- Chap 3.9.1 provides the general writing rules to be followed in the preparation of text. The rules set out the guidance for the preparation of operator and maintenance information.
- Illustrations are prepared to help the reader's understanding of the text, by amplifying and clarifying it and avoiding lengthy explanations. The rules for illustrations are detailed in Chap 3.9.2.
- Definitions, creation and use of warnings, cautions and notes are given in Chap 3.9.3.
- Chap 3.9.4 gives the rules for the creation of front matter data modules.
- Chap 3.9.5 explains markup including the basic XML terms and definitions.
- Definitions, creation, use and rules for the elements and attributes for the identification and status section are given in Chap 3.9.5.1.
- All the rules for the different data module types are given in Chap 3.9.5.2.

# 1 General

There are three methods of producing data modules:

- document production using traditional editing or What You See Is What You Get (WYSIWYG) systems
- XML production
- database driven production

The traditional production requires the author to manually enter most of the information, including titles/headings, etc. Headers and footers, table of contents and other introductory lists are typed or auto generated by the system. The author also selects the right element in the template (style sheet) to get the correct presentation.

By using an XML based editor, the author can concentrate on the content of the information, within the bounds of the structure. The presentation (including headers, footers, introductory lists, if page-oriented presentation) is delegated to the production and presentation application.

S1000D facilitates the first two production methods for all types of data modules. However, the third method can be used for the production of any non-text oriented data modules, ie IPD, wiring data and maintenance planning data, fault, technical repository data, etc.

Chap 3.2 and Chap 3.9.5 define the structures available to the author when creating a document. Chap 6.2 provides the detailed rules and examples of S1000D standard presentations for page-oriented publications. Chap 6.3 provides basic rules for look and feeling of IETP.

This chapter describes the basic writing rules for creating technical information in data modules.

**Note**

Chap 6.2 shows the presentation of page-oriented publications. However the structure (the use of text and graphics components) explained in this chapter are valid and independent of the presentation form.

# 2 General writing rules

## 2.1 Language

The project or the organization will specify the language in which the data modules must be written. If that language is English, then the project or the organization must decide whether to use the writing rules and vocabulary in Simplified Technical English® (ASD-STE100) or not.

A standard dictionary must also be designated by the project or the organization. If the maintenance data for the data modules is required in the English language, it is recommended that the Webster's Dictionary be used as the standard.

If specific maintenance terminology is required, it is recommended that either a terminology database, or project glossary of such terminology is produced or cross-references are made to existing glossaries/specifications. It is essential that the maintenance terminology be agreed by all disciplines within the project. Ideally, this will include the Product names and task short descriptions.

## 2.2 Abbreviations

An abbreviation is a shortened form of a word, expression or phrase and is used to conserve space and time. To ensure consistency throughout all the project documentation (including data modules), it is recommended that either a standard list of abbreviations be produced at the start of the project or existing abbreviation standards used both of which can be included in the project terminology database. Some suggested general rules on the use of abbreviations are given below:

- Only use an abbreviation when its meaning will be clear to the reader. When in doubt spell it out
- Wherever possible, use abbreviations that conform to a recognized standard used by, or made available to, the customer
- Abbreviations not in common use, or not to a recognized standard, but which are used frequently, can be put in brackets after the word, expression or phrase, when used for the first time. Thereafter the abbreviation can be used
- Use the same abbreviation for the singular and plural
- Do not use full stops [.] in abbreviations except for where their omission would create ambiguity (eg "No." for number and "in." for inch to avoid confusion with "no" and "in"). Stops are also not required for contractions (eg "Mk" for a specific mark) or for shortened identifications, acronyms, (eg "North Atlantic Treaty Organisation (NATO)" for the North Atlantic Treaty organization and "STN for Special Technical Notice)
- Avoid the use of abbreviations in contents lists, titles etc wherever possible (eg "Operation of the HLWSCU" is meaningless unless you know that the HLWSCU is the High Lift Wing Sweep Control Unit). However, for air systems SNS 24-20 in this specification, use "Alternating Current (AC) Generation", and this abbreviation must be used
- Abbreviations used on placards, labels and signs must be replicated in data modules, even though they may not conform to recognized standards or these suggested rules. If the text given on placards, labels and signs is shown in uppercase letters, then the text must be written in uppercase letters in the related text in the data module, eg "Put the warning placard DO NOT OPERATE THE LANDING GEAR on the landing gear handle", "Connect the ground electrical connector to the OUTLET SUPPLY receptacle on the leak test set". This does not apply to the text that is given on tools.
- A list of all non common abbreviations, which are not among the recognized standards required by the customer, can be included in the data module. (Information code "005" can be used to list abbreviations)

## 2.3 Information affected by modification

Information must be provided on any changes introduced by modification to the build standard of the Product. Data modules affected by such information must be arranged so that, when all Products are modified, non-applicable information can be removed without an entire rewrite of the data modules.

## 2.4 Numeric values

### 2.4.1 General

Wherever possible, the rules concerning the expression of numerical values must be in compliance with International Standards Organization (ISO) 6093 Information processing - Representation of the numerical values in character strings for information interchange.

Unless otherwise stated, all numeric values, eg speeds, Mach numbers, accelerations, temperatures and altitudes, quoted must be as indicated on the equipment.

When a range of values is associated with a unit, the unit symbol must be repeated after each number, eg "2,3 mm to 7,8 mm". When a value followed by a tolerance is expressed, both must be in the same units, but the unit need only be placed after the complete expression. The mathematical presentation (eg 12 ± 1 mm) is the preferred one. However, if this is not possible, the complete expression (12 plus or minus 1 mm) can also be used.

Numbers from one to nine normally must be expressed as words when used in text, except when used in a dimensional sense or for reference purposes. Numbers of 10 and over must be expressed in Arabic numerals except where ambiguity might otherwise result (eg two hundred and fifty 27 mm cartridges).

### 2.4.2 Fractions

The use of a fraction can be avoided, by using decimal notation or words, except where indicators or controls are marked in vulgar fractions. Fractions must be presented in text using the slash [/] character, with one space separating a whole number from a fraction, (eg 1 1/2). When super- and sub-script are used, then there must be no space between the whole number and the fraction (eg 1½).

### 2.4.3 Separators

The decimal separator is a comma [,] in compliance with ISO 31-11. This separator must be used together with International System (SI) units, Refer to Para 2.5. A dot [.] must be used as the decimal separator for Imperial or United States (US) units.

- SI-units comma [,]
- Imperial-US/units dot [.]

Numbers less than unity have their decimal separator preceded by a zero in all cases, (eg 0,012).

Very large or very small numbers expressed to a reasonably small number of significant figures, can be conveniently set out when written manually as multiples of a power of ten to simplify their presentation.

Examples:

- 2998000000 becomes $2,998 \times 10^{9}$

or

- 0,000000000006624 becomes $6,624 \times 10^{-12}$

Presentation of numbers generated from, for example, a database can vary according to the system being used.

## 2.5 Units of measurement

The SI units of measurement must be used within all publications. Where non-SI units are quoted (eg for a pressure gauge calibrated in psi), the SI conversion is to be included in brackets. The SI conversion is to be rounded up or down to a corresponding number of significant figures. The one exception to this rule is the case of Nautical Miles.

ISO Standard 1000 must be used for the presentation of unit symbols. Some general rules for presenting unit symbols are:

- when in doubt, spell the name of the unit out
- do not use the point after the unit symbol (eg A = Ampere, mm = millimeter)
- do not use an "s" for plurals
- put a one-character space between the unit symbol and the unit quantity
- use the units given on gauges, indicators, etc

## 2.6 Names

To ensure consistency throughout all project documentation, including data modules, it is recommended that standard names (for materiel, equipment, components, assemblies, parts, etc.) be used throughout all disciplines of the project. Normally, engineering drawings are the source data for names. The drawings are used as the verified source data to produce, for example, the IPD data modules.

Markings on controls must be quoted as marked. Where a control selection exists but is not actually marked, it must be described fully.

Consistency of names must always be maintained between text and illustrations in data modules. Terminology that conveys the purpose, function, or nature of an item irrelevant to a procedure requirement should not be used. For example, the spoiler center wing input quadrant need not be called such in a procedural step to insert a rig pin. The presence of an illustration showing the location of the quadrant enables the step to be written simply (eg "Insert the rig pin in the quadrant" or "Insert the rig pin") when there is only one quadrant and one rig pin. Modifiers are only necessary when more than one item of the same name is acted upon in the same procedure.

## 2.7 Basic punctuation rules

STE is recommended as a guide for the use of punctuation marks in maintenance data. STE states that semicolon [;] is not permitted. Specific rules for lists are given in Chap 3.9.5.2.1.3 and for titles in Chap 3.9.5.2.1.5.

## 2.8 Use of uppercase

All text must be written in lowercase. Sentence case (the first letter in a sentence is given in uppercase) or, where appropriate, all uppercase must be used for specific abbreviations, acronyms or expressions. The following examples are specific expressions:

- Chap, Para, Fig, Table, WARNING, CAUTION and Note are specific expressions.
- Titles with a "hyphen" must use an initial uppercase after the dash, eg Corrosion control - Rudder.
- Titles with a "slash" [/] must use initial uppercase after the slash if it is the first set of word in a sentence, eg Module/Publication must.
- Titles of an information set or a publication (Refer to Chap 5) must be written with initial uppercase, eg Weapon loading, description and operation.
- When explaining an acronym the first time in a data module the corresponding initials must be in uppercase, eg CPF.

Placards, labels and signs must be replicated, including uppercase, when referenced in data modules. Refer to Para 2.2.

## 2.9 Highlighted text

To highlight a word, an expression or a sentence, bold text is the preferred method. Alternatively, the use of color is permitted. Uppercase, italic or underlining are not permitted to highlight text, except for legacy data.

**Note**

Exceptions are the captions WARNING which are underlined and bold and CAUTION which are bold. Refer to Chap 3.9.3.

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Specify the language**. The project or the organization must specify the language that data modules will be produced in. Refer to Para 2.1.

**Use of Simplified English**. When data modules are produced in English, the project or the organization must decide whether to use Simplified English or not. Refer to Para 2.1.

**Use of a standard dictionary**. The project or the organization must decide which standard dictionary is used for producing data modules. Refer to Para 2.1.

**Terminology database or glossary**. The project or the organization must decide whether to use a terminology database or a glossary. Refer to Para 2.1.

**Use of a standard list of abbreviations**. The project or the organization must decide whether to use a standard list of abbreviations, or not. Refer to Para 2.2.

**Agree on a standard list of abbreviations**. If used, the project or the organization must agree on a standard list of abbreviations. Refer to Para 2.2.

**Highlighting text**. The project or the organization must decide whether to use bolding or color to emphasize text. Refer to Para 2.9.

| Chap 7.3.3 | CSDB objects - Multimedia |

## 1 General

This chapter provides general guidance and rules on authoring illustrations and multimedia objects:

- Chap 3.9.2.1 provides the primary rules for the creation of 2D illustrations with basic illustration examples
- Chap 3.9.2.2 defines and explains navigation and configuration of illustrations
- Chap 3.9.2.3 covers the use of color in illustrations and photographic images
- Chap 3.9.2.4 provides the primary rules and details the minimum standards for the creation of audio, video, animation 2D or 3D multimedia objects with basic examples provided
- Chap 3.9.2.5 covers 3D multimedia objects including dynamic and interactive technical content

# 2 Project guidance

This chapter covers the delivery of many different media types with a wide range of project requirements in mind. As a result where this chapter cannot mandate output media types it will give guidance and the minimum specified requirements. It is strongly recommend that projects use open specifications when delivering multimedia and that proprietary types are discouraged as a media object type. Refer to Chap 7.3.3. It is also essential that project business rules governing the delivery of media objects types are agreed with exchange and maintenance strategies in place and specified in the configuration file.

## 2.1 Illustration rules - Introduction

Illustrations must be prepared to amplify and clarify the text and to avoid lengthy explanations. They must be located as close as possible to the related portions of the text.

Before the production of project documentation begins, the parts of the documentation which have to be printable must be defined. It must also be clarified if the customer is in a position to provide all end users with the technology to use electronic publication functionality such as color displays and color printing. When colored illustrations are to be printed using black and white, it must be ensured that the print medium can handle the file content.

Chap 3.9.2.1 gives rules and guidance for the production of illustrations which have to be presented on paper or on screen. The basic set of rules is common for both environments but specific rules apply. The final requirements must be considered within the project business rules.

The rules applied to IPD illustrations can also be used for the production of illustrations during the initial provisioning process. Such a process is defined in S2000M.

The illustrations used in the IPD publication are identified as "Figures". The purpose of these figures is to clearly depict the detailed parts in disassembly order. If one illustration page is insufficient for the presentation of an assembly, a figure is spread over several illustration sheets.

## 2.2 Multimedia - Introduction

The implementation of multimedia elements to projects requires testing in the role in which it is to be used and support environment in which it will operate. Consideration must be given to display backgrounds, colors and presentation methods used. Working conditions such as, lighting, weather and noise levels can have a major impact on the ability to use or understand the presentation. All media projects must be appropriately tested before delivery.

Once all these factors have been considered and defined in the project requirements plan, agreement can then be reached on the user interface and delivery methods to be deployed.

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Scope of printable data**. The project or the organization must determine which parts of the documentation need to be printable.

**Multimedia technologies and environment**. The project or the organization must agree to the multimedia technologies and the expected environment in which it will operate.

# 1 General

This chapter provides the primary rules for the creation of 2D illustrations with basic illustration examples.

# 2 The primary rules of illustration

Illustrations must communicate to the user in a simple, clear and economical way and visually enhance the technical information required by the user to perform the intended task. Illustrations must be prepared in accordance with the text and other information in data modules, such that the end user receives the maximum amount of information (description of systems, components, operation, task execution, etc).

The following is a general guide to help the illustrator and publication designer create illustrated information inline with the above principles:

- The information given must provide the end user with the maximum information for the output media (on paper or IETP) used.
- Illustrations must be prepared to present the view and scale that is most favorable for the user.
- Illustrated parts must be clearly identifiable to the user and annotated appropriately. If required for clarification, a location drawing (refer to Chap 3.9.2.2) and/or direction indicators are used.
- Location arrows, leader lines, annotations, etc must be clearly shown and free from surrounding detail.
- Reusability and uniformity are of prime importance for clarity and the complete set of information. Uses of "typical" and "natural" views for similar equipment are important elements in good illustration.

- The illustrations must be clear, showing only the detail required and what is being described to the user. The inclusion of unnecessary details, such as shaded areas, as well as the presentation of detailed parts not visible in the perspective view by using broken lines, must be avoided. Fig 1, Fig 2, Fig 3, Fig 4, Fig 5 and Fig 6 give the general rules for the clarity of illustrations. The exact presentation of details, such as threads on screws or their head style, can be omitted. Limit the artistic effects, do not use shadow effects. The use of artistic embellishment is to be limited and only used to add visual clarity for the user.
- The level of detail in the illustration must be measured, simple and relevant to the amount of information that the end user can process. Highly detailed source material like 3D Computer-Aided Design (CAD) data, digital mockups or 2D drawings, can risk complex and unnecessary modifications.
- Always construct the layouts, building the illustrations logically and in sequence in accordance with Chap 3.9.2.2.
- Graphics must be produced to a realistic and sensible size. Whenever the scale of a graphic does not allow small detail to be clearly shown, these details must be enlarged.
- Where the disassembly order or detail parts can be properly identified from the plan view representation of a production drawing, that representation must also be used in the illustration. This form is applicable to items such as hose assemblies, control rods, clamps, instrument panels, circuit boards or ground equipment. Refer to Fig 7, Fig 8, Fig 9, Fig 10 and Fig 11.
- Do not overcrowd the illustration reproduction area.
- If several identical parts are used in the same assembly, only one of them need be illustrated if it is possible to positively allocate them to their respective location and/or orientation.
- Wiring or system diagrams, schematics or other charts where symbols are used are also acceptable as an illustration if they provide for the proper identification of the detail parts. Refer to the black and white example in Chap 3.9.2.3.
- The project must decide if schematics derived from engineering drawings include the original drawing number and revision status within the illustration reproduction area.
- Present graphics in accordance with the output media.
- Consider final requirements within project business rules.

## 2.1 Mode of presentation

### 2.1.1 Specific rules and recommendations for illustrations in page-orientated publications

For ease of reading and cross-referencing, the preferred layout is portrait (IPD illustrations are always to be in portrait layout). Foldouts or landscape are only allowed as exceptions, as defined in the project business rules.

### 2.1.2 Specific rules and recommendations for IETP illustrations

In comparison to the page orientated (paper) documentation, the following deciding restrictions are no longer relevant or additional possibilities are available for screen presentation:

- Fundamentally, no constant, printable page layouts are required. Only the necessary illustration part is displayed on the screen in the required size. However the need for printing of data module pages or the illustration itself must be considered.
- Objects are named to facilitate easy reference to multiple components of an illustration that have the same name. For example, graphic objects can be given a name applicable to a certain configuration with the same name. It can also be useful to name sets of hotspots that need to be turned on and off. Naming schemes and groupings must be coordinated.
- Information regarding graphic object identifiers, names, or coordinates that will be referenced in an IETP must be documented and communicated in such a manner that hotspots can be defined.
- The use of color to show the clarity of important information has priority.

– All forms of picture presentation can be used, such as color photographs, bitmaps of 3D models and electronic legacy data providing that they are in accordance with the data format in this specification.

## 2.2 Illustration sizes, line weights, typeface and type size

### 2.2.1 Illustration sizes and orientation

The following illustrations sizes can be used in data modules: full page, flexi height and landscape fold out. The final illustration reproduction areas are given in Table 2.

*Table 2 Illustration reproduction areas*

| Page sizes | A4 and US A size publications | A5 publications | US 5 inch x 8 inch publications |
|---|---|---|---|
| Full page | 170 mm x 222 mm[1] | 120 mm x 157 mm | 105 mm x 137 mm |
| Flexi height | 170 mm x (45 thru 210 mm)[2] | 120 mm x (30 thru 175 mm) | 105 mm x (25 mm thru 137 mm) |
| Fold out | 360 mm x 222 mm | 254 mm x 157 mm | 222 mm x 137 mm |

1 Illustrations primarily to be used in illustrated parts data must always be full page A4, ie 170 mm x 222 mm
2 Using height 210 mm allows for a heading on the top of the page

For illustrations used as symbols in the text, the illustration reproduction area is the symbol size.

The preferred illustration reproduction area sizes, defined in Table 2, are used as a guideline when producing IETP illustrations. The preferred orientation is portrait. However the final size and orientation of an illustration for an IETP must be designed and delivered around the individual project. The project or the organization must bear in mind the need for printouts from the IETP.

### 2.2.2 Line weights, and text style

#### 2.2.2.1 Line weights

Line weights, typeface, type sizes, symbols in illustration representation and general standards are all defined in this chapter as they would appear at a scale of 1:1 in a paper publication. Table 3 gives a summary of line weights and their primary use.

**Black and white illustrations**. Line weights, typeface and type sizes in illustrations must be prepared according to the rules shown in Fig 1.

**Color illustrations**. Line weights, typeface and type sizes in illustrations must be prepared according to the rules shown in Fig 2 and/or Fig 3.

**Note**

The dashed (170 mm x 222 mm) border line in Fig 1, Fig 2 and Fig 3 gives the illustration reproduction area and can be used to check the scale.

The distance between two lines must at least be equal to the sum of the weights of these lines.

The project or the organization must decide if color is used in the final deliverables.

*Table 3 Lines - Their primary use and weights*

| **Line weight use** | **Color illustration, 2 line weights** | **Color illustration, 3 line weights** | **Black/White illustration, 3 line weights** |
|---|---|---|---|
| | Weight Fig 3 | Weight Fig 2 | Weight Fig 1 |
| Hidden lines, leader lines and center/projection lines, line shading and section lines, location drawings, reference structure/items | 0,18 mm | 0,18 mm (or 0,25 mm) | 0,18 mm (or 0,25 mm) |
| Illustration of items | 0,18 mm | 0,35 mm | 0,35 mm |
| Highlighted items and highlighted reference structure | 0,50 mm | 0,50 mm | 0,50 mm |

ICN-AE-A-030902-G-S7282-00372-A-05-1

*Fig 3 Color illustrations - General rules, 2 line weights*

2.2.2.2 Text style

The text annotation font must be of Sanserif type (eg Univers, Helvetica, Arial). The size must be 8 pt to 10 pt light (Cap-height 2,0 mm to 2,7 mm), written in uppercase or sentence case as decided by the project.

Basic rules for use of capitals (uppercase characters) and highlighting of text apply. Refer to Chap 3.9.1.

The font for item numbers must be of Sanserif type (eg Univers, Helvetica, Arial). The size must be 10 pt light (Cap-height 2,5 mm to 2,7 mm). Refer to Fig 4 and Fig 5.

**Note**

Exception is made for wiring diagrams or similar situation where the text style is ruled by the settings in the diagram generating application.

## 2.3 Symbols

### 2.3.1 International System of units (SI units) and symbols

In general, Système International d'Unites (SI) units and International Standards Organisation (ISO) standards apply as stated in the writing rules. Projects however, can specify additional standards.

### 2.3.2 General symbols

General symbols for illustrations and photographs (eg arrows and direction indicators) must be prepared in accordance with the examples given in Fig 4 and Fig 5. Hatches, solids, raster and pattern fills must apply as given in Fig 6. Refer to Chap 3.9.2.3.

## 2.4 Halo

To clarify the readability of an illustration it is necessary to emphasize eg the path of a leader line to a component when they intersect other geometry inline drawings and photographs. This is achieved by the use of a halo:

- on each side of leader lines, hidden lines, center/projection lines and reference structure/item lines
- around dimension arrows, brackets, direction arrows, multipliers, etc

The halo must be approximately 1 mm on each side of the general symbols. Refer to Fig 5.

ICN-AE-A-030902-G-S3627-00004-A-10-1

ICN-AE-A-030902-0-U8025-00562-A-02-1

*Fig 6 Standard fills*

## 2.5 Type of illustrations

Normally, illustrations are prepared as line drawings. Subject to agreement with the customer, full color illustrations, photographs and monochrome (half tones) can be used, provided they meet all requirements to show clear details. Again, cognizance is to be taken of any project output requirements. The following types of drawings are used:

- **Isometric projection** (30°/30°, ellipse 35°). This is the preferred 3-dimensional drawing method for detail, exploded views or larger installations and must remain in the classical LTF (left top forward) orientation. Refer to Fig 1, Fig 2 and Fig 3.
- The **exploded view** of IPD illustrations must be shown in the correct disassembly order. If necessary, details can be shown in a different isometric orientation.
- As an alternative, **trimetric projection** can be used.
- **Perspective**. Normally used only for abnormally large components such as aircraft fuselage, wing sections and tail assemblies. Perspective can also be used for location drawings. For technical publications, the orientation of the mechanics viewpoint is permitted.
- **Orthographic projections**. These 2-dimensional illustrations are used each time this kind of presentation adequately serves the purpose.
- **Diagrams/Schematics**. This type of presentation is used to explain the operation of a system or a circuit.
- **Graphs**. This type of representation is used to explain the relation between various parameters.

## 2.6 Resolution for illustrations

The preferred resolution for illustrations is 300 dots per inch (dpi). The data standards definitions for the incorporation of images are described in Chap 4.8.

## 2.7 Use of hatch styles, solids, raster and pattern fills

To highlight areas, show flows or to differentiate materials, hatch styles, solid, raster or pattern fills are used. When using color fills bear the output demands in mind.

The recommended hatch styles, solids, raster and pattern fills are given below.

The S1000D and ATA/Aerospace Industries Association of America (AIA) graphics standards are still undergoing harmonization work and a defined set of fills with a proposed statement of use will be issued later. The approved use and defined style of CGM hatch style definition settings are given in Table 4 below. Refer to Fig 6.

**Hatches**: The CGM Version 3 "Hatch Style Definition" element allows for the definition of a hatch style and associates it with an index by which it can be used within the graphic.

The indexes are negative, to avoid conflict with standardized or registered values.

The duty cycle length settings in the following Table 4 are based on a unit of 0,0254 mm. Table 4 gives the hatch style definition settings.

**Solids**: This fill type allows for the use of color values to indicate filled areas.

**Raster**: This fill type allows for the use of predefined raster to indicate filled areas.

**Pattern**: This fill type allows tiled designs represented as a bitmap. Standard pattern indexes have not been defined.

*Table 4 Hatch style definition settings*

| Hatch index | Style indicator | Hatch directions | Duty cycle length | Number of hatch lines | List of gap widths | List of line types |
|---|---|---|---|---|---|---|
| -1 | Parallel | 45 | 28 units | 1 | 4 | 1 |
| -2 | Parallel | 135 | 28 units | 1 | 4 | 1 |
| -3 | Cross | 45, 135 | 28 units | 1 | 4 | 1, 1 |
| -4 | Parallel | 45 | 49 units | 1 | 7 | 1 |
| -5 | Parallel | 135 | 49 units | 1 | 7 | 1 |
| -6 | Cross | 45, 135 | 49 units | 1 | 7 | 1, 1 |
| -7 | Parallel | 45 | 70 units | 2 | 3, 7 | 1 |
| -8 | Parallel | 135 | 70 units | 2 | 3, 7 | 1 |
| -9 | Parallel | 45 | 70 units | 1 | 10 | 1 |
| -10 | Parallel | 135 | 70 units | 1 | 10 | 1 |
| -11 | Cross | 45, 135 | 70 units | 1 | 10 | 1, 1 |
| -12 | Parallel | 45 | 98 units | 2 | 4, 10 | 1 |
| -13 | Parallel | 135 | 98 units | 2 | 4, 10 | 1 |

## 2.8 Information Control Number - ICN

Each illustration must be allocated an ICN. If specified to appear on the illustration reproduction area, the ICN is located within the lower right hand corner as shown on Fig 1, Fig 2 and Fig 3.

In order to avoid redundancy, an illustration sheet can be referred to in different contexts. Thus an illustration sheet can belong to different figures with different titles.

The ICN addresses an illustration sheet including its update status independently of the status of a data module or publication where it is used within a figure.

The details describing the use of ICN and its breakdown are laid down in Chap 4.4. Refer to Fig 7.

ICN-AE-A-030902-0-C0419-00118-A-02-1

*Fig 7 Illustration example - Plan view non-exploded*

## 2.9 Reference illustrations/structure

Reference illustrations (phantom representation) of structure and assemblies which are not part of the assembly to be illustrated, but which show assembly relationship, are to be shown using reference structure line weights or defined colors without item numbers and leader lines. Wherever possible, reference illustrations are not itemized. Refer to Fig 1, Fig 2, Fig 3, Fig 8 and Chap 3.9.2.3.

ICN-AE-A-030902-G-S7282-00148-A-04-1

*Fig 8 Illustration example - Item tabulation of similar content*

## 2.10 Callouts and leader lines

### 2.10.1 General

Callouts can be written as annotations (direct annotations) or as item numbers (indirect annotations). If item numbers are used, they must be explained in a legend within the illustration reproduction area or in the related text. The indirect method of annotations is preferred, especially if the data module or technical publication has to be translated. Refer to Chap 3.9.2.2 and Chap 3.9.2.3.

General guidelines for item numbers:

- Use a separate graphical text element (in a sensitive area) for each item number. This applies equally to tabulated items and multiple indexing (refer to Fig 8 or Fig 11).
- Use three separate graphical text elements for mirrored items, the first for the opening bracket, the second for the item number and the third for the closing bracket (refer to Chap 3.9.2.2).
- Use uppercase letters for item number variants. Refer to Chap 3.9.2.2.

If it is necessary to quantify an item number (attaching parts), use lowercase multiplier "x" as shown in Chap 3.9.2.2.

General guidelines for multipliers:

- Put the multiplier and the appropriate quantity to the right of the respective item number.
- Leave a space between the item number and the multiplier information (eg "1 x3").
- Use two separate graphical text elements (in sensitive areas) in the illustration.
- Do not use multipliers if an item is cross-referenced and shown more than once, regardless if the item number is the same or different.

Examples of multiplier presentations are shown in Chap 3.9.2.2. For the text style of callouts refer to Para 2.2.2 and Fig 1, Fig 2 or Fig 3.

Leader lines must:

- be as short as possible
- stop the line before an item
- be stopped with a dot when entering a part
- only have arrowheads in exceptional circumstances to promote clarity (eg in graphs)
- be "laid free" (halo) to clarify the path to the component when they intersect other geometry

### 2.10.2 Item numbers and leader lines in IPD illustrations

In addition to the above, the following rules apply for the annotation of IPD illustrations:

The number of locations shown in the illustration must correspond with the quantity per next higher assembly indicated in the text for the item. This requirement can be achieved by the following methods:

- by illustrating and separately referencing the different locations of an item. Refer to Fig 12, Item 26.
- by the number of leader lines (more than one leader line pointing to the same item number). Refer to Fig 12, Item 28.
- by the number of identical key characters (letters) if a detail illustration applies to more than one location. Refer to Chap 3.9.2.2 and Fig 12, Item A.
- By using the multiplier "x" after the item number followed by the appropriate quantity. This procedure is permissible only if all locations cannot be shown (refer to Fig 12, Item 4) or where, for practical and economic reasons, it is desirable to omit additional reference lines (eg where installation locations are clearly identifiable but the extensive use of additional information such as repetitive item numbers, detail illustrations, etc would make an illustration unnecessarily difficult to read). Refer to Chap 3.9.2.2.

If hotspots are needed for the production of the IETP IPD information set, links between the illustration and the IPD data can be provided using the element <hotspot> in accordance with Chap 3.9.5.2.1.8.

## 2.11 Center lines/projection lines

Center lines/projection lines are used in illustrations to indicate how detail parts and assemblies match.

The projection line must be routed through at least one hole, or to a prominent reference point of the detail part/assembly.

Projection and centerlines must be "laid-free" at the intersection with other geometry.

The centerline represents the imaginary line through a center of an item/assembly.

If possible, projection lines/center lines must be without bends or 90° turns.

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Engineering numbers and revision status**. The project or the organization must decide if schematics derived from engineering drawings include the original drawing number and revision status within the illustration reproduction area. Refer to Para 2.

# 1 General

This chapter defines and explains navigation and configuration of illustrations. It is to be used in conjunction with Chap 3.9.2.1.

# 2 Navigation and configuration content

This chapter covers various aspects, production, and use of navigation symbols with rules and guidance for the configuration of illustrations.

## 2.1 Navigation rules

### 2.1.1 Use of hotspots

Hotspots are sensitive areas in illustrations necessary for creation of links used to navigate within technical publications. This area can be activated by hyperlinks from:

- text in a data module to one area of an illustration
- text in a data module to several areas of an illustration
- one area of an illustration to the data module text
- one area of an illustration to another area of the same illustration
- one area of an illustration to an area of another illustration
- one area of an illustration to another data module
- one area of an illustration to parts information

The sensitive area can be represented by:

- callout numbers (can include the leader line)
- the itemized graphic elements or their surface
- callout numbers including leader lines and itemized graphic elements (or their surface)

Highlighting the sensitive area by touching with the cursor is a viewer constraint. Examples of sensitive areas and their presentation are given in Fig 1.

| Sensitive areas | Presentation | Type | Example given in |
|---|---|---|---|

*Fig 1 Sensitive area examples and their presentation*

A hotspot can be turned on or off by changing the visibility of the sensitive area. A hotspot is considered visible unless the attribute `visibility` of element <`hotspot`> overrides the default.

To set up links between data module text and illustrations, or between illustrations, cross-reference identifiers are necessary. The required target address is the identifier of the hotspot within the illustration.

The sensitive area is defined by using the WebCGM Application Structure (APS) attribute `region`. The display area of the target in a graphic is defined by the WebCGM APS attribute `viewContext`.

For the creation of hotspots and the control of dynamic behavior of the illustration, the S1000D CGM profile defined in Chap 7.3.2 applies. The methods of implementing and using hotspots are given in Chap 3.9.5.2.1.8.

### 2.1.2 Graphical access

The graphical access to information in an IETP can be achieved with illustrations and hotspots to relevant data modules. This is helpful if the user knows the item but not the name or naming conventions.

As well as using the table of contents via viewer to get access to the applicable part of the document, the user can also use illustrations in different detailed sections. This is achieved by the use of hotspot technology and the applicable detailed illustrations as described in Chap 3.9.5.2.1.8. This chapter includes the concept of defining and accessing information about an illustration in addition to its visual image for the purpose of hyperlink and navigation.

## 2.2 Figure title and number

In order to establish the relationship to the text of a data module or publication, illustrations must be given figure numbers and titles. The figure number reflects the sequence in the data module or publication.

For IPD illustrations, the figure title must be identical with the description for part given against the item number "0" (zero) of the figure.

Figure titles are part of the data module or publication text.

Figure numbers must be generated on output only.

The figure number, followed by the title, must be centered at the bottom of the page outside the illustration reproduction area. The figure number and the title must be separated with two blanks. If an illustration requires several illustration sheets, the note (Sheet X of Y) must be added at the end of the title as shown in Chap 3.9.2.1. Figure number, title, and note are not to exceed two lines.

Illustrations used as symbols (element <symbol>) are not to be given a figure number, figure title, nor have the ICN presented/printed.

As an alternative, an individual figure number can be appended to each illustration sheet, eg:

- Fig 7.1 Computer (Sheet 1 of 2) and Fig 7.2 Computer (Sheet 2 of 2)
- Fig 1 Pump (ACDC) (Sheet 1 of 2) and Fig 1 Pump ACDC (Sheet 2 of 2)

**Note**

In this issue of S1000D, the figure numbering follows both the basic rules and the alternative with individual unique figure numbers.

## 2.3 Location drawings

The location drawing normally appears in the upper left corner of the illustration. It shows the position of the assembly relative to the vehicle/equipment/assembly and represents the view most favorable for the illustration. In the case of airframes and engines, this can be supplemented by adding stations (STA), zones (Z), or frame (FR) areas.

The part to be pointed out in a location illustration or photograph can be identified by darkening the outlines, blackening or standard blue or using tints. Location illustrations are not required where the illustrated system or assembly can be positively located. Refer to Fig 2.

If a detail part can be properly identified in an overall view, the illustration of the part need not be exploded. Refer to Chap 3.9.2.1.

Examples are shown on Fig 3, Fig 4, Fig 5, Fig 7, Fig 8, and in Chap 3.9.2.1 and Chap 3.9.2.3.

ICN-AE-A-030902-G-S7282-00153-A-04-1

*Fig 7 Illustration example - Cockpit presentation*

## 2.4 Illustration of views, details and sections

### 2.4.1 General

If enlarged views, details, and sections are to be shown, they must be located on the illustration in alphabetic order. It is preferable to start in the top right corner of the illustration with View A/Detail A/Section A-A (whichever applies) and proceed, if possible, in a clockwise mode locating as necessary.

Section cut-lines and section arrows must conform to the perspective of the view.

For location of hidden details not visible on main views, use broken locating arrows.

Use general symbols for presentation in accordance with Chap 3.9.2.1.

Examples are shown on Fig 3, Fig 4, Fig 5 and Fig 7.

### 2.4.2 IPD illustrations

The allocation of the capital letter identifying the "assembled item" is necessary where the "assembled items" cannot be shown in the main illustration (either they have a single collective part number, and therefore attract an item number, or not).

A location drawing refers out by means of an arrowhead and capital letter to a detailed illustration of an assembly (refer to Para 2.3). This assembly also has its own part number and therefore an item number, both, the capital letter and the item number will appear as shown in Chap 3.9.2.1.

If several separate detail part illustrations are necessary within the same figure, they must be initially identified on the first illustration sheet of the figure (ie in the main illustration). The detail part illustrations can then appear on additional illustration sheets, if necessary.

ICN-AE-A-030902-G-S7282-00007-A-06-1

*Fig 8 Illustration example - Navigation via frame stations*

## 2.5 Identification of electrical and electronic components

### 2.5.1 General

If electrical or electronic components require identification by circuit reference designators, the designators must either be included in a legend and/or within the associated text, but not included within the illustration itself.

In the case of orthographic illustrations, eg a printed-circuit board, item numbers applied within the boundary of the component or by leader lines can be used. Examples are shown in Fig 6, Fig 8 and Fig 9.

### 2.5.2 IPD illustrations

Electrical components in IPD illustrations must not be referred to in a legend or associated text. If annotations of the reference designators make an illustration difficult to read because of the congestion of annotations, an illustration must be repeated on several illustration sheets. Each sheet will identify a different range of the total number of components.

In an isometric view, the reference designator must be positioned near the item number of the relevant component.

If the illustrated size of components is insufficient for each to be annotated, the reference designators can be assigned to the components by the use of reference lines or by arranging them besides the component in such a way that their relationship to the component is clearly recognizable.

The use of reference designators does not replace the need for item numbers. Refer to Fig 10.

ICN-AE-A-030902-G-S7282-00149-A-05-1

*Fig 9 Illustration example - Identification of components on simple circuit board*

ICN-AE-A-030902-G-S7282-00008-A-05-1

ICN-AE-A-030902-0-C0419-00115-A-02-1

*Fig 11 IPD illustration example - Reference designator and item number*

## 2.6 Mirrored items

Illustrate the Left Hand (LH)/TOP/Forward (FWD) part only. If item numbers of the part not shown are different, then they can be contained within brackets below or above the item number of the illustrated part. The leader line must go to the item number of the part which is illustrated.

A deviation from this rule is permitted if the mirrored parts differ in detail or if for evaluation, it is preferable to illustrate another part, eg a right-hand part.

Appropriate references to the detail parts of a mirrored item, such as "LH only", "Right Hand (RH) only", "LH shown", "RH shown", can be included in the illustration. An example is given in Fig 2.

## 2.7 Illustration of different configurations

Illustrated configuration deviations normally record the appropriate Usable on Code Assembly (UCA), or Usable on Code Equipment (UCE), or the Effectivity next to the detail part concerned. Refer to Fig 11 and also S2000M, Appendix 1, Data Dictionary for details.

ICN-A-030902-G-S7282-00010-A-06-1

*Fig 12 Illustration example - Different configurations*

## 2.8 Item tabulation

In cases where visually similar components appear at a number of different locations within one figure, it is permissible to illustrate them only once. The locations and the item numbers can be indicated by multiple indexing or tabulation on the illustration. Refer to Chap 3.9.2.1.

## 2.9 Attaching parts (IPD illustrations)

If a number of identical attaching parts is used for a detail part or assembly, the installation locations of all attaching parts must be identified in accordance with Para 2.3.

If the order of sequence of the attaching parts can not be discerned from the illustration - but if it is absolutely necessary for comprehension - a breakdown example in the sequence of removal must be given.

Where identical attaching parts are fitted at several locations, but the orientation differs, the illustrations must be annotated to show the correct orientation at each fitment point.

Plate nuts must not be illustrated, but the bore must indicate their location and rivet holes on the respective component.

# 1 General

The electronic environment presents opportunities for the enhancement of graphical technical data by introducing color and photographic images. This chapter contains the required information and rules to produce and deliver color illustrations and photographic images to visually improve the users' interpretations of technical data.

# 2 Use of color and photographs

## 2.1 Rules and recommendations for color illustrations

The introduction of color has a profound effect in the way in which we can deliver technical information to the user. However, along with all the benefits it brings, caution must be used in the application of color in critical information situations. The following rules and recommendations must be used:

- In critical information situations, colors must be supported with another method of identification, distinctive symbols, markings, banding or wording. Refer to Fig 7, Fig 10 and Chap 3.9.2.1.
- If color is used and assigned a unique meaning to perform a described procedure then no more than six colors must be used. More than six and the user will experience difficulty remembering the entire assigned color scheme and this is detrimental to carrying out the described task. However this does not mean that only six colors can be used in any one project, it means that careful consideration is to be given when assigning specific colors and meaning to a task. Refer to Table 2 and Fig 1.
- The cultural color conventions must not be disobeyed, red is for danger, yellow for warning and green for safe or exit. Red and yellow must be reserved for alerts, warnings and selective highlighting. Refer to Table 3.
- Color must be used consistently throughout an IETP and in printed material preserving conventional practices and arrangements.
- Where color is used in unusual environments, artificial illumination, night vision goggles, red lighting and emergency situations the ability to display correctly as intended or appear as designed in printed material must be ensured.
- The implementation of color requires testing in the role in which it is to be used and support in the environment in which it will operate. Consideration must be given to backgrounds used, or which colors are positioned next to each other. Colors will appear different, lighter or darker, because of effects on color hue.
- For aircrew publications, the illustrations must use the appropriate color if the use of color on the displays has a semantic meaning. Refer to Fig 3.
- If appropriate, consideration is to be given to the visual compatibility and color accuracy with operational equipment or controls with the color information contained in IETP illustrations.

– If line drawings are produced from 3D engineering drawings, they are only modified to show important details more clearly. Different thickness of lines is not necessary in an IETP. The difference between the reference structure and callout parts must be presented by the different colors in the illustrations and defined in the project business rules.

### 2.1.1 Photographs

Photographs are still raster images, generated through one of the following methods:

– film or digital photography
– digital scanning
– nondestructive test methods
– computer generation

Photographs include photo-realistic computer generated images. Refer to Fig 2, Fig 3 and Fig 4.

Photographs can be used equivalent to line art illustrations, if the creation is more economic and applicable for:

– aged illustrated parts documentation
– maintenance tasks of crowded compartments
– training documentation
– documentation of non-destructive test results

## 2.2 Use of color

The prime objective of this section is to define the use of color, ensure uniformity and to deliver color accuracy in displayed and printed technical publications. However, this section can not define a "fits all" easy solution to color by assigning a unique or tight inflexible meaning to a whole spectrum of colors. This is unwise following careful research into color use and the resulting complexities of color behavior in unusual or special lighting environments.

Therefore with due consideration of too many factors, the following eleven color specification and guidance was produced. It was defined in joint consultation with the ATA/Aerospace Industries Association of America (AIA) and S1000D committees to define colors for illustrations in support of textual documentation. Refer to Fig 1.

### 2.2.1 The S1000D standard color palette

Table 2 gives the recommended S1000D standard color palette defined in Red/Green/Blue (RGB), Pantone and Cyan/Magenta/Yellow/Key (CMYK) values. The use of these colors is subject to the same guidelines and considerations as given in Para 2.1.

*Table 2 The S1000D standard color palette*

| Color | RGB value | Pantone value[1] | CMYK value[1] | | | |
|---|---|---|---|---|---|---|
| Red | R255 | Red 032 | C 0% | M 100% | Y 100% | K 0% |
| Yellow | R255 G255 | Yellow | C 0% | M 0% | Y 100% | K 0% |
| Blue | B255 | 300 | C 100% | M 43% | Y 0% | K 0% |
| Green | G255 | 375 | C 43% | M 0% | Y 79% | K 0% |
| Orange[2] | R255 G102 | 1585 | C 0% | M 60% | Y 94% | K 0% |
| Amber[2] | R255 G153 | 1385 | C 0% | M 38% | Y 94% | K 0% |
| Cyan | G255 B255 | 304 | C 31% | M 0% | Y 6% | K 0% |

| Color | RGB value | Pantone value[1] | CMYK value[1] | | | |
|---|---|---|---|---|---|---|
| Magenta | R255 B255 | 238 | C 18% | M 83% | Y 0% | K 0% |
| Light blue | R204 G255 B255 | 566 | C 23% | M 0% | Y 10% | K 0% |
| Light yellow | R255 G255 B204 | 600 | C 0% | M 0% | Y 20% | K 0% |
| Light grey | R204 G204 B204 | 420 | C 23% | M 17% | Y 17% | K 0% |

1 The Pantone and CMYK values are currently only a suggestion

2 While both orange and amber were deemed desirable by members of both ASD and ATA working groups, it is recommended that these two colors are not used together. In grayscale, amber appears as a darker grey than light blue or light grey. Refer to Fig 7 and Fig 10.

As appropriate, colors introduced into projects must be prepared according to the rules in Para 2.2.2 and as detailed in the standard color palette detailed above in Table 2. Refer also to the illustration examples shown in Fig 5, Fig 6 and Fig 7. The use of this color palette can also be applied to legacy projects.

Table 3 provides guidance for selecting colors.

ICN-AE-A-030902-0-U8025-00563-A-04-1

*Fig 1 Standard color palette*

**2.2.2 The use of color to represent a hierarchy of structure**

If color is used, it must represent the following hierarchy of structure. This means that colors used for an individual part will change between detail views, in accordance with its status within that view.

Refer to Fig 6 and Fig 7, where a part that is removed in a particular view will, along with its attaching parts, be light blue. Other parts within the main assembly can be removed in subsequent views and these will be highlighted in light grey.

Along with the appropriate navigational symbols, this will guide the user to the relevant detail view. In this view, the items to be removed and their attaching parts are now colored light blue. The original light blue assembly now represents background structure and is therefore shown in light yellow. This process can be repeated as necessary until the required stratum of information is attained.

If a project adopts hierarchical color representation for structure, then this process must be maintained throughout the life of that project.

*Table 3 Use of color*

| Color | Used for |
|---|---|
| Red | Critical alerts, emergency information, warnings (fuel, danger areas, conflict alert, compressed gas, locked or guard levers). Use this color sparingly. Refer to Para 2.1 and Fig 7. |
| Yellow | Warnings, cautions and emergency rescue points (emergency controls: yellow used with diagonal black bands) |
| Blue | Reference structure, Navigation and special symbols (associated system colors: Hydraulics, Hydraulic power). Refer to Fig 8. |
| Green | Safe and Exit (associated system colors: Power plant, breathing oxygen) |
| Orange | Warnings and danger areas (associated system colors: Pneumatics, Electrical and lubrication) |
| Amber | Flight control warning. Caution for heavy, hot, fragile items and tools. Amber is used to indicate tools that must be removed before returning to service (associated system colors: Electrical power). Refer to Fig 7. |
| Cyan | Hidden lines (associated system colors: Flight controls) |
| Magenta | Highlighting parts, zones on the main locator view and frames sections. Magenta is used to highlight parts or zones on the main locator view. It is applied as line art, outlining the subject item(s) using a 0,50 mm line weight. It is used only on the initial locator view as a starting point for subsequent navigation through a figure and frames sections (associated system colors: Oxygen). Refer to Fig 9. |
| Light blue | It is used for all detail items and attaching parts and is applied as a fill to the relevant parts/area and represents the final stage of the navigation process where the part(s) is called out for identification or a removal/installation procedure. Refer to Fig 9. |
| Light yellow | Is used to indicate all reference items and structure, locator views and peripheral information. It is applied as a "fill" to the relevant parts/area and is used to differentiate background information from detail. Refer to Fig 6 and Fig 9. |
| Light grey | Light grey is used to indicate the main subject(s) on the locator view and on any intermediate sub-locator views. It is applied as a "fill" to the relevant parts/area that, combined with the relevant navigation symbols, guides the user to the appropriate detail views. Refer to Fig 6 and Fig 9. |

| Color | Used for |
|---|---|
| Black | In a hierarchal structure, black is used to represent all line art on detail parts and reference items, leader lines, hatching, dimensioning and text. |

### 2.2.3 The use of non-standard colors

The application of non-standard colors is still to be used in accordance with the rules given in Para 2.1. Careful consideration must be given to maintaining sufficient color variance between details in multi-colored illustrations, wiring diagrams, maps and flow diagrams requiring an extended range of colors.

## 2.3 Use of photographs

Photographs and photo-realistic computer generated images can be used provided they meet all requirements given in Chap 7.3.2 and the primary illustration rules given in Chap 3.9.2. The following rules also apply:

- Text, annotations and symbology overlaid on photographs are to be kept to a minimum and important consideration is to be given to potential changes.
- If text is required to be in within the photographic image, then it must be placed in a white box and existing illustration rules will apply. Refer to examples in Fig 2.
- Photo manipulation, highlighting and masking to show only the detail required or what is being described to the user can be used. The image must still be prepared with its proportions constrained and present a view and scale that is most favorable for the user. Line illustration and color rules will still apply.
- Hotspots can be used in photographic images to create links used to navigate within technical publications. This area can be activated by hyperlinks, also refer to Chap 3.9.2.2.

For the use of leader lines, refer to Chap 3.9.2.2.

Careful consideration must also be given to the file sizes of photographic images within paper and IETP deliverables. If the final publication, including the photographic images, is to be printed then the original images in question must be saved and stored in accordance with the industry standards. This will then ensure that a quality image is printed and delivered to the customer and will also allow future manipulation and amendments to be easily made.

Photographic images used in the production of an IETP must also be maintained as stated above, however the final delivery to the customer is at screen resolution. For further guidance refer to the examples placed in Fig 2.

### 2.3.1 Embedding of color photographs or color line artwork

The location photograph example image (top left) is 276 kbyte in size and displayed at 72 dots per inch (dpi). Refer to Fig 2. The main image on the page is 546 kbyte at 72 dpi and both images are linked and not embedded in the original file to assist smoother and quicker handling. A design for print A4 version including both images at 300 dpi of Fig 2 has a delivered file size of 20 MByte.

Note: Equipment panel is shown at the correct angle to viewer

# 1 General

This chapter describes the use and production of multimedia objects.

# 2 Multimedia - Rules and general practices

Multimedia objects and their presentations are used in support of technical textual data. They must be considered secondary and not used in place of verified text. All multimedia insertions must go through the formal S1000D verification process.

## 2.1 Rules and general practices

This chapter is to be used in conjunction with Chap 6.3.1 to build project requirements for the inclusion of multimedia objects in an IETP in accordance with the following principles:

- All multimedia objects must be developed and produced from a validated source of technical information. Individual multimedia objects must be validated before delivery in accordance with the project business rules.
- Multimedia objects must be developed and produced for the chosen project viewer or display platforms used.
- Requirements for media element support, ie plug-ins and viewers, must be defined in the project specific rules for non-textual data.
- Original material must be maintained in its native form for reusability.
- It is recommended that all multimedia objects obey the color conventions in accordance with Chap 3.9.2.3 and the rules described in Para 2.10. It is also recommended that consistency in the use of color be applied across a project.
- An indication that the media is loading and its progress must be visible to the user.
- It is recommended that all multimedia objects are built in individual parts. A portion of a media object that carries out a specific function, eg sounds, images, action codes or video sections, can be used alone or combined with the other parts.

- It is recommended that embedded multimedia objects be designed to display within the main content area as described in Chap 6.3.1. This chapter must be applied to standalone full screen media objects also.

## 2.2 Types of media

The range of media types considered suitable for incorporation into IETP systems includes the following:

- audio
- video
- animation
- 3D modeling

### 2.2.1 Audio - Definition

Audio can be a sound track, audible effect or a pure narrative heard to support, or warn, clarify a procedure or diagnosis steps and actions. All three of these audio objects can be embedded or linked externally with displayed media.

The recommended use of audio:

- natural sounds to clarify the result of actions
- audio that will enhance video, adding information required in performing the displayed actions
- user controlled audio narration from validated technical documentation to enhance user understanding
- aural warnings and audible alarms heard such as, on the flight deck or procedural queue to an action

## 2.3 Video - Definition

The term video in this case means real life moving images of equipment actions, procedural steps or a captured live event. These clips can include audio narration or a sound track. It is recommended that video objects are linked but not embedded within other media objects.

The recommended use of video:

- real images to clarify a complex or rarely required maintenance procedure
- demonstrations
- embedded training
- presentations

### 2.3.1 Interactive or scripted animation - Definition

Animation is the creation of moving 2D or 3D non-dynamic images.

The recommended use of animation:

- the movement of original images to clarify a complex disassembly or assembly procedure
- the illustration of equipment movement and linkage or electrical and liquid flow processes
- demonstration of the principles of science and the states of transition
- assisted equipment or system navigation using multiple objects or active areas
- the illustration of change over timeline
- the movement around or positioning of equipment with hidden or difficult component views

### 2.3.2 Simulation - Definition

Simulation is of a mechanical or software system through a pre-defined path, mimicking both user interaction and response.

## 2.4 Production of audio

The following rules and techniques are for the production of sound tracks, audible effects and audio narration.

The following basic set of rules is common for all three cases but specific rules apply.

- International copyright and intellectual property laws must not be infringed on sound tracks or audio effects, or use copyright free where possible
- Users must be made aware that audible warnings are contained within media projects
- Single audio tracks or multi tracked sounds must be preserved in their native form and remain separated from visual media
- Master recordings must be managed in accordance with Para 2.4.2.
- Media projects must determine whether a sound is internally placed or linked for final delivery. It is recommended that small audio files frequently recurring are handled internally, example beeps or clicks; larger sound tracks or short voice instructions are linked and placed externally. Each method has advantages for different situations and requires testing before the final build and delivery.
- All voice-overs and emulated warnings must maintain accurate diction and natural recognition during loading and streaming. Voice processing must be avoided.
- It is recommended that Simplified Technical English® (ASD-STE100) is used for all narrations or the appropriate technical language.
- Slang must not be used and strong dialects are to be avoided.
- Audio synchronizing with visual media must be automatic with cue points embedded corresponding with text or action being displayed.
- Audio production and technical capture settings must be noted and documented.
- The higher the sample rate of audio the better the quality, lower audio data noise. Audio objects must be produced in accordance with the multimedia example set.

### 2.4.1 Audio capture - Two channel or stereo

All recording must be made taking the modulation up to as near the operating level as possible, ie zero = 0 dB (digital system) or zero volume unit meter, 100 % (on combined or analogue systems). This will avoid clipping/distortion eg sound too quiet or too loud.

Peak Program Meter (PPM) can be set for a particular arrangement, but must reflect a fully modulated recording, ie modulation taken up to the full operating level of the sound equipment.

- Audio master voice recording must be recorded in an acoustically inert environment which causes little or no coloration to the narrator’s voice and is sound proofed against extraneous noise.
- Steps must be taken to ensure sound purity, by using an appropriate microphone to suit the narrator’s voice. It is vital that these constants are adhered to, so that retakes recorded at a later date will seamlessly match the Master Recording (MR).
- Audio mastering minimum standard (origination) to be compatible with video standards or audio for CD disc. For video this must be recorded on a system (capture) capable of a sample rate of 48 kHz at 16 Bit (dual channel).
- Mastering for CD music disc only must be carried out on a system recording at 44 kHz at 16 bit CD audio encoding file.
- Care must be taken at post production stage when using both audio and video within the same project. Different embedded sampling rates may not be compatible within certain applications.
- Changing from one sample rate to another is to be avoided as this needs to be carried out via a process that will anti-alias the sound, changing file formats causes problems of subtle distortion.
- It is recommended that all stages of the electronic equipment chain and media do not introduce more than 0.1 % total harmonic distortion, collectively.

### 2.4.2 Subsequent audio

All subsequent audio editing or processing must be carried out on the system that preserves the quality set by the MR with a Production Master (PM) being produced at the same quality as the master.

Audio MR editing objects for short voice instructions must be prepared according to the rules and to the multimedia example set.

Archiving of MR and publication module must be maintained and it is recommended that compression is applied to a copy of the publication module in accordance with the requirements of the project.

Short audio compressed objects for short voice instructions must be prepared according to the rules and to the multimedia example set.

Minimum compression, rate with the appropriate encoding/codec for narrowband or broadband audio material, must be used to maintain accurate diction and natural sound recognition. It is recommended that a free or an open source codec is used.

### 2.4.3 Low bandwidth network

For minimum and maximum streaming bit rates for audio files hosted on a network, the following restrictions are recommended (kbps = kilobits per second):

- on-demand files over a low bandwidth network (56 kbps down to 28 kbps)
- maximum recommended bit rate is 44 kbps
- minimum bit rate of 8,5 kbps

### 2.4.4 Broad bandwidth network

For minimum streaming bit rates for audio files hosted on a network the following restrictions are recommended:

- on-demand files over a broad bandwidth network (512 kbps to a sustained rate of 256 kbps)
- minimum recommended encoded rate is 64 kbps
- top limits need to be tested with project hardware

### 2.4.5 Control of sound objects

Refer to Para 2.9 for further information.

### 2.4.6 Audio required noise levels

Audio levels are to be recorded (captured) at the maximum levels possible without being over recorded (clipping). It is recommended to control set levels when recording multi-narrators sessions to stop peak overload on one voice which might result in under recording others.

The maximum system noise within a master recording must be better than -65 dB and a post production master a minimum of -60 dB to reduce "hissing".

Noise reduction system (Dolby) encoded information must not be included in the MR, PR, or any other media.

It is vital that all steps be taken to limit voice "essing" and transient noises (door bang) to have as "soft an edge" as possible so that quantization noise is not a factor when subsequent compression is applied, as this will result in distortion.

It is also important to minimize room acoustic from being recorded by using "close micing" techniques, when not using sound booths, but by using this technique all "wind pop" must be eliminated. "Close proximity bass effect" must be controlled, typically 12 dB/octave roll off at 80 Hz on the microphone or at the recording chain input.

All steps must be taken to minimize "noises off", background sounds on location, thus saving corrective editing.

General sound coloration must be controlled, eg no sound like "it's coming up a drain". The use of lip microphones is only permitted in high ambient conditions and where it is part of the production.

## 2.5 Production of video

The following rules and techniques are for the production of video objects which also can include narration and or sound tracks. The following basic set of rules is common for both cases but specific rules apply.

To be effective, a video object for technical publications is to be produced in accordance with the principles below:

- International copyright and intellectual property laws must not be infringed on sound tracks or audio effects.
- Lighting and picture quality must maintain natural color representation throughout the presentation.
- The use of artificial lighting in the production of video presentations must not, where color is of technical relevance, display incorrectly and its natural appearance must be ensured.
- The location and parts must be clearly identifiable to the user. If required for clarification, a location or positioning video image and/or direction indicators must be used.
- Video images must be prepared to represent the natural view and scale that is realistic to the user. Different angles or cut-away views must be explained to the user.
- Individual video objects must be produced in parallel with textual instruction to complement each other.
- Textual technical data is to be avoided and not embedded in video objects or referenced outside the file.
- Artistic fades, blends or graphical effects must not be used.
- It is recommended that the use of freeze frames or mixing live actions with animated objects within video presentations is limited and only used to add visual clarity and value for the user.
- If suitable, a video object could serve more than one purpose, eg assembly/dismantling.
- Captured images must be stable and free from rapid movements.

### 2.5.1 Video capture

Digital Video (DV) capture devices recording an YCbCr frame Page: 6
(Y is the luma component and Cb and Cr are the blue and red chroma components), based on the IEC 61834 standard providing a data rate of 25 Megabits per second (Mbps), is the recommended minimum standard for capturing and editing digital video. Media projects that require highly detailed images and accurate color representation must use capture devices with three Charged Coupled Devices (3 CCDs) devoted to each of the red, green and blue color spectrums.

It is strongly recommended that a digital uncompressed video source is used and captured at the following rates:

- PAL and SECAM 25 frames a second at 720 x 576 pixels (digital), 4:2:0
- NTSC 29,70 frames a second at 720 x 420 pixels, 4:1:1
- audio to be two channels set to 48 kHz 16 bit and fully modulated
- recording media must have a compression ratio of no greater than 5:1

### 2.5.2 Transition and video effects

Technical clips or training video productions must only use simple cuts, standard fades and basic blend.

### 2.5.3 Low bandwidth network streaming

The following restrictions are recommended for on-demand narrowband video streams:

- maximum bit rate 80 kbps, except for short clips of less than five minutes which can be coded at 128 kbps
- It is recommended that higher bit rates are only used for two minutes or less video clips.
- Projects are advised to include a 34 kbps stream as a minimum, and can include others up to the maximum bit rate if multi-bit rate streaming is used. The maximum bit rate must not be exceeded.
- It is recommended that the audio parts of video streams are in mono.

### 2.5.4 Broad bandwidth network streaming

The maximum bit rate for broadband video content is 256 kbps. It is recommended that this maximum is not exceeded. Projects are advised to use the option in their production software which gives a rate of 225 kbps stream (usually the "256 kbps connection" option).

Video with sound, of the total bit rate of the video stream, projects are advised to allocate 32 kbps or 64 kbps to audio. It is recommended that speech and music are in mono unless projects specifically need stereo. The reason is that stereo information is mostly contained in the higher frequencies, which are harder to encode, resulting in imperfect stereo.

### 2.5.5 Video picture output

A digital platform is recommended for the production master output, MiniDV - MPEG-2 MP@ML profile as minimum is required. Once mastered, a copy of the video can be compressed to the customer requirement, hence made ready for the appropriate network.

The following video output sizes are recommended:

- low bandwidth network video output be generated at 320 x 240 pixels
- broad bandwidth network video output be generated at 640 x 480 pixels
- individual file sizes do not exceed four Megabytes (Mbyte) for low band networks and 16 Mbyte for broad bandwidth networks.
- individual video objects, steps or scenes do not exceed two minutes

It is recommended that all outputs be set to a variable bit rate and tailored to project delivery.

### 2.5.6 Control of video objects

User control of interactive video objects can be achieved using the agreed media player or interface specified in the project configuration file.

## 2.6 Production of animation

The following rules and techniques are for the production of animated objects. Animation is the S1000D preferred option to deliver an extended range of multimedia objects to the user.

To be effective, animation for technical publications is to be produced in accordance with the recommended principles below:

- All animated illustrations must be taken from original validated source material.
- Animated 2D and 3D technical non-dynamic images, where appropriate, must comply with Chap 3.9.2.
- Color illustrated animated assembly sequences must comply with color convention and Para 2.10.1.
- During animated sequences callouts must remain static.
- All scripting or action codes must be embedded and named at root level.
- Common project symbols, buttons, transitions and action scripts must be maintained in layers and stored in module form for project reusability.
- Asset libraries must be used to assist global changes or updates.
- Large multimedia objects eg video, sounds or raster images must not be embedded.

- Shared object libraries are to be used.
- Textual objects must be 12 pt and fonts embedded for better anti-aliasing.

### 2.6.1 Interactive animation

User control of interactive animation objects can be achieved using the agreed media player or interface specified in the project business rules.

Animated objects must be prepared according to the rules and the multimedia example set.

## 2.7 Simulation of user equipment

The following rules and techniques are for the production of simulation objects. These objects are the visualization and interactive emulation of user equipment using pre-determined or interactive illustrations or animations. The following applies:

- Equipment visualization must be an accurate representation of user equipment.
- Views and scale must be typical and natural.
- Interactive actions and operation sequences must be logical and accurate.
- Audio objects used for simulation must be produced in accordance with Para 2.4.
- Must correctly mimic the operational equipment.

## 2.8 3D modeling

Three-dimensional (3D) digital models that present the user full 3D views of the data. 3D can also include animation, either interactive or scripted.

3D visualization gives the user a full 3-axis view of the scene and it is possible to orient the view such that the maintainer's viewpoint is accurate and true to life.

Scripted animation in 3D can give an accurate picture of disassembly/assembly procedures. Maintenance procedures can be validated using 3D visualization

User control of interactive 3D objects can be achieved using the agreed media player or interface specified in the project business rules.

3D objects must be prepared according to the rules and the multimedia example set.

## 2.9 Introduction and content - Standalone media

Introductory details - CD and DVD labels must conform to distribution media labeling standards.

Media labeling must be produced in accordance with the following principles:

- must include a title, conventional naming, contact, authority, security caveat, expires date stamped
- warning regarding the time dated and validation of the information
- an introductory page to contain a description of the content
- user notes must have minimum machine specification including any special plug-ins or enabling features required to view the contained data. (DVD or CD package must have text only file with package asset lists for data module)
- the table of contents contains hypertext links to all references
- permissions and releases for persons presented in media productions are accomplished in accordance with the applicable laws of the country or states in which the media was developed
- reusable objects be defined with tailored metadata
- the use of metadata is an important part of the content production process and must comply with the project business rules

## 2.10 Creation principles (user interface) - General

This section governs only the media displayed within the main window area, or a standalone media object that is displayed full screen as described in Chap 6.3.1 within an IETP.

### 2.10.1 User interface visual structure "look and feel"

The following rules and techniques are for the production of a user interface. This must be produced in accordance with Chap 6.3.1 or have the following below:

- OK or start buttons as required
- use standard objects and icons
- clear start or user launched point for all media objects
- control within the media window or by external means
- set screen sizes or frame sizes throughout the project
- navigational information must be standardized, eg same order, same position throughout project
- layout and structures must be consistent, eg in order of the basic functions or maintenance task (with no buttons)
- buttons must be consistent and with an alternative text tag
- textual information or lettering must be minimum of 12 pt and in accordance with Chap 3.9.2.1
- images have descriptive alternative text (eg ALT tags in web deliverables)
- use color and backgrounds in accordance with Chap 3.9.2.3
- exit button or stop, pause button as required

### 2.10.2 Production guidelines

These guidelines will assist the multimedia designer to maintain a consistent user interface for data presentation. It is recommended that the designer adopt the following techniques:

- automatic definition of the size and position of the windows
- use of a symbolic map to show "where you are" and the route taken
- provision of pictorial access (a graphical menu) to the Product system structure and data
- ensure consistency in the use
- establish a consistent substructure or series of templates
- appropriate user interfaces and skill levels for users with creditable use cases and scenarios

### 2.10.3 Basic navigation functions

All multimedia must incorporate methods of navigation. Though the nature and content of each application will dictate the navigation features provided, the basic (minimum) navigation functions are:

- Frame forward/backward
- Start/Stop and Pause
- Home, Quit or Exit and Menu
- Volume controls - On /Off

### 2.10.4 Warnings and cautions

The presentation of warnings and cautions must conform to the general requirements as given in Chap 6.2 and Chap 6.3.1.

## 2.11 Use of color in multimedia

These rules and techniques are for the use of color in all visual multimedia objects. The following applies:

- In the production of color or black and white animated 2D illustrations, color must be applied in accordance with Chap 3.9.2.3.

- For video and realistic images of equipment or parts the color rules generally will not apply, however, any tool items, highlighting or navigation symbols superimposed must be applied in accordance with Chap 3.9.2.3.
- Color used in Digital Mock-Up (DMU) presentations are given in Chap 3.9.2.5.
- A web safe palette will be required if projects consider their work be viewed through an eight bit (256 color) computer system. Refer to Chap 3.9.2.3.
- Color Gamut differences require testing within the project environment.

### 2.11.1 Animated hierarchical structure using color

Animated color 2D illustrations must be prepared according to these rules and the multimedia example set:

- All animations must start with a locator view, indicating the main subject item as a light grey and highlighted with a magenta line, all other reference structure is filled light yellow.
- All navigation symbols must be blue and remain static.
- Black line art with a light blue fill is used to identify detail items and attaching parts for animated removal or installation.
- Black line art with an amber fill will be used to identify animated tool items introduced and that must be removed before returning to service.
- Red must only be used and applied in accordance with Chap 3.9.2.3
- During animated sequences callouts remain static or appear in the last frame.

## 2.12 Use of multimedia for navigation

The following rules and techniques are for the production of hotspots, scripted actions and object behavior within media presentations. This paragraph is to be used in conjunction with Chap 3.9.5.2.1.8, Chap 6.3.1 and Chap 7.3.3 to build project requirements for image or object driven navigation of content or actions within multimedia presentations. Also see examples in the multimedia example set.

### 2.12.1 Use of hotspots

Hotspots, as with graphics, are a sensitive area in a visual presentation necessary for creation of links used to navigate or start other actions. This can happen within a media environment or be used to link out or call upon on another relevant object. This area can be activated by hotspots from:

- text in a data module to one area of media object
- text in a data module to several areas of media object
- one area of media object to the data module text
- one area of media object to another area of the same media object
- one area of media to another area of a media object

The sensitive area can be represented by:

- visible image region (or invisible before a cursor event)
- color objects used in accordance with Chap 3.9.2.3
- blue navigation symbols can include the leader line
- buttons with or without text objects
- callout numbers can include the leader line
- the itemized graphic objects or their surface
- callout numbers including leader lines and itemized graphic objects (or their surface)

Highlighting the sensitive area by touching with the cursor is a viewer or application constraint. This can be handled within the media environment as specified by the project.

To set up links between data module text and multimedia presentations, or between media objects, cross-reference identifiers are necessary. This also applies to defined regions and view

context attributes. The required target address of points and values are handled within the media environment as specified by the project.

### 2.12.2 Scripted actions

Scripted actions add interactivity to multimedia presentations. They are generated and embedded by the production application and used by the specified viewer. The uses of these scripts are essential and control a media object in response to specified user situations or interactive conditions. Scripted actions can generate or control object behavior as described in Para 2.12.3. They must be simple, built in a modular form and tested thoroughly before inclusion.

### 2.12.3 Object behavior

Object behavior is a result of a call from another media object or being directly touched with the cursor. This can visually change the object's appearance in the user view context, animate the object or play other media objects. These types of interactivity or actions can be handled by the application or project specified viewer. The following object behaviors are allowed:

- display a text string, screen tips
- display other menu options as described in Para 2.10.3
- swap image or restore original image
- start and stop object animations
- play audio, beep or start or stop audio files
- control and perform object or media transitions
- using an object as the target of an action
- linking to frames, views or other objects

# 1 General

This chapter frames and describes the initial requirements for the use and production of 3D and full interactive technical content. Multimedia elements and presentations produced in accordance with this chapter could be used in support of or instead of technical textual data and would be verified and used as authoritative alternatives for written data.

# 2 Interactive 3D content

## 2.1 Rules and general practices

This chapter is to be used in conjunction with Chap 3.9.2.4 and Chap 6.3.1 to build project requirements for the inclusion of interactive 3D content in an IETP and in accordance with the principles below.

- All interactive 3D content or technical media must be developed and produced from a validated source of technical information. The production and delivery processes must be validated in accordance with the project rules.
- Interactive 3D content must be developed and produced for the chosen project viewer or display platforms used.

- Requirements for media element support and viewers must be defined in the project specific rules for non-textual data.
- All interactive 3D content must obey color convention in accordance with Chap 3.9.2.3 and the rules described in Para 2.3.1.
- All interactive 3D content or technical media must be produced in accordance with the Multimedia example set.

## 2.2 Types of media

The range of media types considered suitable for incorporation into IETP system includes the following:

- interactive 3D content
- verified interactive technical media

### 2.2.1 Interactive 3D content - Definition

Interactive 3D content is defined as 3D images dynamically generated from engineering models and other production systems with user interaction.

The recommended use of 3D:

- the movement of an original 3D object to clarify a complex disassembly or assembly procedure
- the movement around or positioning of equipment to show hidden or difficult component views

### 2.2.2 Interactive verified technical media - Definition

Interactive verified technical media is the creation or the generations of 3D dynamic images or 3D data that is verified, as authoritative as written textual data and can be visually manipulated.

The recommended use of interactive verified technical media:

- delivery of interactive and dynamically generated visual technical information
- used instead of technical textual data

## 2.3 Production of interactive 3D content

To be effective for technical publications, 3D data must be generated and produced from the original validated engineering models, although it is not required that they be dimensionally accurate. The following rules and recommendations must be used:

- Removed parts must remain in view and be parked in a removed area or bench location to complete the maintenance sequence.
- During animated sequences, visual callouts or navigations symbols must not move but must remain static or appear in the last frame of the sequence to navigate further.
- Animated removal or tool actions must be realistically performed as viewed by the user.
- For animated moving parts or actions that would represent a danger or hazard to the maintainer, warnings and cautions must appear, in accordance with Chap 6.3.1 and be acknowledged by the user before proceeding to the next step. Textual data can have also warned the maintainer beforehand.

### 2.3.1 Use of color in interactive 3D content

These rules and techniques are for the production of dynamically generated and interactive 3D color animations. Solid 3D objects and all color applied to their surfaces must be in accordance with following:

- Red must only be used and applied in accordance with Chap 3.9.2.3.
- Animated moving parts that would be a danger or hazard to maintainer must be colored in accordance with Chap 3.9.2.3.

- For realistic rendered surfaces of equipment or parts, the color rules generally will not apply, however, any tools items, highlighting or navigation symbols must be applied in accordance with Chap 3.9.2.3, hierarchical structure rules.
- Introduced 3D tools/heavy objects must have an amber surface.
- Hidden or difficult access components, first must be viewed normally with solid surfaces in the way.
- Hidden objects for removal must appear light blue and, to differentiate, background surface information must be light yellow or realistic colors.
- All color applied to 3D objects must add value to the users visual interpretation.
- Initial locator view or sequences, indicating the main subject items must have a light grey surface and any brief highlighting for the viewer must have a magenta surface.
- All navigation symbols must be blue and remain static.
- Black line art with a light blue fill is can be used to identify detail items and attaching parts for animated removal or installation.

# 1 General

This chapter gives the definitions and rules for warnings, cautions and notes.

## 1.1 Warnings

Warnings are used in data modules and technical publications to alert the user that possible hazard are associated with the materials/processes/procedures/limits. These can cause death or injury in any form, if the instructions in the operational or procedural task are not followed precisely. Warnings describe the hazards and the possible impact.

## 1.2 Cautions

Cautions are used in data modules and technical publications to alert the user that damage to the Product is possible if the instructions in the operational or procedural task are not followed precisely. Cautions describe the hazards and possible impact.

## 1.3 Notes

Notes used in data modules and technical publications provide the user with additional information, which is helpful but does not belong to the immediate subject. Operational and procedural tasks can be made easier by the use of notes, but when used, they do not take the place of operational or procedural information.

## 1.4 Safety conditions

Warnings and cautions that apply to the whole of an instruction must be contained or referenced in the Preliminary requirements - Safety conditions. Refer to Chap 3.9.5.2.1.9.

Warnings must precede cautions and cautions must precede notes.

## 1.5 General warnings and cautions

Warnings and cautions that apply to the Product or part thereof can be captured in descriptive data modules using the information code 012 (General warnings and cautions and related safety data).

## 1.6 Presentation

Examples of the presentation of warning, caution and notes are given in Chap 6.2.2.

# 2 Content

Warning and cautions can be located:

- in one or more separate descriptive data modules using the information code 012 in the data module code. Refer to Para 1.5.
- in Preliminary requirements (element <preliminaryRqmts>) - Safety conditions (element <reqSafety>) of a procedural data module. Refer to Para 1.4.
- within operational and maintenance procedures, at the element level of a data module. Warnings and cautions are to be placed directly preceding the paragraph to which they pertain.
- in a collection (element <warningsAndCautions>). Refer to Para 2.4

Notes can be placed either before or after the paragraph to which they pertain or in the Preliminary requirements - Safety conditions of a procedural data module. Refer to Para 1.4.

## 2.1 Warnings

**Description:** The element <warning> is used to contain hazard information that can cause personal injury or death.

Warnings in data modules must always precede the text where the hazard arises (for details see below) and must always precede cautions and notes.

Warnings of a general nature which are applicable throughout a procedure can precede the instruction to save repeating the warning before each of the individual steps of the maintenance task where the hazard arises. Refer to Para 2.1.2.

The caption **WARNING** must begin the warning followed by symbols, if any. Refer to Chap 6.2.2 for examples.

**Note**

The caption WARNING is not entered in the data modules when data modules are written in an XML editor or a What You See Is What You Get (WYSIWYG)-editor with an automatic function for presentation of legends. If not, the author must make sure that the caption is included.

Warnings must not be numbered. Warnings must be the first item within that step/para.

**Note**

There are two methods to present the Warnings, refer to Chap 6.2.2.

**Note**

Warnings must not be used in purely descriptive information (ie data modules with information code 040, 041 etc.). This does not prohibit the use of warnings in the descriptive data module for the production of content such as a summary of warnings.

The following applicability rule must be followed:

- Warnings that pertain to parent elements are also applicable to all of its child elements.

**Markup element:** <warning> (O)

ICN-S3627-S1000D0524-001-01

*Fig 1 Element <warning> and element <caution>*

**Attributes:**

- `applicRefId` (O), `which` contains applicability information. Refer to Chap 3.9.5.3
- `id` (O), the identifier for the warning element. Refer to Chap 3.9.5.2.1.2.
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1
- `warningType` (O), describes the type of warning
- `internalRefId` (O), to facilitate the (ID/IDREF) linking mechanism. Refer to Chap 3.9.5.2.1.2
- `vitalWarningFlag` (O), indicates whether the warning is vital or not. This attribute can have the following values:
  - "`0`" - a **non-vital** warning
  - "`1`" - a **vital** warning

  **Note**

  It is not recommended to use the attribute `vitalWarningFlag` as it gives a classification to the warnings and thus can interfere with country legislations and rules.

- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11
- `securityClassification` (O), `commercialClassification` (O) and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6

**Child elements:**

- <`symbol`> (O). Refer to Chap 3.9.5.2.1.10
- <`warningAndCautionPara`> (M). Refer to Para 2.1.2

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of the attribute `vitalWarningFlag`
- use of the attribute `warningType`
- general warnings as individual data modules
- use of the collection of warnings

**Markup example:**

```
<warning>
<warningAndCautionPara>Do not ride with a cracked
stem.</warningAndCautionPara>
</warning>
```

### 2.1.1 Symbol

The element <`symbol`> must be populated in accordance with Chap 3.9.5.2.1.10.

Warnings and cautions can be emphasized with one or more symbols using the element <`symbol`>. It is recommended to use International Standards Organisation (ISO) standards.

### 2.1.2 Warning and caution para

**Description:** The element <`warningAndCautionPara`> contains the warning or caution text.

**Markup element:** <`warningAndCautionPara>` (M)

ICN-S3627-S1000D0525-001-01

*Fig 2 Element <`warningAndCautionPara`>*

**Attributes:**

- `applicRefId` (O), `which` contains applicability information. Refer to Chap 3.9.5.3
- `id` (O), the identifier for the warning and caution paragraph element. Refer to Chap 3.9.5.2.1.2.

  **Note**

  The attribute `id` is required when authoring a warning and caution collection. Refer to Para 2.4

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11
- `securityClassification` (O), `commercialClassification` (O) and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6

**Child elements:**

- Includes the child elements of the `attentionText` group applicable for the actual data module type. Refer to Para 2.1.2.1.

and

– <attentionListItem> (O). Refer to Para 2.1.2.2

**Business rules decisions:**

– None identified

**Markup example:**

```
<warningAndCautionPara>If you operate the front brake without
the rear brake you can cause a crash.</warningAndCautionPara>
```

2.1.2.1 The attentionText group

The content of the attentionText group varies depending on data module type but the name of the group is still the same for all data module types. The full (maximum) content of the attentionText group is shown in Fig 3.

ICN-S3627-S1000D0545-001-01

*Fig 3 The `attentionText` group*

The content of the three different warning/caution/note paragraph types are detailed in Fig 4. The figure provides the element name, which data module types the element is available in and which subelements are available in that context.

The description of the content of the subelements is given in Chap 3.9.5.2.1.10.

| Element [group] | Data module type in which the element occurs | Available subelements (grey indicates available) | | | | | | | | | | | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | functionalItemRef | circuitBreakerRef | controlIndicatorRef | inlineSignificantData | quantity | zoneRef | accessPointRef | identNumber | internalRef | indexFlag | changeInline | emphasis | symbol | subScript | superScript | dmRef | pmRef | externalPubRef | footnote | footnoteRef | acronym | acronymTerm | captionGroup | caption | verbatimText |
| <warningAndCautionPara> [attentionText] | checkList<br>crew<br>descript<br>learning | | | | | | | | | | | | | | | | | | | | | | | | | | |
| <warningAndCautionPara> [attentionText] | fault<br>proced<br>process<br>schedul | | | | | | | | | | | | | | | | | | | | | | | | | | |
| <attentionListItemPara> [attentionText] | checkList<br>crew<br>descript<br>learning | | | | | | | | | | | | | | | | | | | | | | | | | | |
| <attentionListItemPara> [attentionText] | fault<br>proced<br>process<br>schedul | | | | | | | | | | | | | | | | | | | | | | | | | | |
| <notePara> [attentionText] | checkList<br>crew<br>descript<br>learning | | | | | | | | | | | | | | | | | | | | | | | | | | |
| <notePara> [attentionText] | fault<br>proced<br>process<br>techrep | | | | | | | | | | | | | | | | | | | | | | | | | | |
| <notePara> [attentionText] | schedul | | | | | | | | | | | | | | | | | | | | | | | | | | |

ICN-S3627-S1000D0546-001-01

*Fig 4 Paragraph models and available subelements*

2.1.2.2 Attention random list

**Description:** The element <`attentionRandomList`> contains the list items.

When used in warnings and cautions, this element mirrors the element <`randomList`> with the exception that the following content is not available:

- sequential list
- definition list
- note
- index flag
- footnote
- footnote reference
- caption group

When used in notes, this element mirrors the element <`randomList`> with the exception that the following content is not available:

- definition list
- note
- index flag
- footnote
- footnote reference
- caption group

There are two types of attention random lists:

- simple - recognized by the value "`pf01`" of the attribute `prefix` giving just an indented item without a prefix

– unordered - the lists recognized by the default value "pf02" of the attribute prefix giving the following default sequence of prefix: [-][●][-]

The difference between a simple random list and an unordered random list is in the presentation. Refer to Chap 6.2.2.

Attention random lists do not allow titles, nor can they be nested.

Only one level of attention random lists is allowed.

**Markup element:** <attentionRandomList> (O)

**Attributes:**

– applicRefId (O), which contains applicability information. Refer to Chap 3.9.5.3.
– id (O), the identifier of the attention random list element. Refer to Chap 3.9.5.2.1.2.
– changeType (O), changeMark (O) and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1
– listItemPrefix (O), this element is used to indicate whether the list is a simple list or an unordered random list. This attribute can have the following values:
  - "pf01" - "pf99" where "pf02" is the default value. Refer to Chap 3.9.6.1.
– authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11
– securityClassification (O), commercialClassification (O) and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6

**Child elements:**

– <attentionRandomListItem> (M). Refer to Para 2.1.2.2.1.

**Business rules decisions:**

– None identified

**Markup example:**

```
<attentionRandomList>
<attentionRandomListItem>…</attentionRandomListItem>
</attentionRandomList>
```

2.1.2.2.1 *Attention random list item*

**Description:** The element <attentionRandomListItem> contains one list item for attention random lists.

Each list item can consist of one or more paragraphs.

**Note**

To enable more than one paragraph, the Schema allows a list item to contain one or more paragraphs. Use the element <attentionListItemPara> if your list item has more than one paragraph.

**Markup element:** <attentionRandomListItem> (M)

**Attributes:**

– applicRefId (O), which contains applicability information. Refer to Chap 3.9.5.3
– id (O), the identifier of the attention random list item element. Refer to Chap 3.9.5.2.1.2.

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1
- securityClassification (O), commercialClassification (O) and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6

**Child elements:**

- <attentionListItemPara> (O). Refer to Para 2.1.2.2.2.

**Business rules decisions:**

- None identified

**Markup example:**

```
<attentionRandomListItem>...</attentionRandomListItem>
```

*2.1.2.2.2 Attention list item para*

**Description:** The element <attentionListItemPara> contains the list items paragraphs when one or more list item paragraphs are needed.

**Markup element:** <attentionListItemPara> (O)

**Attributes:**

- applicRefId (O), which contains applicability information. Refer to Chap 3.9.5.3
- id (O), the identifier of the attention list item para element. Refer to Chap 3.9.5.2.1.2.
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11
- securityClassification (O), commercialClassification (O) and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6

**Child elements:**

- Includes the child elements of the attentionText group applicable for the actual data module type. Refer to Para 2.1.2.1.

**Business rules decisions:**

- None identified

**Markup example:**

```
<attentionListItemPara>...</attentionListItemPara>
```

## 2.2 Cautions

**Description:** The element <caution> contains hazard information that can cause damage to the Product.

Cautions in data modules must always precede the text where the hazard arises (for details see below) and must always precede notes.

Cautions of a general nature, however, which are applicable throughout an instruction, can precede the instruction to save repeating the caution before each of the individual steps of the maintenance task where the hazard arises. Refer to Para 2.1.2.

The caption **CAUTION** must begin the caution followed by symbols, if any. Refer to Chap 6.2.2 for examples.

**Note**

The caption CAUTION is not entered in the data modules when data modules are written in an XML editor or a WYSIWYG-editor with an automatic function for presentation of legends. If not, the author must make sure that the caption is included.

Cautions must not be numbered. Cautions must be the first item within that step/para.

The scope of cautions follows the same rules as for warnings. Refer to Para 2.1.

**Note**

There are two methods to present the Cautions, see Chap 6.2.2.

**Note**

Cautions must not be used for purely descriptive information (ie data modules with information code 040, 041 etc.). This does not prohibit the use of cautions in the descriptive data module for the production of content such as a summary of warnings.

The content of the element <`caution`> is given by a combination of the same subelements and attributes as used by element <`warning`> except for the absence of the attribute `vitalWarningFlag`. Refer to Para 2.1.

**Markup element:** <`caution`> (O)

**Attributes:**

- `applicRefId` (O), `which` contains applicability information. Refer to Chap 3.9.5.3
- `id` (O), the identifier for the caution element. Refer to Chap 3.9.5.2.1.2.

  **Note**

  The attribute `id` is required when authoring a warning and caution collection. Refer to Para 2.4.

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1
- `cautionType` (O), describes the type of caution
- `internalRefId` (O), to facilitate the ID/IDREF linking mechanism. Refer to Chap 3.9.5.2.1.2
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11
- `securityClassification` (O), `commercialClassification` (O) and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6

**Child elements:**

- <`symbol`> (O). Refer to Chap 3.9.5.2.1.10.
- <`warningAndCautionPara`> (M). Refer to Para 2.1.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of the attribute `cautionType`
- general cautions as individual data modules
- use of the collection of cautions

**Markup example:**

```
<caution>
<warningAndCautionPara>Do not use a
<internalRef internalRefId="seq-0001"
internalRefTargetType="supequip"></internalRef>
 that has high pressure. A water hose that has high pressure can
cause some parts to become loose or full of
water.</warningAndCautionPara>
</caution>
```

## 2.3 Notes

**Description:** The element <note> contains additional information that can be useful to the user.

Normally, notes in data modules must follow the text to which they refer. In certain circumstances, it can be necessary to allow for notes to precede the text to which they refer. In this case, projects must declare the use of notes in their business rules.

Notes must always follow warnings and cautions.

Notes of a general nature, which are applicable throughout procedure, can precede the instruction to save repeating the note throughout the procedure.

The production of notes as individual data modules is not recommended.

The caption **Note** must begin the note. If the notes are numbered then the caption **Note X** must begin the note. Refer to examples in Chap 6.2.2.

**Note**

The caption **Note** is not entered in the data modules when data modules are written in an XML editor or a WYSIWYG-editor with an automatic function for presentation of legends. If not, the author must make sure that the caption is included.

If there is more than one note they can, by project decision, be numbered to enable cross-references to be made to them within the text.

A note can comprise of one or more paragraphs. It is however recommended to keep the notes as simple as possible.

The use of attention sequential lists and attention random lists are discouraged. Refer to Para 2.3.2 and Para 2.1.2.2.

There can be instances where notes are applicable to complete steps/paras or substeps/subparas, including their substeps/subparas. In those circumstances, notes must be the first item within that step/para. They must follow the step/para number and title, if any, and precede any text.

The scope of notes follows the same rules as for warnings. Refer to Para 2.1.

The content of the element <note> is given by a combination of the same subelements and attributes as used by element <warning> (refer to Para 2.1) except for the absence of the attribute `vitalWarningFlag` and the addition of sequential lists.

**Markup element:** <note> (O)

ICN-S3627-S1000D0547-001-01

*Fig 5 Element <note>*

**Attributes:**

- `applicRefId` (O), which contains applicability information. Refer to Chap 3.9.5.3
- `id` (O), the identifier for the note element. Refer to Chap 3.9.5.2.1.2.
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1
- `noteType` (O), describes the type of note
- `internalRefId` (O), to facilitate the ID/IDREF linking mechanism. Refer to Chap 3.9.5.2.1.2.
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11
- `securityClassification` (O), `commercialClassification` (O) and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6

**Child elements:**

- <`symbol`> (O). Refer to Chap 3.9.5.2.1.10.

and one of the following is required:

- <`notePara`> (C). Refer to Para 2.3.1.
- <`attentionSequentialList`> (C). Refer to Para 2.3.2.
- <`attentionRandomList`> (C). Refer to Para 2.1.2.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of the attribute `noteType`
- general notes as individual data modules

**Markup example:**

```
<note>
<notePara>The stem must point forward in alignment with the
wheel.</notePara>
</note>
```

### 2.3.1 Note para

**Description:** The element <notePara> contains the note text.

**Markup element:** <notePara> (C)

ICN-S3627-S1000D0549-001-01

*Fig 6 Element <note>*

**Attributes:**

– Includes the same set of attributes as the element <attentionListItemPara>. Refer to Para 2.1.2.2.2.

**Child elements:**

– Includes the child elements of the attentionText group applicable for the actual data module type. Refer to Para 2.1.2.1.

and

– <attentionSequentialList> (O). Refer to Para 2.3.2.
– <attentionRandomList> (O). Refer to Para 2.1.2.2.

**Business rules decisions:**

– None identified

**Markup example:**

```
<notePara>It is not necessary to remove the handlebar for this
procedure.</notePara>
```

### 2.3.2 Attention sequential list

**Description:** The element <attentionSequentialList> contains an attention sequential (ordered) list in a note. This element mirrors the element <sequentialList> with the exception that the following content is not available:

– definition list
– note
– index flag
– footnote
– footnote reference
– caption group

An attention sequential list, when formatted, has numbers before the list items. Refer to Chap 6.2.2.

In the attention sequential list, a list item can consist of one or more paragraphs.

A sequential list, when formatted, is numbered with Arabic numerals. Refer to Chap 6.2.2.

Attention sequential lists are limited to a maximum of two levels.

**Markup element:** <`attentionSequentialList`> (C)

ICN-S3627-S1000D0548-001-01

*Fig 7 Element <`attentionSequentialList`>*

**Attributes:**

– Includes the same set of attributes as the element <`attentionListItemPara`>. Refer to Para 2.1.2.2.2.

**Child elements:**

– <`title`> (O). Refer to Chap 3.9.5.2.1.5
– <`attentionSequentialListItem`> (M). Refer to Para 2.3.2.1.

**Business rules decisions:**

– None identified

**Markup example:**

```
<attentionSequentialList>
<attentionSequentialListItem>...</attentionSequentialListItem>
</attentionSequentialList>
```

2.3.2.1 Attention sequential list item

**Description:** The element <`attentionSequentialListItem`> contains list items and can consist of one or more paragraphs.

**Markup element:** <`attentionSequentialListItem`> (M)

**Attributes:**

– Includes the same set of attributes as the element <`attentionListItemPara`>. Refer to Para 2.1.2.2.2.

**Child elements:**

– <`attentionListItemPara`> (O). Refer to Para 2.1.2.2.2.
– <`attentionRandomList`> (O). Refer to Para 2.1.2.2.

**Business rules decisions:**

– None identified

**Markup example:**

```
<attentionSequentialListItem>...</attentionSequentialListItem>
```

## 2.4 Warnings and cautions collection

**Description:** The element <warningsAndCautions> contains the collection of warnings and cautions used within a data module. Each warning or caution is authored separately within the element <warningsAndCautions>. Warnings and cautions can be authored once in a data module and then referenced as needed.

The collection (element <warningsAndCautions>) must not include warnings or cautions that are unused within the data module.

**Note**

The collection can be used in combination with warnings and cautions authored at the element level of a data module. The collection is useful for holding common (or multi-use) alerts while local (or single-use) alerts can be authored as needed.

The warnings and cautions collection is referenced by the use of the attribute warningRefs or the attribute cautionRefs and is allowed on the following elements:

– <crewDrill>. Refer to Chap 3.9.5.2.6.
– <crewDrillStep>. Refer to Chap 3.9.5.2.6.
– <crewRefCard>. Refer to Chap 3.9.5.2.6.
– <descrCrew>. Refer to Chap 3.9.5.2.6.
– <description>. Refer to Chap 3.9.5.2.2.
– <entry>. Refer to Chap 3.9.5.2.1.6.
– <isolationProcedureEnd>. Refer to Chap 3.9.5.2.4.
– <isolationStep>. Refer to Chap 3.9.5.2.4.
– <levelledPara>. Refer to Chap 3.9.5.2.2.
– <proceduralStep>. Refer to Chap 3.9.5.2.3.
– <safetyRqmts>. Refer to Chap 3.9.5.2.1.9.

The attribute warningRefs is populated with the identification (attribute id) assigned to the applicable warning within the collection (element <warningsAndCautions>).

The attribute cautionRefs is populated with the identification (attribute id) assigned to the applicable caution within the collection (element <warningsAndCautions>).

ICN-S3627-S1000D0550-001-01

*Fig 8 Element <warningsAndCautions>*

**Markup element:** <warningsAndCautions> (O)

**Attributes:**

- id (O), the identifier of the warnings and cautions collections element. Refer to Chap 3.9.5.2.1.2.
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11
- securityClassification (O), commercialClassification (O) and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6

**Child elements:**

- <warning> (C), the attribute id must be used when authored within the collection. Refer to Para 2.1.
- <caution> (C), the attribute id must be used when authored within the collection. Refer to Para 2.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of warning and caution collection

**Markup example:**

```
<warningsAndCautions>
<warning id="warn-0001">
<warningAndCautionPara>The 1st warning in the warnings and
cautions collection, used multiple times within the
DM.</warningAndCautionPara>
</warning>
<warning id="warn-0002">
<warningAndCautionPara>The 2nd warning in the warnings and
cautions collection, used multiple times within the
```

```
DM.</warningAndCautionPara>
</warning>
<caution id="caut-0001">
<warningAndCautionPara>The 1st caution in the warnings and
cautions collection, used multiple times within the
DM.</warningAndCautionPara>
</caution>
</warningsAndCautions>
...
<reqSafety>
<safetyRqmts warningRefs="warn-0001" cautionRefs="caut-0001">
<warning>
<warningAndCautionPara>Some other warning, not included in the
collection.</warningAndCautionPara>
</warning>
</safetyRqmts>
</reqSafety>
...
<table>
<tgroup cols="2">

<row>
<entry warningRefs="warn-0001 warn-0002" cautionRefs="caut-
0001"></entry>
<entry>
<caution>
<warningAndCautionPara>A caution used one-time only and authored
in the applicable table entry.</warningAndCautionPara>
</caution>
</entry>
</row>
</tbody>
</tgroup>
</table>
```

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use of attribute `vitalWarningFlag`.** The project or the organization must decide if and how the attribute `vitalWarningFlag` will be used. Refer to Para 2.1.

**Use of attribute `warningType`.** The project or the organization must decide whether to use the attribute `warningType` or not. Refer to Para 2.1.

**General warnings as individual data modules.** The project or the organization must decide whether to produce general warnings as individual descriptive data modules or not (IC 012). Refer to Para 2.1.

**Use of the collection of warnings.** The project or organization must decide whether to produce warnings in a collection or not. If used, the attribute `id` must be included for warnings within the collection. Refer to Para 2.4.

**Use of attribute `cautionType`.** The project or the organization must decide whether to use the attribute `cautionType` or not. Refer to Para 2.2.

**General cautions as individual data modules.** The project or the organization must decide whether to produce cautions as individual descriptive data modules or not (IC 012). Refer to Para 2.2.

**Use of the collection of cautions.** The project or organization must decide whether to produce cautions in a collection or not. If used, the attribute `id` must be included for cautions within the collection. Refer to Para 2.4.

**Use of attribute `noteType`.** The project or the organization must decide whether to use the attribute `noteType` or not. Refer to Para 2.3.

**General notes as individual data modules.** The project or the organization must decide whether to produce notes as individual descriptive data modules or not (IC 012). Refer to Para 2.3.

| Chap 6.2.3.1 | Layout - Description - Rules and examples |

# 1 General

This chapter gives guidance on authoring front matter in a data module environment. Note that authoring front matter in a data module environment is fundamentally different from traditional processes in that the author is actually populating data modules, sometimes in a random manner, rather than writing a publication in a sequential manner.

Each publication or volume thereof must have a set of front matter as given in Chap 5.3.1.1.

Examples for page-oriented front matter are given in Chap 6.2.3.1 if not otherwise stated.

Issue number and date must be the same for the publication and all new or re-issued front matter data modules.

# 2 Front matter

## 2.1 Title page

The title page contains, if applicable, the following information:

- Product/project and country (O). This information has to be agreed between the publication producer and the customer.
- publication/volume title (M)
- publication module code (M)
- page identification = data module code (M)
- issue number of the publication (M)
- project's logotype (O)
- data restrictions (C)
- publishing authority (M)
- manufacturer's information (M)

Issue date of the publication (issue date of the title page data module) and security markings follow the rules for page layout. Refer to Chap 6.2.1.

The security marking must represent the highest classified information in the publication or volume.

The title page must be reissued with each issue.

## 2.2 List of effective pages

### 2.2.1 Definition

The List of Effective Pages (LOEP), if used, must identify each page in the page-oriented publication contents by giving:

- data module code
- page number
- issue date
- applicability

All new (additional) or changed pages must be marked with:

- N = New page
- C = Changed page

where:

"N" indicates a new page. This means that this page is an additional page compared with the last issue of the publication.

"C" indicates a changed page. This means that this page has some form of technical or editorial (including layout and new date) change compared with the last issue of the publication.

The LOEP must present the issue number and date of the actual publication.

If a project decides to use LOEP instead of List of Effective Data Modules (LOEDM), the LOEP must be reissued with each issue of the publication.

### 2.2.2 Project specific decisions

The project must decide on the use of LOEP in place of LOEDM.

## 2.3 List of effective data modules

### 2.3.1 Definition

The LOEDM lists all data module of the publication by giving:

- data module title (<techName> - <infoName>)
- data module code
- issue date
- number of pages (O)
- applicability

All new (additional) or changed data modules must be marked with:

- N = New data module
- C = Changed or revised data module

"N" indicates a new data module. This means that this data module is an additional data module compared with the last issue of the publication.

"C" indicates a changed or revised data module. This means that this data module has some form of technical or editorial (including layout and new date) change compared with the last issue of the publication.

**Note**

N and C are to be considered from a publication issue view.

The LOEDM must present the issue number and date of the actual publication.

The LOEDM must be reissued with each issue. By project decision the LOEDM can be replaced by an LOEP.

## 2.4 Change record

The change record is intended to provide a continuing record of the state of each individual copy of the publication. The change record must only be reissued when all of the initial change record predefined issues are filled in.

## 2.5 Highlights

### 2.5.1 General

The highlights give the reasons for the changes of the data modules/illustrations in each issue, using the optional elements <reasonForUpdate> and/or <reasonForAmendment>. The highlights must give:

- data module code
- reason for change

The highlights must not list the changes in:

- Title page
- List of effective pages
- List of effective data modules
- Change record
- Table of contents

The highlights data module must present the issue number and date of the actual publication.

The highlights must be issued with each issue of the publication or volume. Highlights must not be used in IPD.

### 2.5.2 Paper distributed publications

A variant of a highlight data module is an "extended" highlight data module for paper publications. This variant includes instructions for the updating of the publication. In addition to the list of highlights, refer to Para 2.5.1, a table giving the following information must be added:

- data module code
- data module title (<techName> - <infoName>)
- issue date
- number of pages (O)
- applicability

All data modules which are removed from previous issue and to be inserted in the new issue must be marked:

- R = Remove data module
- I = Insert data module

## 2.6 Access illustration

Access illustrations are a set of illustrations that can be included to support the navigation of the publication. Access illustrations are to be used in IETP only.

## 2.7 List of abbreviations

The List of Abbreviations (LOA) lists the non-standard abbreviations used in a publication. An example of a LOA is given in Chap 5.2.1.18.

## 2.8 List of terms

The List of Terms (LOT) lists the non-standard terms used in a publication. An example of a LOT is given in Chap 5.2.1.18.

## 2.9 List of symbols

The List of Symbols (LOS) lists the non-standard symbols used in a publication. An example of a LOS is given in Chap 5.2.1.18.

## 2.10 Technical standard record

Incorporated technical changes can be presented in a Technical Standard Record (TSR). The list is presented as an informal table.

TSR must not be used in the IPD.

## 2.11 Table of contents

The Table of Contents (TOC) gives the title of all documents together with the data module code and its applicability. The documents must be presented in the order of appearance in the publication. The TOC must not include the front matter documents Title page, LOEDM, LOEP, Change Record (CR) or TOC itself. If the publication is divided with tab dividers a TOC also can be given to each chapter or part.

## 2.12 List of applicable specifications and documentation

Specifications and documents which are necessary to read or follow when using the publication can be presented in a List of Applicable Specifications and Documentation (LOASD). An example of a LOASD is given in Chap 5.2.1.18.

LOASD must not be used in the IPD.

## 2.13 List of support equipment

The List of Support Equipment (LOSE) lists the required support equipment, necessary to perform the tasks, described in the publication. The list of support equipment is to be used in IETP only.

LOSE must not be used in the IPD.

## 2.14 List of supplies

The List of Supplies (LOSU) lists the required supplies necessary to perform the tasks described in the publication. The list of supplies is to be used in IETP only.

LOSU must not be used in the IPD.

## 2.15 List of spares

The List of Spares (LOSP) lists the required spares necessary to perform the tasks described in the publication. This is used in IETP only.

LOSP must not be used in the IPD.

## 2.16 List of illustrations

The List of Illustrations (LOI) is a list of all illustrations contained in the publication and includes:

- ICN
- Title

This is used in IETP only.

## 2.17 Product cross-reference table

The Product Cross-reference Table (PCT) lists the products concerned by the publication. To each product is associated the corresponding product sets and other data related to the operation of the product.

The general mechanisms of the PCT are described in Chap 4.14.

There is a dedicated data module Schema for the PCT, refer to Chap 3.9.5.3.3 for details.

A display example is available in Chap 6.2.3.1.

## 2.18 Conditions cross-reference table

The Conditions Cross-reference Table (CCT) lists the technical conditions impacting the publication. To each technical condition is associated a status according to products and other data related to the technical condition itself.

The general mechanisms of the CCT are described in Chap 4.14.

There is a dedicated data module Schema for the CCT, refer to Chap 3.9.5.3.2 for details.

A display example is available in Chap 6.2.3.1.

## 2.19 Applicability cross-reference table

The general mechanisms of the Applicability Cross-reference Table (ACT) are described in Chap 4.14.

There is a dedicated data module Schema for the ACT, refer to Chap 3.9.5.3.1 for details.

A display example is available in Chap 6.2.3.1.

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use of LOEP**. The project must decide if it will deliver a LOEP instead of a LOEDM. Refer to Para 2.2.

**Use of the extended highlight data module**. The project or the organization must decide whether to use an extended highlight data module or not. Refer to Para 2.5.

# Chapter 3.9.5

| Chap No./Document No. | Title |
|---|---|
| Chap 3.9.5.1 | Data modules - Identification and status section |
| Chap 3.9.5.2 | Data modules - Content section |
| Chap 3.9.5.3 | Data modules - Applicability |
| REC-xml-20060816 | W3C Recommendation: Extensible Markup Language (XML) 1.0 (Fourth Edition) 1.0 (Fourth Edition) |

## 1 General

This chapter gives the user brief definitions to some of the most common XML terms used in this specification. The markup examples that are included in the chapter are XML markup examples. For the terminology, definitions and the use of XML, refer to REC-xml-20060816 W3C Recommendation: XML 1.0 (Fourth Edition).

The chapter is further broken down to give definitions and guidance on using the XML to create data modules.

Chap 3.9.5.1 gives the definitions and guidance for the identification and status section of all types of data modules.

The definitions and guidance for the common constructs and the 14 different types of content in the content section are given in Chap 3.9.5.2.

Chap 3.9.5.3 gives the rules for applicability.

Throughout these chapters, the requirements for mandatory and optional given below are coded as follows:

– (M) mandatory

  This means that the affected element name must be presented in the data module and that the required entries in the construct must be populated.

– (O) optional

  This means that the affected element name and its associated population can be omitted.

– (C) conditional

  This means that the affected element must be present in the data module, provided that the (optional) structure containing the element is included.

XML **elements** are written in `Courier 12 in blue` within brackets preceded by the word "element", eg element <`applic`>.

**Attributes** are written in `Courier 12 in black` without quotation marks and brackets preceded by the word "attribute", eg attribute `internalRefId`.

**Values** given in the text are written in `Courier 12 in blue` within quotation marks preceded by the word "value", eg value "`Value_1`".

**Entities** are written in `Courier 12 in black` without quotation marks and brackets preceded by the word "entity", eg entity `%INSDEL`;.

XML **examples** are written in `Courier 11 in black`.

Examples:

```
<language languageIsoCode="sx" countryIsoCode="US"/>
```

```
<language languageIsoCode="de" countryIsoCode="AT"/>
```

```
<reasonForUpdate id="rfu-001" updateHighlight="1"
updateReasonType="urt02"><simplePara>The tool set is
changed.</simplePara></reasonForUpdate>
```

# 2 XML terminology and definitions

## 2.1 Element

An element is a component of an XML instance, defined by the Schema and is identified in the document by descriptive markup, usually a start-tag and end-tag.

For example: <`para`>…<`/para`>. There is also a type of element called an empty element which does not possess an end-tag.

Example: <`security securityClassification="01"/`>.

## 2.2 Generic identifier

A generic identifier is a name of an element or "tag-name".

Example: The generic identifier of the element <para> is para.

## 2.3 Attribute

An attribute is a value that can be applied to an element.

Example: The values for day, month and year are numeric attributes of the <issueDate> element: <issueDate day="30" month="07" year="2000"/>.

Attributes are either mandatory (they must be given a value) or optional. Some attributes require a typed value, while other attribute values are selectable from a list. Certain attributes have a default value which is applied automatically if a value for the attribute is not specified.

## 2.4 Tag

The start of an element is marked by a start-tag, and the end by an end-tag (unless the element is an empty element). An element start-tag is comprised of a less-than sign [<], then the generic identifier, then, if required, a set of attributes followed by a greater-than sign [>].

Example: The start-tag of a paragraph is <para>.

An element end-tag is comprised of a less-than sign [<] followed by a slash [/], then the generic identifier and finally a greater-than sign [>].

Example: The end-tag of a paragraph is </para>.

In XML markup empty tags are represented like this <security securityClassification="01"/> or like this <unverified></unverified>.

## 2.5 XML Schemas

The XML Schema controls which elements can appear in an XML instance and in which order. The Schema also defines the rules for attributes and entities and provides data type constraints which describe valid units of data.

## 2.6 Data type string

String data is any character(s) entered between the start-tag and end-tag of an element (plain text) and characters between quotes that make up the value of an attribute.

Example: <para>This is plain text data</para>.

## 2.7 Entity

An entity is a character string which, in the final data module output, will be replaced by a character, symbol or an external file.

### 2.7.1 Character entities

Some characters required for data modules are not available on a computer keyboard, for example, degrees, fractions and Greek letters. These characters are made available on XML systems by substituting a character entity for the required character. Most XML systems allow an inserted character entity to be displayed on the screen as it will appear to the reader. When entering a character entity, it must be preceded by [&] and followed by [;], for example, in XML, the characters inserted for degrees [º] will be °.

It is important to remember that, in XML, character entities are case sensitive, so using an initial uppercase letter will affect the final character shown in the data module.

Example: Σ (uppercase S) = Σ, and σ (lowercase letter s) = σ.

Table 2 details some of the more common character entities currently in use. For a complete list, refer to the S1000D data module Schemas.

*Table 2 Example of commonly used character entities*

| Entity | Character | Entity | Character | Entity | Character | Entity | Character |
|---|---|---|---|---|---|---|---|
| alpha | α | epsis | ε | lt | < | plusmn | ± |
| amp | & | eta | η | micro | µ | prop | ∝ |
| beta | β | equiv | ≡ | mu | µ | psi | ψ |
| bull | • | gamma | γ | ne | ≠ | radic | √ |
| deg | ° | ge | ≥ | Ohm | Ω | rho | ρ |
| Delta | Δ | gt | > | Omega | Ω | Sigma | Σ |
| delta | δ | infin | ∞ | percnt | % | sigma | σ |
| divide | ÷ | Lambda | Λ | Phi | Φ | Theta | Θ |
| endash | – | lambda | λ | phis | φ | theta | θ |
| emdash | — | le | ≤ | pi | π | | |

### 2.7.2 External system entities

For illustrations and symbols, a system entity is inserted into the XML instance normally carried out by the system.

## 2.8 Use of some special characters

The following rules apply:

- Hyphen [-] is used in the data module code, ICN, publication module code, CSN and as a separator in normal text, eg between the element <`techName`> and the element <`infoName`> on data module titles.
- Space [ ] is used as a single space character (using spacebar on the keyboard) to substitute numbers in, for example, the CSN (Space = ASCII 32 (hexadecimal code 20).

**Note**

The special characters are in the above mentioned cases normally inserted by the formatting application and must not to be entered by the author.

**Note**

For the entry of XML elements and attributes which can be used as hyperlinks in the IETP (for example, CSN, part numbers, NSN), any spaces must be entered from the keyboard using the spacebar. Do not use XML character entities for these elements and attributes.

## 2.9 XML Schema representation

In S1000D some chapters include graphical representations of the XML Schemas fragments. This method allows the author to learn the schema structure of S1000D progressively. The symbols used are explained below.

Element content

Element with textual content (the "paragraph" symbol in the upper left of the elemet box indicate that it is either a pure textual element or a mixed content element).

Empty element.

Element occurrence indicators

Element with subelements. Subelements can be presented in another chart. In this case, just the "+" symbol appears (otherwise, the breakdown in displayed on the right side of the described element).

Required (M), (once and only once).

Optional (O), (zero or one time)

Required and repeatable (one or more times).

Optional and repeatable (zero or more times).

Attributes

Attributes of an element. A solid line around an attribute indicates that it is required (once and only once). A dotted line surrounding an attribute indicates that it is optional.

Connectors

Sequence of branches, mandatory. The contained elements (if present) must be in the order listed in the branches of the connector.

Sequence of branches, optional and repeatable. The contained branches (if present) must be in the order listed in the branches of the connector.

Choice of branches, mandatory. One and only branch is allowed from the defined branches of the choice.

Choice of branches, optional and repeatable. Zero to many branches in any order is allowed from the defined branches of the choice.

Choice of branches, mandatory and repeatable. One to many branches in any order is allowed from the defined branches of the choice.

Groups (do not appear in an XML instance)

Group of elements. Used in maintaining Schemas.

# 1 General

The identification and status section gives all the identification elements required to address and control the data module. It also provides the status elements for information on the security, quality and technical status together with the applicability of the overall data module content.

# 2 Identification and status section

**Description:** The element <`identAndStatusSection`> is used to contain the identification and status of a data module, which are captured in the two parts, identification and status.

**Markup element:** <`identAndStatusSection`> (M)

ICN-83007-0000000025-001-01

*Fig 1 Element <identAndStatusSection>*

**Attributes:**

– None

**Child elements:**

– <dmAddress> (M). Refer to Para 2.1.
– <dmStatus> (M). Refer to Para 2.2.

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

## 2.1 Identification part

**Description:** The element <dmAddress> is used to contain the unique identification and additional information supporting the data module.

**Markup element:** <dmAddress> (M)

ICN-83007-0000000026-001-01

*Fig 2 Element <dmAddress>*

**Attributes:**

– None

**Child elements:**

- <dmIdent> (M). Refer to Para 2.1.1.
- <dmAddressItems> (M). Refer to Para 2.1.2.

**Business rules decisions:**

- None identified

**Markup example:**

```
<dmAddress>
<dmIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="DA2" subSystemCode="3" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="720" infoCodeVariant="A" itemLocationCode="A">
</dmCode>
<language countryIsoCode="US" languageIsoCode="sx"/>
<issueInfo issueNumber="005" inWork="00"/>
</dmIdent>
<dmAddressItems>
<issueDate year="2007" month="07" day="31"/><dmTitle>
<techName>Headset</techName>
<infoName>Install procedures</infoName>
</dmTitle>
</dmAddressItems></dmAddress>
```

### 2.1.1 Data module identification

**Description:** The element <dmIdent> is used to contain the unique identification of the data module.

**Markup element:** <dmIdent> (M)

ICN-83007-0000000027-001-01

*Fig 3 Element <dmIdent>*

**Attributes:**

- None

**Child elements:**

- <identExtension> (O). Refer to Para 2.1.1.1.
- <dmCode> (M). Refer to Para 2.1.1.2.
- <language> (M). Refer to Para 2.1.1.3.
- <issueInfo> (M). Refer to Para 2.1.1.4.

**Business rules decisions:**

– None identified

**Markup example:**

```
<dmIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="DA2" subSystemCode="3" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="720" infoCodeVariant="A" itemLocationCode="A">
</dmCode>
<language countryIsoCode="US" languageIsoCode="sx">
</language>
<issueInfo issueNumber="005" inWork="00"/>
</dmIdent>
```

2.1.1.1 Data module code extension

**Description:** The element <identExtension> establishes a producer unique subdomain for instance identification. The data module identification extension gives the additional parameters needed to establish a unique identification of a data module in those cases when data module code, issue and in-work numbers together with the language and country are insufficient to form a universally unique identity.

**Markup element:** <identExtension> (O)

**Attributes:**

– extensionProducer (M), the data module producer the value of which forms part of the universally unique identifier of a data module instance and contains the CAGE code of the producer of the data module instance.
– extensionCode (M), the data module extended code the value of which is decided by the data module producer. Typically, but not necessarily, it will contain a customer related content, eg customer CAGE amended with a sequence number. If it is used, it must contain uppercase alphabetic (A-Z) and numeric (0-9) characters.

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– using of data module code extensions
– defining a list of CAGE codes

**Markup example:**

```
<identExtension extensionProducer="SF518"
extensionCode="ABC00231"/>
```

2.1.1.2 Data module code

**Description:** The element <dmCode> contains the data module code and forms part of the unique identifier of a data module. All data modules are allocated a data module code.

The data module code provides four top level pieces of information. The first is the identification of the Product, or part of the Product, about which the data module has been written, using the model identifier, the system difference code, the SNS, the disassembly code and the disassembly code variant. The second is the identification of the information type, using the

information code. The third is the identification of the location at which the information in the data module is appropriate, using the item location code. The fourth is the identification of the type of learning content in learning data modules. Refer to Chap 4.3.

**Markup element:** <dmCode> (M)

**Attributes:**

- modelIdentCode (M), the model identifier or project name. Refer to Chap 4.3.1
- systemDiffCode (M), the system difference code. Refer to Chap 4.3.2
- systemCode (M), the system code (part of the SNS). Refer to Chap 4.3.3
- subSystemCode (M), the subsystem code (part of the SNS). Refer to Chap 4.3.3
- subSubSystemCode (M), the sub-subsystem code (part of the SNS). Refer to Chap 4.3.3
- assyCode (M), the assembly code (part of the SNS).. Refer to Chap 4.3.3
- disassyCode (M), the disassembly code. Refer to Chap 3.8 and Chap 4.3.4
- diassyCodeVariant (M), the disassembly code variant. Refer to Chap 4.3.5
- infoCode (M), the information code. Refer to Chap 4.3.6
- infoCodeVariant (M), the information code variant. Refer to Chap 4.3.7
- itemLocationCode (M), the item location code. Refer to Chap 4.3.8
- learnCode (O), the learn code. Refer to Chap 4.3.9 and Chap 8.5
- learnEventCode (O), the learn event code. Refer to Chap 3.9.5.2.13 and Chap 4.3.10

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- data module coding strategy
- hierarchical allocation of information codes

**Markup example:**

Markup example for maintenance data modules

```
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="DA2" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="041" infoCodeVariant="A" itemLocationCode="A"/>
```

Markup example for training data modules

```
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="DA2" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="041" infoCodeVariant="A" itemLocationCode="A"
learnCode="T12" learnEventCode="C"/>
```

2.1.1.3 Language

**Description:** The element <language> is used to describe the language in which the data module is written.

**Markup element:** <language> (M)

**Attributes:**

- `languageIsoCode` (M). Generally, this attribute is coded by using the two alpha characters from International Standards Organisation (ISO) 639. Simplified languages are coded by using additional codes similar to, and not in conflict with, ISO 639 codes. For example, `languageIsoCode="sx"` means a Simplified Technical English® (ASD-STE100) data module and `languageIsoCode="ra"` means a rationalized French data module.
- `countryIsoCode` (M). This attribute is coded using the two alpha characters from ISO 3166 to denote the country where the language is spoken.

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- choice of language code and country code

**Markup example:**

The following example is for a data module written in the default language:

```
<language languageIsoCode="sx" countryIsoCode="US"/>
```

The following example is for a data module written in Simplified Technical English with Oxford English spelling:

```
<language languageIsoCode="sx" countryIsoCode="GB"/>
```

The following example is for a data module written in Rationalized French:

```
<language languageIsoCode="ra" countryIsoCode="FR"/>
```

The following example is for a data module written in German:

```
<language languageIsoCode="de" countryIsoCode="DE"/>
```

The following example is for a data module written in German for an Austrian end user:

```
<language languageIsoCode="de" countryIsoCode="AT"/>
```

2.1.1.4 Issue information

**Description:** The element `<issueInfo>` contains the issue number of the data module.

**Markup element:** `<issueInfo>` (M)

**Attributes:**

- `issueNumber` (M). Every approved issue of a data module must be allocated an incremented issue number which, with the data module code, uniquely identifies that instance of the data module. The initial issue must be numbered with the value "`001`", which must be incremented with every approved release of a data module.
- `inWork` (M). This attribute gives the "inwork" number of the unreleased data module. It can be used for monitoring and control of intermediate drafts within a project. The initial inwork number is set to the value "`01`", and is incremented with every change to the unreleased data module.

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– exchange of draft data modules within the project

**Markup example:**

Examples (These examples show the use of the attribute `inWork`):

A data module that is inwork, where this is the second draft

```
<issueInfo issueNumber="000" inWork="02"/>
```

A data module that is released for the first time

```
<issueInfo issueNumber="001" inWork="00"/>
```

A data module that is the subject of a first change to the content section and is in work

```
<issueInfo issueNumber="001" inWork="01"/>
```

A data module that has been changed and released for the second time

```
<issueInfo issueNumber="002" inWork="00"/>
```

### 2.1.2 Date module address items

**Description:** The element <`dmAddressItems`> contains information that is supplementary to the data module identification but not part of the unique identifier.

**Markup element:** <`dmAddressItems`> (M)

ICN-83007-0000000028-001-01

*Fig 4 Element <`dmAddressItems`>*

**Attributes:**

– None

**Child elements:**

– <issueDate> (M). Refer to Para 2.1.2.1.
– <dmTitle> (M). Refer to Para 2.1.2.2.

**Business rules decisions:**

– None identified

**Markup example:**

```
<dmAddressItems>
<issueDate year="2007" month="07" day="31"/><dmTitle>
<techName>Headset</techName>
<infoName>Install procedures</infoName>
</dmTitle>
</dmAddressItems>
```

2.1.2.1 Issue date

**Description:** The element <issueDate> contains date information for the data module. Every issue of a data module whether initially written, completely revised or updated by changes, must be allocated an ISO 8601 calendar date in the form YYYY-MM-DD.

**Markup element:** <issueDate> (M)

**Attributes:**

– year (M). A four digit number, which is the year of issue.
– month (M). A two digit number, which is the month of issue.
– day (M). A two digit number, which is the day of issue.

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– definition of the issue date

**Markup example:**

```
<issueDate year="2007" month="02" day="28"/>
```

2.1.2.2 Data module title

**Description:** The element <dmTitle> contains the title of the data module. The data module title must give meaning to the Product identification and action elements of the data module code. Authoring of titles must be in accordance with Chap 3.9.5.2.1.5.

**Markup element:** <dmTitle> (M)

**Attributes:**

– None

**Child elements:**

- <techName> (M). Refer to Para 2.1.2.2.1.
- <infoName> (O). Refer to Para 2.1.2.2.2.

**Business rules decisions:**

- None identified

**Markup example:**

```
<dmTitle>
<techName>Steering</techName>
<infoName>Description of how it is made</infoName>
</dmTitle>
```

*2.1.2.2.1 Technical name*

**Description:** The element <techName> content must reflect the name of the hardware or function. That is, it must reflect the system, subsystem or sub-subsystem concerned.

Examples:

- Aircraft
- Landing gear system
- Hydraulic accumulator No. 2
- Three axes trim actuator
- Servicing

**Markup element:** <techName> (M)

**Attributes:**

- None

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- rules for technical names
- source of the technical names

**Markup example:**

```
<techName>Steering</techName>
```

*2.1.2.2.2 Information name*

**Description:** The element <infoName> is linked to the information code using the attribute infoCode. Normally the information name is the short description of the information code. For example, information code 520 will have information name "Remove procedure". Projects can decide to modify (or extend) the information name to one that is more suitable, provided the sense of the information code is maintained. An example of where this could be used would be the information code 251 is "Clean procedures". A project can have a data module that tells the reader how to clean with water (this could be 251A) another data module could tell the reader how to clean with air (this could be 251B). In both cases, the information name can be extended from "Clean procedures" to "Clean procedures (clean with water)" and "Clean procedures (clean with air)".

The information name is used to complete the data module title by adding the meaning of the information code.

Examples:

- A description of how it is made (information code 041)
- Functional test (information code 340)
- Remove procedures (vertical) (information code 520 variant A)
- Remove procedures (horizontal) (information code 520 variant B)

The information code is set to "000" when the SNS gives the function.

Examples:

- General maintenance
- Safety and protective devices
- Fatigue index calculations
- Time limits
- Preflight inspection
- Principal dimensions
- Recovering
- Static stability
- Mass and balance data
- Weigh procedure
- Level procedure
- Handling
- Scheduled servicing
- Hangar safety

**Markup element:** <infoName> (O)

**Attributes:**

- None

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of the element <infoName>
- rules for information names
- using the correct information name to the appropriate Schema

**Markup example:**

```
<infoName>Description of how it is made</infoName>
```

## 2.2 Status part

**Description:** The element <dmStatus> contains information about the status of the data module.

**Markup element:** <dmStatus> (M)

ICN-83007-0000000029-001-01

*Fig 5 Element <dmStatus>*

**Attributes:**

- id (O), the identifier of the <dmStatus> element. Refer to Chap 3.9.5.2.1.2.
- issueType (O). This attribute gives the issue status of the data module. There are eight values that can be used.
  - "new". Data modules up to and including the initial issue of the approved release must have the attribute issueNumber set to the value "000" for inwork versions or value "001" for the initial issue and have the attribute issueType set to the value "new".
  - "deleted". Deletion of data modules is treated as a special case of update. The data module, itself is not physically deleted from the CSDB but marked as deleted by setting the attribute issueType to the value "deleted".
  - "changed". Data modules that have been changed and have the changes indicated within the data module using change elements and attributes, must have the attribute issueType set to the value "changed".
  - "revised". Data modules that have been totally revised and that contain no change elements or attributes must have the attribute issueType set to the value "revised".

- "status". Data modules that have had their identification and status information updated must have the attribute issueType set to the value "status".
- "rinstate-status". Data modules that have been reinstated from a previously deleted data module and have only the status information changed must have the attribute issueType set to the value "rinstate-status". In the simplest case, this status change must require setting the attribute issueType to the value "rinstate-status".
- "rinstate-changed". Data modules that have been reinstated from a previously deleted data module and have the changes indicated by change elements and attributes, must have the attribute issueType set to the value "rinstate-changed".
- "rinstate-revised". Data modules that have been reinstated from a previously deleted data module and have the changes not indicated by change elements and attributes, must have the attribute issueType set to the value "rinstate-revised".

Table 2 shows the permitted values of the attribute issueType, where "X" shows that the value is permitted.

*Table 2 Values of the issue type attribute*

| **Current issue** | **Next issue of data module** | | | | | |
|---|---|---|---|---|---|---|
| | new | revised | changed | deleted | status | rinstate-x |
| new | | X | X | X | X | |
| revised | | X | X | X | X | |
| changed | | X | X | X | X | |
| deleted | | | | | | X |
| status | | X | X | X | X | |
| rinstate-x | | X | X | X | X | |

When work first starts on a data module, the attribute issueType is set to the value "new", while the issue number is set to the value "000" and inwork number to "01", using the attribute issueNumber and attribute inWork of element <issueInfo>. Then, when the data module is released, the attribute inWork is reset to the value "00", and the issue number incremented to indicate approved release of that instance of the data module. From issue "002" onwards the attribute issueType must not be set to the value "new" but is to reflect the release status of the instance of the data module.

**Child elements:**

- <sourceDmIdent> (O). Refer to Para 2.2.1.
- <security> (M). Refer to Para 2.2.2.
- <dataRestrictions> (O). Refer to Para 2.2.3.
- <logo> (O). Refer to Para 2.2.4.
- <responsiblePartnerCompany> (M). Refer to Para 2.2.5.
- <originator> (M). Refer to Para 2.2.6.
- <applicCrossRefTableRef> (M). Refer to Para 2.2.7.

- <applic> (M). Refer to Chap 3.9.5.3.
- <referencedApplicGroup> (O). Refer to Chap 3.9.5.3.
- <techStandard> (O). Refer to Para 2.2.10.
- <brexDmRef> (M). Refer to Para 2.2.11.
- <qualityAssurance> (M). Refer to Para 2.2.12.
- <systemBreakdownCode> (O). Refer to Para 2.2.13.
- <functionalItemCode> (O). Refer to Para 2.2.14.
- <functionalItemRef> (O). Refer to Para 2.2.15.
- <skillLevel> (O). Refer to Para 2.2.16.
- <reasonForUpdate> (C). Refer to Chap 3.9.5.2.1.1.
- <productSafety> (O). Refer to Para 2.2.18.
- <remarks> (O). Refer to Para 2.2.19.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- deleted data modules
- retention of deleted and changed data modules
- changed/revised ratio

**Markup example:**

Refer to Para 4.

### 2.2.1 Source data module identification part

**Description:** The element <sourceDmIdent> contains the identification of the source data module on which the current data module instance is based.

**Markup element:** <sourceDmIdent> (O)

**Attributes:**

- None

**Child elements:**

- <identExtension> (O). Refer to Para 2.1.1.1.
- <dmCode> (M). Refer to Para 2.1.1.2.
- <language> (M). Refer to Para 2.1.1.3.
- <issueInfo> (M). Refer to Para 2.1.1.4.

**Business rules decisions:**

- None identified

**Markup example:**

```
<sourceDmIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="D00" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="131" infoCodeVariant="A" itemLocationCode="A"/>
<language languageIsoCode="en" countryIsoCode="US"/>
<issueInfo issueNumber="004" inWork="00"/>
</sourceDmIdent>
```

### 2.2.2 Security classification

**Description:** The element <security> contains the security classification of the complete data module and its contained or associated illustrations.

**Markup element:** <security> (M)

**Attributes:**

- securityClassification (M), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use and definitions of the available attributes
- Priorities of the attributes.
- The definitions of the meanings for the ranges of classification values.

**Markup example:**

The following is an example of a data module that could be classified secret, with a commercial classification of Commercial in Confidence and a caveat of United Kingdom (UK) Eyes Only.

```
<security securityClassification="01"
commercialClassification="cc51" caveat="cv51"/>
```

The following shows a data module that has the lowest possible security classification.

```
<security securityClassification="01"/>
```

### 2.2.3 Data restrictions

**Description:** The element <dataRestrictions> contains the instructions and information, applicable to the data module, that relate to the use, storage and handling. This element can contain applicability information.

**Markup element:** <dataRestrictions> (O)

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the data restrictions element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <restrictionInstructions> (C). Refer to Para 2.2.3.1.
- <restrictionInfo> (O). Refer to Para 2.2.3.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of data restrictions information
- use of applicability information

**Markup example:**

```
<dataRestrictions>
<restrictionInstructions>
<dataDistribution>To be made available to all S1000D
users.</dataDistribution>
<exportControl><exportRegistrationStmt>
<simplePara>Export of this data module to all countries that are
the residence of organizations that are users of S1000D is
permitted. Storage of this data module is to be at the
discretion of the organization.</simplePara>
</exportRegistrationStmt></exportControl>
<dataHandling>There are no specific handling instructions for
this data module.</dataHandling>
<dataDestruction>Users may destroy this data module in
accordance with their own local procedures.</dataDestruction>
<dataDisclosure>There are no dissemination limitations that
apply to this data module.</dataDisclosure>
</restrictionInstructions>
<restrictionInfo>
<copyright>
<para>TPSMG UK, 2003-2010</para>
<para>Government License - TPSMG 001</para>
</copyright>
<policyStatement>TPSMG TOR 001</policyStatement>
<dataConds>There are no known conditions that would change the
data restrictions for, or security classification of, this data
module.</dataConds>
</restrictionInfo>
</dataRestrictions>
```

2.2.3.1 Restriction instructions

**Description:** The element <`restrictionInstructions`> contains the instructions that are to be followed when data restrictions apply.

**Markup element:** <`restrictionInstructions`> (C)

ICN-83007-0000000030-001-01

*Fig 6 Element <`restrictionInstructions`>*

**Attributes:**

- id (O), the identifier of the restriction instructions element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <dataDistribution> (M). Refer to Para 2.2.3.1.1.
- <exportControl> (O). Refer to Para 2.2.3.1.2.
- <dataHandling> (O). Refer to Para 2.2.3.1.3.
- <dataDestruction> (O). Refer to Para 2.2.3.1.4.
- <dataDisclosure> (O). Refer to Para 2.2.3.1.5.
- <supersedure> (O). Refer to Para 2.2.3.1.6.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of instructions

**Markup example:**

```
<restrictionInstructions>
<dataDistribution>To be made available to all S1000D
users.</dataDistribution>
<exportControl><exportRegistrationStmt>
<simplePara>Export of this data module to all countries that are
the residence of organizations that are users of S1000D is
permitted. Storage of this data module is to be at the
discretion of the organization.</simplePara>
</exportRegistrationStmt></exportControl>
<dataHandling>There are no specific handling instructions for
this data module.</dataHandling>
<dataDestruction>Users may destroy this data module in
accordance with their own local procedures.</dataDestruction>
<dataDisclosure>There are no dissemination limitations that
apply to this data module.</dataDisclosure>
</restrictionInstructions>
```

*2.2.3.1.1 Data distribution*

**Description:** The element <dataDistribution> contains the instructions for distribution of a data module.

**Markup element:** <dataDistribution> (M)

**Attributes:**

- id (O), the identifier of the data distribution element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– content of the distribution list

**Markup example:**

```
<dataDistribution>To be made available to all S1000D
users.</dataDistribution>
```

*2.2.3.1.2 Export control*

**Description:** The element <`exportControl`> contains the information regarding export control of the data module. For a full explanation of the description and use of the export control elements and attributes refer to Chap 3.9.5.1.1.

*2.2.3.1.3 Data handling*

**Description:** The element <`dataHandling`> contains any handling instructions, including storage, that are specific to the data module.

**Markup element:** <`dataHandling`> (O)

**Attributes:**

– `id` (O), the identifier of the data handling element. Refer to Chap 3.9.5.2.1.2.
– `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– handling requirements

**Markup example:**

```
<dataHandling>There are no specific handling instructions for
this data module.</dataHandling>
```

*2.2.3.1.4 Data destruction*

**Description:** The element <`dataDestruction`> contains any destruction instructions that are specific to the data module.

**Markup element:** <`dataDestruction`> (O)

**Attributes:**

– `id` (O), the identifier of the data destruction element. Refer to Chap 3.9.5.2.1.2.
– `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

– `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– content of destruction instructions

**Markup example:**

```
<dataDestruction>Users may destroy this data module in
accordance with their own local procedures.</dataDestruction>
```

*2.2.3.1.5 Data disclosure*

**Description:** The element <`dataDisclosure`> contains any special instructions with regard to the dissemination of the data module.

**Markup element:** <`dataDisclosure`> (O)

**Attributes:**

– `id` (O), the identifier of the data disclosure element. Refer to Chap 3.9.5.2.1.2.
– `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– content of the disclosure instructions

**Markup example:**

```
<dataDisclosure>There are no dissemination limitations that
apply to this data module.</dataDisclosure>
```

*2.2.3.1.6 Supersedure*

**Description:** The element <`supersedure`> contains a notice that the data module supersedes other data modules.

**Markup element:** <`supersedure`> (O)

**Attributes:**

– `id` (O), the identifier of the supersedure element. Refer to Chap 3.9.5.2.1.2.
– `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

– `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– <`subScript`> (O). Refer to Chap 3.9.5.2.1.10.
– <`superScript`> (O). Refer to Chap 3.9.5.2.1.10.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– content of Supersedure

**Markup example:**

```
<supersedure>This data module supersedes DMC-S1000D-A-03-09-
0501-00A-040A-A</supersedure>
```

2.2.3.2 Restriction information

**Description:** The element <`restrictionInfo`> contains any other information that is related to data restrictions, such as copyright information, policy references and other conditions.

**Markup element:** <`restrictionInfo`> (O)

ICN-83007-0000000031-001-01

*Fig 7 Element <`restrictionInfo`>*

**Attributes:**

– `id` (O), the identifier of the restriction information element. Refer to Chap 3.9.5.2.1.2.
– `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– <`copyright`> (C). Refer to Para 2.2.3.2.1.
– <`policyStatement`> (O). Refer to Para 2.2.3.2.2.
– <`dataConds`> (M). Refer to Para 2.2.3.2.4.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– content of other information

**Markup example:**

```
<restrictionInfo>
<copyright>
<copyrightPara>TPSMG UK, 2003-2010</copyrightPara>
<policyStatement>TPSMG TOR 001</policyStatement>
<dataConds>There are no known conditions that would change the
data restrictions for, or security classification of, this data
module.</dataConds>
</restrictionInfo>
```

*2.2.3.2.1 Copyright*

**Description:** The element <copyright> contains the copyright statement.

There are two methods for identifying copyright information for a particular data module. These are:

- by including the copyright statement(s) directly in data modules
- by reference to a specific data module that contain the copyright information

Both methods are permitted.

**Markup element:** <copyright> (O)

ICN-83007-0000000044-001-01

*Fig 8 Element <copyright>*

**Attributes:**

- id (O), the identifier of the copyright element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

**Child elements:**

- <copyrightPara> (M). Refer to Para 2.2.3.2.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- requirements for copyright information
- include copyright in each data module, cross reference to a copyright data module or do not include copyright information at all
- implications on data module updating

**Markup example:**

Method 1: Recording copyright information directly in a data module. Note the use of the copyright character entity © to get the required symbol "©".

```
<copyright>
<copyrightPara>TPSMG UK, 2003-2010</copyrightPara>
</copyright>
```

Method 2: Reference to a specific copyright data module(s):

```
<copyright>
<copyrightPara>For Copyright information, refer to
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000D" systemDiffCode="A"
systemCode="00" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="A"
infoCode="021" infoCodeVariant="A" itemLocationCode="D" />
</dmRefIdent>
</dmRef> and
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000D" systemDiffCode="A"
systemCode="00" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="01" disassyCodeVariant="A"
infoCode="021" infoCodeVariant="A" itemLocationCode="D" />
</dmRefIdent>
</dmRef>
</copyrightPara>
</copyright>
```

*2.2.3.2.2 Copyright paragraph*

**Description:** The element <`copyrightPara`> contains the copyright statement itself or provides a cross-reference to another data module, which contains the statement.

**Markup element:** <`copyrightPara`> (C)

**Attributes:**

- `applicRefId` (O), the applicability information. Refer to Chap 3.9.5.3.
- `id` (O), the identifier of the copyright paragraph element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

**Child elements:**

- <`emphasis`> (C). Refer to Chap 3.9.5.2.1.10.
- <`subScript`> (C). Refer to Chap 3.9.5.2.1.10.
- <`superScript`> (C). Refer to Chap 3.9.5.2.1.10.
- <`dmRef`> (C). Refer to Chap 3.9.5.2.1.2.
- <`randomList`> (C). Refer to Chap 3.9.5.2.1.3.

**Business rules decisions:**

- None identified

**Markup example:**

```
<copyrightPara>For Copyright information, refer to
<dmRef>
```

```
<dmRefIdent>
<dmCode modelIdentCode="S1000D" systemDiffCode="A"
systemCode="00" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="A"
infoCode="021" infoCodeVariant="A" itemLocationCode="D" />
</dmRefIdent>
</dmRef> and
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000D" systemDiffCode="A"
systemCode="00" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="01" disassyCodeVariant="A"
infoCode="021" infoCodeVariant="A" itemLocationCode="D" />
</dmRefIdent>
</dmRef>
</copyrightPara>
```

*2.2.3.2.3 Policy reference*

**Description:** The element <policyStatement> contains the reference to the security policy information.

**Markup element:** <policyStatement> (O)

**Attributes:**

- id (O), the identifier of the policy reference element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- content of policy reference information

**Markup example:**

```
<policyStatement>TPSMG TOR 001</policyStatement>
```

*2.2.3.2.4 Data conditions*

**Description:** The element <dataConds> contains any information on any special conditions that can apply to the data module. For example the security classification of a data module may have to change when aggregated with other data modules with similar conditions.

**Markup element:** <dataConds> (O)

**Attributes:**

- id (O), the identifier of the data conditions element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

– `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– content of data conditions information

**Markup example:**

```
<dataConds>This document is supplied to ACME Ltd. for the use of
personnel employed in the Maintenance of  Moff's Aero Engines
operated by ACME Ltd.</dataConds>
```

The following example shows the complete data restrictions that apply to a data module. In the example, the following applies:

– it must be delivered by hand
– it must be stored in a secure safe for not longer than six months
– the policy is contained in UKSysOps and the disclosure is to ACME.
– the full copyright statement can be found in a referenced data module
– there are special conditions that apply to this data module in that it can only be used by Moff's Aero Engines personnel in the maintenance of their engines

```
<dataRestrictions>
<restrictionInstructions>
<dataDistribution>By hand</dataDistribution>
<exportControl>Must stay within the UK</exportControl>
<dataHandling>Must be stored in a secure safe for not longer
than 6 months</dataHandling>
<dataDestruction>Incineration</dataDestruction>
<dataDisclosure>This information is the property of Utopia Ltd.
and is not to be copied, or communicated to a third
party.</dataDisclosure>
</restrictionInstructions>
<restrictionInfo>
<copyright>
<simplePara>For copyright information, refer to
<dmRef>…</dmRef>.
</simplePara>
</copyright>
<policyStatement>UKSysOps</policyStatement>
<dataConds>This document is supplied to ACME Ltd. for the use of
personnel employed in the Maintenance of  Moff's Aero Engines
operated by ACME Ltd.</dataConds>
</restrictionInfo>
</dataRestrictions>
```

### 2.2.4 Logo

**Description:** The element <`logo`> contains the reference to the manufacturer's, project's or sponsor's logotype.

**Markup element:** <`logo`> (O)

**Attributes:**

– None

**Child elements:**

– <symbol> (C). Refer to Chap 3.9.5.2.1.10.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– use of the logo

**Markup example:**

```
<logo>
<symbol infoEntityIdent="ICN-S3627-S1000D0494-001-01"/>
</logo>
```

### 2.2.5 Responsible partner company

**Description:** The element <responsiblePartnerCompany> contains the company or organization responsible for the data module. Only one entry is permissible.

The responsible partner company must indicate the company or organization responsible for the data module. In many projects there can be two or more partner companies and, in these cases, the organization must designate which company is the responsible for which data modules. Only the responsible partner company is to be indicated within the data module.

**Note**

A responsible partner company can be defined as one of the companies or organization making up a consortium pursuing a common project. Each of these partner companies is responsible for a certain share of the total project effort; however, only one is designated as responsible for the population of the CSDB.

This company or organization must be indicated by at least one of either the name of the company and/or the company's CAGE code, which is the preferred method or, for illustration control numbers, a project specific single alphanumeric character code as defined in Chap 4.4. However, if a responsible partner company has an enterprise code, then that code must be used.

**Markup element:** <responsiblePartnerCompany> (M)

**Attributes:**

– enterpriseCode (O), containing the CAGE code of the enterprise.
– id (O), the identifier of the responsible partner company element. Refer to Chap 3.9.5.2.1.2.

**Child elements:**

– <enterpriseName> (O). Refer to Chap 3.9.5.2.11.6.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– use of the optional enterprise element and attribute
– use of the element <enterpriseName>
– use of the CAGE code
– list of permitted CAGE codes for the project

**Markup example:**

The first example is for a project which does not use the element `enterpriseName`.

```
<responsiblePartnerCompany enterpriseCode="U8025"/>
```

This example is for a project that uses the element `<enterpriseName>`.

```
<responsiblePartnerCompany enterpriseCode="U8025">
<enterpriseName>UK MoD</enterpriseName>
</responsiblePartnerCompany>
```

### 2.2.6 Originator

**Description:** The element <originator> contains the identifier of the originating company or organization responsible for the production of the data module. The originator's code is indicated with the company name, the CAGE code, which is the preferred method, or both. Normally, the originator is defined as the designated design authority of the Product; however, projects must nominate the originators. If a responsible partner company has an enterprise code, then that code must be used.

**Markup element:** <originator> (M)

**Attributes:**

- `exterpriseCode` (O). Refer to Para 2.2.5.
- `id` (O), the identifier of the originator element. Refer to Chap 3.9.5.2.1.2.

**Child elements:**

- <enterpriseName> (O). Refer to Chap 3.9.5.2.11.6.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of the optional enterprise element and attribute
- use of the element <originator>
- use of the CAGE code
- list of permitted CAGE codes for the project

**Markup example:**

The first example is for a project which uses the CAGE.

```
<originator enterpriseCode="U8025"/>
```

This example is for a project that uses the element `enterpriseName`.

```
<originator>
<enterpriseName>Bikey Bikes</enterpriseName>
</originator>
```

### 2.2.7 Applicability cross-reference table reference

**Description:** The element <applicCrossRefTableRef> contains a pointer to the Applicability Cross-reference Table (ACT) data module that applies to the data module. Applicability and the ACT data module and related aspects are described in Chap 4.14 and Chap 3.9.5.3.1.

**Markup element:** <applicCrossRefTableRef> (M)

**Attributes:**

– None

**Child elements:**

– <dmRef> (M). Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

– None identified

**Markup example:**

```
<applicCrossRefTableRef>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="D00" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="00W" infoCodeVariant="A" itemLocationCode="D" />
<issueInfo issueNumber="003" inWork="00"/>
</dmRefIdent>
</dmRef>
</applicCrossRefTableRef>
```

### 2.2.8 Applicability

For detailed information about applicability, refer to Chap 3.9.5.3.

### 2.2.9 Inline applicability

For detailed information about applicability, refer to Chap 3.9.5.3.

### 2.2.10 Technical standard

**Description:** The element <techStandard> contains the authorized technical standard and associated data to be entered, describing the information basis used to write the data module. The information basis can be described by giving, for example, the modification or drawing standard including amendments, alterations etc or a publication baseline. Technical standard, in this context, is defined as the technical design and development level of the technical information of the Product, on which the data module has been based. This element contains authority block or technical publications baseline number or both.

**Markup element:** <techStandard> (O)

ICN-83007-0000000032-001-01

*Fig 9 Element <techStandard>*

**Attributes:**

– None

**Child elements:**

- <authorityInfoAndTp> (C). Refer to Para 2.2.10.1.
- <authorityInfo> (C). Refer to Para 2.2.10.2.
- <techPubBase> (C). Refer to Para 2.2.10.3.
- <authorityExceptions> (M). Refer to Para 2.2.10.4.
- <authorityNotes> (M). Refer to Para 2.2.10.5.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of this element

**Markup example:**

```
<techStandard>
<authorityInfoAndTp>
<authorityInfo>20010131</authorityInfo>
<techPubBase>Bike book</techPubBase>
</authorityInfoAndTp>
<authorityExceptions>"..."</authorityExceptions>
<authorityNotes>"..."</authorityNotes>
</techStandard>
Authority information and publication baseline number
```

2.2.10.1 Authority block and technical publications information

**Description:** The element <authorityInfoAndTp> contains both the authority block information and the technical publications baseline when it is appropriate to use both.

**Markup element:** <authorityInfoAndTp> (C)

**Attributes:**

- None

**Child elements:**

- <authorityInfo> (M). Refer to Para 2.2.10.2.
- <techPubBase> (M). Refer to Para 2.2.10.3.

**Business rules decisions:**

- None identified

**Markup example:**

```
<authorityInfoAndTp>
<authorityInfo>20010131</authorityInfo>
<techPubBase>Bike book</techPubBase>
</authorityInfoAndTp>
```

2.2.10.2 Authority information

**Description:** The element <authorityInfo> contains the authority that owns the source data from which the data module is written. The codes to be used in this element are to be determined by the project.

**Markup element:** <authorityInfo> (C)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– authority information values

**Markup example:**

```
<authorityInfo>20010131</authorityInfo>
```

2.2.10.3 Publication baseline number

**Description:** The element <techPubBase> contains the technical publication baseline to which the data module is written. The publication baseline number represents the technical build standard, of the Product, which defines the technical standard by reference to a certain point in time. This is achieved by declaring a "Cut–off date" or milestone and listing the drawing set standard, relevant modification documents, etc, issued prior to the Cut–off or milestone date and used as source material for the production of data modules. The technical standard so defined, ensures that all data modules are to the same standard. Projects can also decide to use this element to record the delivery number of the Logistics Support Analysis Record (LSAR) to which the data module is written.

**Markup element:** <techPubBase> (C)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– determine what to use as the baseline

**Markup example:**

```
<techPubBase>Bike book 20010131</techPubBase>
```

2.2.10.4 Authority exceptions

**Description:** The element <authorityExceptions> contains deviations of the data module content from the standard given in the authority block for configurations.

**Markup element:** <authorityExceptions> (C)

**Attributes:**

– None

**Child elements:**

– <productConfiguration> (O). Refer to Para 2.2.10.4.1.

– <retrofit> (O). Refer to Para 2.2.10.4.4.

**Business rules decisions:**

– None identified

**Markup example:**

```
<productConfiguration>
<excludedModification>A12345</excludedModification>
<additionalModification>00345</additionalModification>
</productConfiguration>
<retrofit>
<modification authorizationIdent="K0378"
modificationType="post">
<modificationTitle>Improved suspension for Brook Trekker deluxe
models</modificationTitle>
</modification>
</retrofit>
```

*2.2.10.4.1 Product configuration*

**Description:** The element <productConfiguration> contains a reference to the Product configuration as defined for production in the authority block. Any deviation from that configuration or standard is shown by inserting the modification number.

**Markup element:** <productConfiguration> (O)

**Attributes:**

– None

**Child elements:**

– <excludedModification> (O). Refer to Para 2.2.10.4.2.
– <additionalModification> (O). Refer to Para 2.2.10.4.3.

**Business rules decisions:**

– None identified

**Markup example:**

```
<productConfiguration>
<excludedModification>A12345</excludedModification>
<additionalModification>00345</additionalModification>
</productConfiguration>
```

*2.2.10.4.2 Excluded modification*

**Description:** The element <excludedModification> contains an indication that the modification is not covered even though it was actually required.

**Markup element:** <excludedModification> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<excludedModification>A12345</excludedModification>
```

*2.2.10.4.3 Additional modification*

**Description:** The element <additionalModification> contains an indication that a modification is additionally covered.

**Markup element:** <additionalModification> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<additionalModification>00345</additionalModification>
```

*2.2.10.4.4 Retrofit*

**Description:** The element <retrofit> contains a reference to post delivery changes that are always performed in accordance with a retrofit order eg Pre– or Post–modification.

**Markup element:** <retrofit> (O)

**Attributes:**

– None

**Child elements:**

– <modification> (M). Refer to Para 2.2.10.4.5.

**Business rules decisions:**

– None identified

**Markup example:**

```
<retrofit>
<modification authorizationIdent="K0378"
modificationType="post">
<modificationTitle>Improved suspension for Brook Trekker deluxe
models</modificationTitle>
</modification>
</retrofit>
```

*2.2.10.4.5 Modification*

**Description:** The element <modification> contains the identification of the retrofit order.

**Markup element:** <modification> (M)

**Attributes:**

- `id` (O), the identifier of the modification element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `authorizationIdent` (M), used to contain the identification of the retrofit order
- `modificationType` (M), the type of modification in terms of pre, post and pre and post. This attribute can have one of the following values:
  - "`pre`", indicates that the data is the initial standard, or to a previous modification standard than the one given
  - "`post`" (D), indicates that the data is to a standard that is after the modification given
  - "`prandpo`", indicates that the data is to a standard that satisfies both a standard before and after the modification given
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <`modificationTitle`> (O). Refer to Para 2.2.10.4.6.

**Business rules decisions:**

- None identified

**Markup example:**

```
<modification authorizationIdent="K0378"
modificationType="post">
<modificationTitle>Improved suspension for Brook Trekker deluxe
models</modificationTitle>
</modification>
```

*2.2.10.4.6 Modification title*

**Description:** The element <`modificationTitle`> contains the title of the modification.

**Markup element:** <`modificationTitle`> (O)

**Attributes:**

- None

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

```
<modificationTitle>Improved suspension for Brook Trekker deluxe
models</modificationTitle>
```

2.2.10.5 Authority notes

**Description:** The element <`authorityNotes`> contains additional information that can be necessary to explain preceding entries. Whenever a data module is only applicable to one or a range of serial numbers, this is stated here. It is recommended that, where applicable, the titles of documents be given under authority exceptions. The notes are also be used for recording

deficiency reports, special technical orders, service bulletins, explanations of excluded and additional modifications, and similar documents.

**Markup element:** <authorityNotes> (C)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– population of this element

**Markup example:**

```
<authorityNotes>The LSAR baseline is the 27/10/2007
version.</authorityNotes>
```

### 2.2.11 Business rules reference

**Description:** The element <brexDmRef> contains a pointer to the business rules data module (BREX data module) that applies to the data module. For a detailed description of the BREX module and related aspects, refer to Chap 4.10.

**Markup element:** <brexDmRef> (M)

**Attributes:**

– None

**Child elements:**

– <dmRef> (M). Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– the need to develop project specific business rules

**Markup example:**

```
<brexDmRef>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="D04" subSystemCode="1" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="022" infoCodeVariant="A" itemLocationCode="D"/>
<issueInfo issueNumber="003" inWork="00"/>
</dmRefIdent>
</dmRef>
</brexDmRef>
```

### 2.2.12 Quality assurance

**Description:** The element <qualityAssurance> contains details of the status of the QA process as required by the project. The data module must be identified as either being

unverified or verified. This element can contain applicability information to indicate the applicability of the QA information. This applicability information must be a subset of the mandatory applicability settings for the complete data module. This applies equally to the element <qualityAssurance> and all its subelements.

**Markup element:** <qualityAssurance> (M)

ICN-83007-0000000033-001-01

*Fig 10 Element <qualityAssurance>*

**Attributes:**

– applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.

**Child elements:**

– <unverified> (C). Refer to Para 2.2.12.1.
– <firstverification> (C). Refer to Para 2.2.12.2.
– <secondverification> (O). Refer to Para 2.2.12.3.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– use of applicability information

**Markup example:**

```
<qualityAssurance>
<firstVerification verificationType="tabtop"/>
</qualityAssurance>
```

2.2.12.1 Unverified

**Description:** The element <unverified> identifies that the data module which has not yet been first verified.

**Markup element:** <unverified> (C)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– use of unverified data modules

**Markup example:**

```
<qualityAssurance>
<unverified/>
</qualityAssurance>
```

2.2.12.2 First verification

**Description:** The element <firstVerification> contains identifies a data module which has been first verified. For details on verification, refer to Chap 3.7.

**Markup element:** <firstVerification> (C)

**Attributes:**

– verificationType (M). This attribute can have one of the following values:
  - "onobject", used to indicate that the first verification was carried out at the Product
  - "tabtop", used to indicate that the first verification was carried out on a desktop
  - "ttandoo", used to indicate that the first verification was carried out at the Product and on a desktop

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<qualityAssurance>
<firstVerification verificationType="tabtop"/>
</qualityAssurance>
```

2.2.12.3 Second verification

**Description:** The element <secondVerification> contains identifies a data module which has been second verified. Data modules cannot be only second verified. They must also be first verified. For details on verification, refer to Chap 3.7.

**Markup element:** <secondVerification> (O)

**Attributes:**

– verificationType (M). This attribute can have one of the following values:
  - "onobject", used to indicate that the first verification was carried out at the Product
  - "tabtop", used to indicate that the first verification was carried out on a desktop
  - "ttandoo", used to indicate that the first verification was carried out at the Product and on a desktop

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– implementation of second verification

**Markup example:**

```
<qualityAssurance>
<firstVerification verificationType="onobject"/>
<secondVerification verificationType="ttandoo"/>
</qualityAssurance>
```

### 2.2.13 System breakdown code

**Description:** The element <systemBreakdownCode> contains a code that captures the physical breakdown for those projects that are producing data modules that are inline with other logistic databases.

**Markup element:** <systemBreakdownCode> (O)

**Attributes:**

– id (O), the identifier of the system breakdown code element. Refer to Chap 3.9.5.2.1.2.

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– use of the element

**Markup example:**

```
<systemBreakdownCode>BY142</systemBreakdownCode>
```

### 2.2.14 Functional item code

**Description:** The element <functionalItemCode> can contain a code that represents the functional breakdown.

**Markup element:** <functionalItemCode> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<functionalItemCode>AAI2392</functionalItemCode>
```

### 2.2.15 Functional item reference

**Description:** The element <functionalItemRef> contains a functional item number.

**Markup element:** <functionalItemRef> (O)

**Attributes:**

- `id` (O), the identifier of the functional item reference element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `functionalItemNumber` (M), the functional item number identifier. Refer to Chap 3.9.5.1.
- `functionalItemType` (O), ), the functional item is an exact or family functional item number. Refer to Chap 3.9.5.1. This attribute can have one of the following values:
  - "`exact`" - the functional item number (a given item)
  - "`family`" - the family functional item number (generic code for one component which has more than one position, eg: seats, lights)
- `manufacturerCodeValue` (O), the code of the manufacturer
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <`name`> (O), gives the name of the functional item. Refer to Chap 3.9.5.2.1.9.
- <`refs`> (O), references providing a link to the circuit breaker. Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

- None identified

**Markup example:**

```
<functionalItemRef functionalItemNumber="101HG1"
manufacturerCodeValue="2D671"/>
```

### 2.2.16 Skill level

**Description:** The element <`skillLevel`> contains identify the skill level to which the data module has been written.

When creating training data modules, which use other maintenance data modules, the project must ensure that a mechanism exists between the maintenance and training information that allows a "relationship" to be established between the required performance levels of the student, as recorded in a LMS supplied through the training system (eg Electronic Performance Support Systems (EPSS)), and the skill level of the person conducting the maintenance activity.

This can involve linking the skill of the maintainer to training information presented at the appropriate level for task completion, based on several factors such as the location of where task is being conducted and the complexity of the Product.

**Markup element:** <`skillLevel`> (O)

**Attributes:**

- `skillLevelCode` (C), the actual code. Refer to Chap 3.9.6.1.

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– use and definition of the element for training information

**Markup example:**

```
<skillLevel skillLevelCode="sk01"/>
```

### 2.2.17 Reason for update

**Description:** The element <reasonForUpdate> contains a short explanation of the reason for updating of the data module. It can be used at issue, release or during the production process. As data modules are issued, the previous content of this element must be updated or removed. The use of this element is normally not required for data modules that are at initial issue. For more details, refer to Chap 3.9.5.2.1.1.

**Markup element:** <reasonForUpdate> (C)

**Attributes:**

– applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
– id (O), the identifier of the <reasonForUpdate> element. Refer to Chap 3.9.5.2.1.2.
– updateReasonType (O). Refer to Chap 3.9.5.2.1.1.
– updateHighlight (O). Refer to Chap 3.9.5.2.1.1.

**Child elements:**

– <simplePara> (O). Refer to Chap 3.9.5.2.1.10.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– use of the element
– use of the element in conjunction with the production process
– use of applicability information

**Markup example:**

```
<reasonForUpdate updateReasonType="urt01" updateHighlight="1"
id="rfu-001">
<simplePara>CPF 2006-47AA: Applicability structure change and
addition of actref element</simplePara>
</reasonForUpdate>
<reasonForUpdate updateReasonType="urt01" updateHighlight="1"
id="rfu-002">
<simplePara>CPF 2006-48AA: Export control structure change,
addition of container elements</simplePara>
</reasonForUpdate>
```

### 2.2.18 Product safety

**Description:** The element <productSafety> contains an indication when a module is transmitting information that affects the safety of the product's users. The element <productSafety> can be empty or can contain textual information describing the urgency for processing the information in the module and handling of the module when third parties now operate the Product.

**Markup element:** <productSafety> (O)

**Attributes:**

– `safetyLabel` (M), must contain a short description of the type of safety issue or a category selected from industry standard safety labels.

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– use of product safety
– definition of safety label attributes

**Markup example:**

```
<productSafety safetyLabel="Alert">THIS SERVICE BULLETIN DATASET
HAS BEEN DELIVERED TO THE OPERATORS OF RECORD OF THE AFFECTED
AIRPLANES. IF AN AFFECTED AIRPLANE HAS BEEN LEASED OR SOLD, SEND
THE SERVICE BULLETIN TO THE NEW OPERATOR.</productSafety>
```

### 2.2.19 Remarks

**Description:** The element <`remarks`> can contain general remarks. If there are no remarks then this element need not be used.

**Markup element:** <`remarks`> (O)

**Attributes:**

– `applicRefId` (O), the applicability information. Refer to Chap 3.9.5.3.

**Child elements:**

– <`simplePara`> (O). Refer to Chap 3.9.5.2.1.10.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– use of the element
– use of applicability information

**Markup example:**

```
<remarks>
<simplePara>Incorporates repair instruction X15526172-
A</simplePara>
<simplePara>Incorporates repair instruction X15526172-
B</simplePara>
</remarks>
```

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

## 3.1 Data module code extensions

**Using of data module code extensions**. The project or the organization must decide whether the extended data module identification scheme has to be applied to achieve unique data module instance identities. Refer to Para 2.1.1.1.

**Define a list of CAGE codes**. The project or the organization must decide on the definition of a list of allowed CAGE codes that can be used to populate the attribute `extensionProducer`. Refer to Para 2.1.1.1.

## 3.2 Data module codes

**Data module coding strategy**. The project or the organization must decide on a data module coding strategy. Refer to Chap 4.3. Projects must also decide on which SNS is best suited to their needs. Refer to Chap 8.2 and Para 2.1.1.2.

## 3.3 Data module identification

**Choice of language**. The project or the organization must select the country and language codes and use them in a consistent manner across the project. Refer to Para 2.1.1.3.

**Exchange of draft data modules within the project**. The project or the organization must decide whether it is going to allow the exchange of draft data modules. Refer to Para 2.1.1.4.

## 3.4 Issue information

**The definition of the issue date**. The project or the organization must decide on the definition of the issue date. This can be, for example, the input date (ie the release to CSDB date), or the cut-off date for the information, etc. Refer to Para 2.1.1.4.

## 3.5 Information names

**Use of the element** `<infoName>`. The project or the organization must decide where the information name can be omitted. Although, in the Schema, the element `<infoName>` is optional, only under exceptional circumstances must it be omitted. Refer to Para 2.1.2.2.2.

**Rules for information names**. The project or the organization must decide on which information codes apply to their project. Not all information codes within S1000D will apply to a project. Further, there can be some that are defined by the project and some that can be modified. Where this is the case, it is recommended that the project compiles a list containing the list of information codes and variants that can be used, together with their information names. Refer to Para 2.1.2.2.2.

## 3.6 Technical names

**Rules for technical names**. The project or the organization must decide whether or not a project list is generated which defines the SNS and a list of technical names. Refer to Para 2.1.2.2.1.

**Source of the technical names**. The project or the organization must decide on the source of the technical names (preferably a terminology database) and use them consistently. In all cases, the technical name must reflect the item represented by the SNS. Refer to Para 2.1.2.2.1.

## 3.7 Changes to data modules

**Retention of deleted and old data modules**. The project or the organization must decide on the length of time that they retain changed and old data modules. Refer to Para 2.2.

**Changed/revised ratio**. The project or the organization must decide on a sensible percentage threshold where the amount of changes is too many to be represented by change markers, making the information difficult to read. This threshold is then used to decide when a data module becomes "revised" rather than "changed". Refer to Para 2.2.

## 3.8 Security

**Use of elements and attributes**. The project or the organization must decide the use and definitions of the available attributes. Refer to Para 2.2.2.

**Priorities**. The project or the organization must decide on the priority and relationship of the attribute `securityClassification`, the attribute `commercialClassification` and the attribute `caveat`, if they are to be used. Refer to Para 2.2.2.

**The definitions of the classification values**. The project or the organization must decide on the definition of meanings for the ranges of classification values. Refer to Para 2.2.2.

## 3.9 Data restrictions

**Use of data restrictions information**. The project or the organization must decide on the inclusion of the data restrictions information. Projects must be aware that if this is used, then various elements within are mandatory. Refer to Para 2.2.3.

**Use of applicability information**. The project or the organization must decide if it is permitted to differentiate data restrictions depending on Product configuration. Refer to Para 2.2.3.

**Projects must decide on the use of instructions**. The project or the organization must decide on the inclusion of export controls, handling, destruction and disclosure instructions. Refer to Para 2.2.3.1.

**Content of the distribution list**. The project or the organization must decide on the extent and content of the distribution list that is appropriate to a data module. Refer to Para 2.2.3.1.1.

**Content of export control details**. The project or the organization must decide on the requirements and procedures that must be applied to a data module regarding export controls. Refer to Para 2.2.3.1.2.

**Handling requirements**. The project or the organization must decide on the handling requirements and procedures that must be applied to a data module. Refer to Para 2.2.3.1.3.

**Content of destruction instructions**. The project or the organization must decide on the extent on appropriateness of destruction instructions that apply to a data module. Refer to Para 2.2.3.1.4.

**Content of disclosure instructions**. The project or the organization must decide to whom the data module can be disclosed. Refer to Para 2.2.3.1.5.

**Content of Supersedure**. Projects must decide on the requirements that must be applied to a data module with regard to supersedure notices. Refer to Para 2.2.3.1.6.

**Content of other information**. The project or the organization must decide on the extent of additional information to be included in a data module. Refer to Para 2.2.3.2.

**Copyright information**. The project or the organization must decide if this information is required, and which of the recommended methods is to be used for this purpose. Any copyright information must be obtained from the relevant authority. A project must also be aware of the implications on data module updating if the copyright information changes and the information is stored in each data module. Refer to Para 2.2.3.2.1.

**Method of including copyright information**. The project or the organization must decide, if copyright information is to be included, which method to include the copyright information in each data module or to cross refer to a copyright data module. Refer to Para 2.2.3.2.1.

**Content of policy reference information**. The project or the organization must decide whether this information is required for an individual data module. If so, they must obtain this information from the relevant security authority. Refer to Para 2.2.3.2.3.

**Content of data conditions information**. The project or the organization must decide whether other conditions apply to an individual data module. Refer to Para 2.2.3.2.4.

## 3.10 Responsible partner company

**The use of the optional element and attribute.** As the element <enterpriseName> and the attribute enterpriseCode are both optional, projects must decide on at least one to use and must use it consistently throughout the project. Refer to Para 2.2.5.

**The use of the element <enterpriseName>**. The project or the organization must decide on whether this element is used or not. If used, then its use must be consistent and mandatory for the whole project. Refer to Para 2.2.5.

**Use of the CAGE**. The project or the organization must decide on the use of the optional attribute enterpriseCode to capture the CAGE code and the optional element <enterpriseName> to capture the company name. The company name, if the project decides to use it, is stored in the element <enterpriseName>. This decision point applies to both the originating company and the responsible partner company. Refer to Para 2.2.5.

**A list of permitted CAGE for Responsible Partner Company**. The project or the organization must decide on whether a list of acceptable responsible partner company CAGE codes is created. If the element <enterpriseName> is used, it is recommended that this be included on the list and that the responsible partner company CAGE values and the company name reflect exactly the responsible partner company list given in the business rules. Refer to Para 2.2.5.

## 3.11 Originator

**The use of the optional element and attribute.** The project or the organization must decide on at least one of <enterpriseName> or enterpriseCode to use and must use it consistently throughout the project. Refer to Para 2.2.6.

**Use of the element** <enterpriseName>. The project or the organization must decide on whether the element is used or not. The company name, if the project decides to use it, is stored in the element <enterpriseName>. If used, then its use must be consistent and mandatory for the whole project. Refer to Para 2.2.6.

**A list of allowed CAGE for originator**. The project or the organization must decide on whether a list of acceptable originator company CAGE codes is created. If the element <enterpriseName> is used, it is recommended that this be included on the list and that the originator company CAGE values and the company name reflect exactly the originator company list given in the business rules. Refer to Para 2.2.6.

## 3.12 Technical standard

**The use of the element** <techStandard>. The project or the organization must decide on whether the element is used or not. Refer to Para 2.2.10.

**Authority block values**. The project or the organization must decide on the descriptions of the format of the values in authority block, publications base line and authority exceptions. Refer to Para 2.2.10.2.

**The element** <authorityNotes>. The project or the organization must decide on suitable entries for this element, since the element <authorityNotes> is conditional. Refer to Para 2.2.10.5.

## 3.13 Business rules exchange

**BREXREF**. The project or the organization must decide if it needs to develop project specific business rules and, to that effect, develop its own BREX data module. If sufficient, a project can use the default BREX module that is supplied with each issue of S1000D. The BREX module and related aspects are described in Chap 4.10. Refer to Para 2.2.11.

## 3.14 Quality assurance

**Use of unverified data modules**. The project or the organization must decide on whether unverified data modules can be delivered to the customer. Projects must also consider the impact on issue details. Refer to Para 2.2.12.1.

**Implementation of second verification**. The project or the organization must decide on the requirements for second verification. Refer to Para 2.2.12.3.

**Use of applicability information**. The project or the organization must decide whether to use applicability on QA information. Refer to Para 2.2.12.3.

## 3.15 System breakdown, function item and functional item reference codes

**General use**. The project or the organization must decide on whether or not to use one of the elements <`systemBreakdownCode`>, <`functionalItemCode`>and <`functionalItemRef`>. When deciding the use of these elements projects must establish consistent population. Refer to Para 2.2.13.

## 3.16 Functional item reference

**Use of the attribute `functionalItemNumber` within the element** <`functionalItemRef`>. The project or the organization must decide how attribute `functionalItemNumber` is to be populated when the element <`functionalItemRef`>is used. Refer to Para 2.2.14.

**Use of manufacturer code within the element** <`functionalItemRef`>. The project or the organization must decide if attribute `manufacturerCodeValue` is used and the required contexts, when using the element <`functionalItemRef`>. Refer to Para 2.2.15.

## 3.17 Skill

**The use and definition of the element <`skillLevel`> for training**. The project or the organization must decide whether the data modules carry an indication of the performance level using the project definable available attribute values, as described in Chap 3.9.6.1. If used, it must be applied consistently to all data modules. Refer to Para 2.2.16.

## 3.18 Reason for update

**Use of reason for update**. The project or the organization must decide on defining standard reason for update sentences to be used. Reason for update can be used to automatically generate a highlights data module. Normally, a project will mandate its use from issue "`002`" upwards. Refer to Para 2.2.17.

Examples are:

- Revised to incorporate modification XYZ.
- Deleted. Data module no longer required.

**Use of reason for update in conjunction with the production process**. The project or the organization must decide on whether the element <reasonForUpdate> is to be used during the production process. Refer to Para 2.2.17.

**Use of applicability information**. The project or the organization must decide if it is permitted to differentiate reasons for update depending on Product configuration. Refer to Para 2.2.17.

## 3.19 Product safety

**Use of product safety**. The project must decide whether to use the product safety element and under what circumstances. Refer to Para 2.2.18.

**Definition of safety label attributes**. The project must decide what safety label attributes to use and their definitions. Refer to Para 2.2.18.

## 3.20 Remarks

**Use of the element <remarks>**. The project or the organization must decide on the use of this element. Be aware that remarks made will appear in the delivered data module, unless removed. The element <remarks> is optional and projects must define its use in the business rules and guidance on its content. Refer to Para 2.2.19.

**Use of applicability information**. The project or the organization must decide if it is permitted to differentiate general remarks depending on Product configuration. Refer to Para 2.2.19.

## 1 General

This chapter contains information and guidance on the use of export controls. These controls are required to contain a statement regarding the regulations that apply to the data contained within a data module. The controls also contain an indicator that shows which government gives authority to the regulations defined. This information can be required by companies, government departments and their delivery systems to control the release of data to authorized users. In addition it can be required by authorized users so they can further control transmittal and use of the data, as required by many export control regulations.

When using export controls, projects must consider the statutory requirements of their government and the end data users and their data management requirements. Other items to consider are the display of this data within the user interface. Projects are responsible for ensuring that the export controls applied are correct for the data content and that they comply with the relevant regulations pertaining to export controls.

# 2 Export control

**Description:** This element is used to define any government regulations concerning access to the data module.

**Markup element:** <exportControl> (O)

**Attributes:**

- id (O), the identifier of the <exportControl> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1
- exportRegulationType (O), the identification of the regulation type that governs the use of the data contained in the data module
- governmentAuthority (O), the identification of the government that controls the use of the data contained in the data module. It is recommended to use the two character country code as defined in International Standards Organisation (ISO) 3166-1
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <exportRegistrationStmt> (C), Refer to Para 2.1.
- <exportRegistrationCode> (O), Refer to Para 2.2.

**Business rules decisions:**

- None identified

**Markup example:**

```
<exportControl exportRegulationType="EAR">
...
</exportControl>
```

## 2.1 Export statement

**Description:** This element is used to specify either a full or partial export control statement describing the export status of the data module content.

**Markup element:** <exportRegistrationStmt> (C)

**Attributes:**

- exportRole (O), the description of whether this statement is a full statement or partial statement. Valid values are:
  - "full"
  - "partial"

**Child elements:**

- <simplePara> (O), Refer to Chap 3.9.5.2.1.10
- <dmRef> (O), Refer to Chap 3.9.5.2.1.2

**Note**

The content of the statement is made up of a choice of a combination of multiple instances of the child elements.

**Business rules decisions:**

– None identified

**Markup example:**

```
<exportRegistrationStmt exportRole="partial">
This information contains technology controlled under EAR.
Transfer of this data to a Foreign Person without Export
approval is expressly prohibited.
</exportRegistrationStmt>
```

## 2.2 Export registration code

**Description:** This element is used to indicate a coded value representing an export control property that applies to the content of the data module.

**Markup element:** <exportRegistrationCode> (O)

**Attributes:**

– exportRegulationCodeType (O), this attribute defines the type of the regulation code. In the case of Export Administration Regulations (EAR), the value of the attribute can be "ECCN". In the case of International Traffic in Arms Regulations (ITAR), the value can relate to a program code related to the Project.

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<exportRegistrationCode exportRegulationCodeType="ECCN">
1E001
</exportRegistrationCode>
```

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use of export control**. The project or organization must decide whether export control regulations apply. Refer to Para 2.

# 4 Examples

The following example shows an example of an export control statement:

```
<exportControl exportRegulationType="EAR">
<exportRegistrationStmt exportRole="partial"> This information
contains technology controlled under EAR. Transfer of this data
to a Foreign Person without Export approval is expressly
prohibited.</exportRegistrationStmt>
<exportRegistrationStmt exportRole="full">Export of this
technology is controlled under the United States Export
Administration Regulations (EAR) (15 CFR 730-774). An export
license may be required before it is used for development,
production or use by foreign persons from specific countries.
The controller of this data has the individual responsibility to
abide by all export laws.</exportRegistrationStmt>
```

```
<exportRegistrationCode
exportRegulationCodeType="ECCN">1E001</exportRegistrationCode>
<exportRegistrationCode
exportRegulationCodeType="ECCN">5A101</exportRegistrationCode>
<exportRegistrationCode
exportRegulationCodeType="ECCN">9A991</exportRegistrationCode>
</exportControl>
```

## 1 General

The S1000D Schemas provide the capability to capture operator, maintenance and training content.

## 2 Content section

The content section of a data module must be structured in accordance with one of the following information types:

- Descriptive information, refer to Chap 3.9.5.2.2
- Procedural information, refer to Chap 3.9.5.2.3
- Fault isolation information, refer to Chap 3.9.5.2.4
- Maintenance planning information, refer to Chap 3.9.5.2.5
- Crew/Operator information, refer to Chap 3.9.5.2.6
- IPD information, refer to Chap 3.9.5.2.7
- Battle damage assessment and repair information (to be included in a future change), refer to Chap 3.9.5.2.8
- Wiring data, refer to Chap 3.9.5.2.9
- Process data module, refer to Chap 3.9.5.2.10
- Technical information repository data module, refer to Chap 3.9.5.2.11
- Container data module, refer to Chap 3.9.5.2.12
- Learning data module, refer to Chap 3.9.5.2.13
- Maintenance checklists and inspections, refer to Chap 3.9.5.2.14

Among these information types there are many common constructs. These are described in Chap 3.9.5.2.1.

# 1 General

The content of a data module must be structured in accordance with the appropriate Schema and must be authored in line with the requirements given in the following:

- warnings cautions and notes (refer to Chap 3.9.3)
- security classification (refer to Chap 3.9.5.1)
- simple paragraph (refer to Chap 3.9.5.1)
- change marking (refer to Chap 3.9.5.2.1.1)
- referencing (refer to Chap 3.9.5.2.1.2)
- lists (refer to Chap 3.9.5.2.1.3)
- captions (refer to Chap 3.9.5.2.1.4)
- titles (refer to Chap 3.9.5.2.1.5)
- tables (refer to Chap 3.9.5.2.1.6)
- figures and foldouts (refer to Chap 3.9.5.2.1.7)
- hotspots (refer to Chap 3.9.5.2.1.8)
- preliminary requirements (refer to Chap 3.9.5.2.1.9)
- paragraphs (refer to Chap 3.9.5.2.1.10)
- controlled content (refer to Chap 3.9.5.2.1.11)
- descriptive information (refer to Chap 3.9.5.2.2)
- procedural information (refer to Chap 3.9.5.2.3)
- fault information (refer to Chap 3.9.5.2.4)
- maintenance planning information (refer to Chap 3.9.5.2.5)
- crew/operator information (refer to Chap 3.9.5.2.6)
- parts information (refer to Chap 3.9.5.2.7)
- battle damage assessment and repair information (refer to Chap 3.9.5.2.8)
- wiring information (refer to Chap 3.9.5.2.9)
- process data module (refer to Chap 3.9.5.2.10)
- technical information repository data module (refer to Chap 3.9.5.2.11)

- container data module (refer to Chap 3.9.5.2.12)
- learning data module (refer to Chap 3.9.5.2.13)
- maintenance checklists and inspections (refer to Chap 3.9.5.2.14)
- applicability (refer to Chap 3.9.5.3)
- training information (refer to Chap 3.9.7)

The rules for the presentation of the text, including tables and figures are given in Chap 6.2 and Chap 6.3.

# 1 General

This chapter gives rules and guidance for the marking of changes within data modules. The rules also apply to other CSDB objects where change markers are available.

General rules for change markings are covered in Para 2.1. Para 2.2 provides the rules that apply to change marking for the reason for update. General rules for marking elements and text as changed are given in Para 2.3. The rules for inserting new elements are given in Para 2.4. Para 2.5 provides rules for deleting elements, and Para 2.6 describes how to mark modifications. Para 2.7 gives specific rules for the marking of changes in tables, Para 2.8 gives the rules for marking changes that apply to warnings and cautions, and Para 2.9 provides the rules that apply to figures.

According to the rules of S1000D, only data modules that are changed can contain change markers. These data modules must have their issue type set to `changed` or `rinstate-changed`. In this chapter, these are referred to as changed data modules (ie data modules that have their issue status marked by setting the attribute `issueType` of the `issueInfo` element that is found within the identification and status section set to the value "`changed`" or "`rinstate-changed`").

# 2 Requirements for change marking

## 2.1 General rules for marking changes

Except when the data module is totally revised or new, all changes, except editorial changes, must be marked, and the Reason For Update (RFU) must be given in the data module's identification and status section. For data modules, the RFU information can be used to automatically generate the highlights data module. When the data module is revised, the RFU must contain the words "totally revised". RFU must not be used on Issue 001 of a data module.

The S1000D change mark model allows changes to be indicated and this is achieved by using elements and attributes provided by the S1000D Schema. Changes are only be marked in data modules that are Issue 002 and above and are of issue type changed

When they are used, change markers must be applied to reflect changes since the last issue of the data module, and not between the in-work issues.

The generated tables of contents that are displayed at the front of a data module (including the list of figures and tables) must not have changes applied or indicated. The author must make sure that there are no cross-references elsewhere in the data module or in other data modules which refer to deleted information. To indicate a change to a mark up element (ie the insertion of a new element, the deletion of an element, or the modification of an element), the factorized method described in Para 2.2 is used. To indicate change at word or sentence level, the element <`changeInline`> is used.

## 2.2 The reason for update

**Description:** The element <reasonForUpdate> contains a reason for update for a data module, and from Issue 002, one or more reasons for update should be captured in the identification and status section. The reason for update is a summary of the changes and / or the reasons for the change made within the data module is explained in Chap 3.2 and Chap 3.9.5.1. A data module can have been updated for a number of reasons. To specify each reason, use a separate <reasonForUpdate> element. For issue 002 and upwards, the reason for update is mandatory, and there must be at least one reason for update that will appear in the highlights data module (this means that at least one <reasonForUpdate> element must have its attribute updateHighlight set to the value "1"). If the data module is of issue type changed, then it must have changes indicated by change elements and attributes.

For changed data modules, the project or the organization can decide to provide a link from the places in the data module where the changes occur to the corresponding reason for update which is given in the status section, and this is achieved by using cross-references.

The Schema provides a cross-reference mechanism that can be applied to a change marked element and the corresponding reason for update. This is achieved through the use of the attribute reasonForUpdateRefIds.

The same reason for update can apply to many different elements (and changed text) by specifying the cross-reference identifier for it on all applicable elements. When a change has been made for different reasons, and each reason has a separate reason for update, the identifiers of each of the reasons must be specified in the element's attribute reasonForUpdateIds (which allows more one or more identifiers to be specified).

Data modules that are not of issue type changed must also have at least one reason for update element if the issue number is greater than "001". For example, revised data modules must have a reason for update value of "Totally revised", and reinstated data modules must contain a reason for the reinstatement. Any data module that is not of issue type changed and has an issue number that is greater than "001" must not have change markings, and this implies that there will be no cross-references to any reason for update element.

The element <reasonForUpdate> is located in the data module's identification and status section (refer to Chap 3.9.5.1), and can contain the optional and repeatable element <simplePara>.

**Markup element:** <reasonForUpdate> (O)

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the reason for update element. Refer to Chap 3.9.5.2.1.2.
- updateReasonType (O), this attribute is used to indicate the type of the reason for update that it applies to, and us a configurable attribute (refer to Chap 3.9.6.1). If this attribute is not used, it implies that the change type is technical. The values that follow are predefined in S1000D:
  - "urt01", this value means that the changes are editorial (and therefore there must be no change markers in the data module that relate to this reason for update). There must be no technical changes in a data module that has this value set.
  - "urt02", this value means that the changes are technical, and provided that the data module is not totally revised (refer to Chap 3.9.5.1), there must be change markers that relate to this reason for update.

- "urt03", this means that the changes are related to mark up only and if these changes affect the technical content of the data module, and the data module is of issue type changed, the changes that relate to this reason for update must be marked.
- "urt04", this means that the changes are to applicability markings only and if these changes do not affect the technical content (or the issue type is not changed), then there must be no change markings in the data module that relate to this reason for update.

**Note**

The value of the attribute issueType of the element <issueInfo> must be set in accordance with the rules given in Para. 2. If there are over a certain percentage of changes (where the percentage is set by the project or the organization (in their business rules documentation) (refer to Chap 3.9.5.1), then the issueType attribute must be set to the value revised and if the changes affect the technical content of the data module, the changes that relate to this reason for update must be marked.

– updateHighlight (O), if this attribute is set to the value "1", this indicates that the reason for update must appear in the highlights data module. If the attribute is not used or its value is "0", it means that the reason for update must not appear in the highlights data module.

**Child elements:**

A reason for update can either contain text, or it can contain the element that follows:

– <simplePara> (O), which allows a single reason for update to contain multiple paragraphs, which can contain text and optional super- or sub-scripts. Refer to Chap 3.9.5.2.1.10.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– use of the cross-reference method for the reason for update
– format of reason for update identifiers
– definition of project specific change types
– standard statements for reason for update
– use of reason for update
– use of reason for update in conjunction with the production process
– use of applicability information
– types of changes to mark up

**Markup example:**

```
<reasonForUpdate updateReasonType="urt01" updateHighlight="1"
id="rfu-001">
<simplePara>CPF 2006-47AA: Applicability structure change and
addition of actref element</simplePara>
</reasonForUpdate>
<reasonForUpdate updateReasonType="urt01" updateHighlight="1"
id="rfu-002">
<simplePara>CPF 2006-48AA: Export control structure change,
addition of container elements</simplePara>
</reasonForUpdate>
```

## 2.3 Marking elements and text as changed

### 2.3.1 General rules for both elements and text

When a data module is of type changed, then all change specifications that apply to the data module must have a corresponding reason for update (refer to Para 2.2). For projects or organizations that are using the cross-reference to reason for update method, at the location where a specific change applies, the change is indicated by a reference to the appropriate reason for update which is located in the data module or publication module identification and status section. A change can be made to a data module for different reasons; therefore a change marker can reference multiple reasons for update.

### 2.3.2 Rules for marking elements as changed

**Description:** The change attributes detailed below are used when an element has been added, deleted or modified, and the data module is of type changed.

The changes are hierarchical in nature. This means that if, for example, the element <`proceduralStep`> is added, its change marks also apply to any contained elements (eg the element <`figure`>, the element <`table`>, etc). The contained elements can also have their change marker attributes applied, but this is not mandatory. If they are there, they are to be ignored.

**Markup element:** All elements that contain the attributes that follow.

**Attributes:**

- `changeMark` (O), a value of "`1`" for this attribute indicates that a change bar or mark (or some other visual representation) is to be displayed next to the entire content of an element being added, deleted or modified. A value of "`0`" or if the attribute is not used, means that the change, although marked, is not to be physically indicated by a change bar.
- `changeType` (M), this attribute is used to specify the type of the change (ie "`add`", "`modify`" or "`delete`") (refer to Para 2.4 for details about the decision to mark deletions in a data module). If this attribute is not used, and the attribute `changeMark` is used, the change will be assumed to be an addition.
- `reasonForUpdateRefIds` (O), this attribute must be used when the cross-reference method as described in Para 2.2 is used by the project or the organization. if specific reasons for update apply to the change that is to be indicated for this element, then the values of the `id` attribute for all applicable <`reasonForUpdate`> elements must be given in this attribute.

**Business rules decisions:**

- None identified

### 2.3.3 General rules for marking text as changed

**Description:** The element <`changeInline`> must be used for changed data modules when changing parts of text within certain elements (eg paragraphs, titles etc) that contain the <`changeInline`> element.

The element <`changeInline`> must not be used to indicate that a complete element has been inserted (or modified) as shown in the incorrect markup example below.

**Markup element:** <`changeInline`> (O)

**Attributes:**

- `id` (O), the identifier of the change inline element. Refer to Chap 3.9.5.2.1.2.

- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Para 2.3.2.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <`functionalItemRef`> (O). Refer to Chap 3.9.5.2.1.10
- <`circuitBreakerRef`> (O). Refer to Chap 3.9.5.2.1.10
- <`controlIndicatorRef`> (O). Refer to Chap 3.9.5.2.1.10
- <`inlineSignificantData`> (O). Refer to Chap 3.9.5.2.1.10
- <`quantity`> (O). Refer to Chap 3.9.5.2.1.10
- <`zoneRef`>* (O). Refer to Chap 3.9.5.2.1.10
- <`accessPointRef`>* (O). Refer to Chap 3.9.5.2.1.10
- <`identNumber`>* (O). Refer to Chap 3.9.5.2.1.10
- <`internalRef`> (O). Refer to Chap 3.9.5.2.1.2
- <`indexFlag`>* (O). Refer to Chap 3.9.5.2.1.10
- <`changeInline`> (O). Refer to Chap 3.9.5.2.1.1
- <`emphasis`> (O). Refer to Chap 3.9.5.2.1.10
- <`symbol`> (O). Refer to Chap 3.9.5.2.1.10
- <`subScript`> (O). Refer to Chap 3.9.5.2.1.10
- <`superScript`> (O). Refer to Chap 3.9.5.2.1.10
- <`dmRef`> (O). Refer to Chap 3.9.5.2.1.2
- <`pmRef`>* (O). Refer to Chap 3.9.5.2.1.2
- <`externalPubRef`> (O). Refer to Chap 3.9.5.2.1.2
- <`footnote`> (O). Refer to Chap 3.9.5.2.1.10
- <`footnoteRef`>* (O). Refer to Chap 3.9.5.2.1.10
- <`acronym`> (O). Refer to Chap 3.9.5.2.1.10
- <`acronymTerm`> (O). Refer to Chap 3.9.5.2.1.10
- <`caption`>* (O). Refer to Chap 3.9.5.2.1.4
- <`captionGroup`>* (O). Refer to Chap 3.9.5.2.1.4
- <`verbatimText`> (O). Refer to Chap 3.9.5.2.1.10
- <`sequentialList`> (O). Refer to Chap 3.9.5.2.1.3
- <`randomList`> (O). Refer to Chap 3.9.5.2.1.3
- <`definitionList`> (O). Refer to Chap 3.9.5.2.1.3

**Note**

The elements marked with an asterisk (*) are not available in all data modules. Refer to Chap 3.9.5.2.1.10.

**Business rules decisions:**

- None identified

**Markup example:**

The first example shows incorrect markup. It shows markup that is being incorrectly used to indicate that a procedural step has been inserted. The correct mark up is shown in the second example.

The example that follows shows the correct method to be used to indicate that a procedural step has been added. It also shows how to use the cross-reference method to refer to a reason for the change. The example shows the reason for update is a technical change (because the

updateReasonType is set to the value "urt02"), it is to appear in the highlights data module (because the updateHighlight attribute is set to "1").

```
<proceduralStep changeType="add" reasonForUpdateRefIds="rfu-0005
rfu-0006" changeMark="1">
<para>Remove the four bolts (<internalRef internalRefId="SP0232"
internalRefTargetType="spares"></internalRef>).</para>
</proceduralStep>
```

The two corresponding reason for update entries in the identification and status section could be:

```
<reasonForUpdate id="rfu-0005" updateReasonType="urt02"
updateHighlight="1">
<simplePara>Updated to include the requirements of Brook Trekker
Modification PO-RT1/ON (extended length bottom-bracket shaft
bolts).</simplePara>
</reasonForUpdate>
```

```
<reasonForUpdate id="rfu-0006" updateReasonType="urt02"
updateHighlight="1">
<simplePara>Updated to include the requirements of Brook Trekker
Modification ME-BABB/1E-BCFC (bottom-bracket shaft bolts replace
welds).</simplePara>
</reasonForUpdate>
```

The example that follows shows that the number of bolts has been changed. There is no reasonForUpdateRefIds attribute used because, in this example, the project or the organization has decided to apply the business rule that the cross-reference method described in Para 2.2 is not to be used.

```
<proceduralStep>
<para>Remove the <changeInline changeType="modify"
changeMark="1">four</changeInline> bolts (<internalRef
internalRefId="SP0232"
internalRefTargetType="spares">></internalRef>.</para>
</proceduralStep>
```

The two corresponding reason for update entries in the identification and status section could be:

```
<reasonForUpdate updateHighlight="1" updateReasonType="urt02">
<simplePara>Updated to include the requirements of Brook Trekker
Modification OW/B1ST (Four bolt system).</simplePara>
<simplePara>The bolts are changed to self-locking double hexagon
head (part number WURZ31) in accordance with Mod. ATEY0-
1</simplePara>
</reasonForUpdate>
```

## 2.4 Marking insertions

To mark added elements, use the attribute changeMark with a value "add" To mark text added within existing text, use the element <changeInline> and set its changeType attribute to the value "add". In both cases, if the cross-reference method described in Para 3 is used, use the reasonForUpdateIds attribute as appropriate.

### 2.4.1 Marking inserted elements

**Description:** To mark an element as inserted, set its change attributes as appropriate (refer to Para 2.3.3). The `changeType` attribute must be set to the value "`add`".

There is no need to set the change attributes on the element's child because this is implied. Any change markings on child are ignored by the presentation system.

**Markup elements:** these rules apply to all elements that contain the change mark attributes that are described in Para 2.3.3.

**Attributes:**

– The change attributes must be set as described in Para 2.3.3. The attribute `changeType` must be set to the value "`add`".

**Business rules decisions:**

– None identified

**Markup example:**

The example that follows shows an added element <`proceduralStep`>. The change mark attributes settings on this element imply that the child element <`para`>, the two child elements <`proceduralStep`> and the element <`figure`> have also been added. In this example, a reference to a reason for update is shown as a technical change.

```
<proceduralStep reasonForUpdateRefIds="rfu-0006" changeMark="1">
<para>This is a new step</para>
<proceduralStep>
<para>This is a sub-step</para>
</proceduralStep>
<proceduralStep>
<para>This is a sub-step</para>
<figure>
<title>LP Compressor removal details</title>
<graphic infoEntityIdent="ICN-E2-A-723200-R-K0378-01234-A-01-1">
</graphic>
</figure>
</proceduralStep>
</proceduralStep>
```

The corresponding change specification is the status section would show that this is a technical change as indicated by the attribute `updateReasonType` value "`urt02`", and the reason for update will appear in the highlights data module because the attribute `updateHighlight` is set to the value "`1`".

```
<reasonForUpdate id="rfu-0006" updateReasonType="urt02"
updateHighlight="1">
<simplePara>Incorporation of mod XYZ</simplePara>
</reasonForUpdate>
```

**Note**

For formatting, the change bar (or other visible recognition) is applied to the complete content of the element <proceduralStep> as shown below. This layout applies to changes that are modifications as well.

**1. This is a new step**
**1.1 This is a sub-step**
**1.2 This is a sub-step**
**(graphic appears here)**
**Fig 2 - LP Compressor removal details**

### 2.4.2 Marking inserted text (for example, within a paragraph)

**Description:** The element <changeInline> is used to mark inserted text. If a cross-reference to a reason for update is required, its attribute reasonForUpdateRefIds must refer to an appropriate element <reasonForUpdate>. For inserted text, the attribute changeType must be set to the value "add".

**Markup element:** <changeInline> (O)

**Attributes:**

– The change attributes must be set as described in Para 2.3.3

**Child elements:**

– As described in Para 2.3.3

**Business rules decisions:**

– None identified

**Markup example:**

The example that follows shows that the torque value has been added. In this example, a reference to a reason for update is applied. The change will be marked by a change bar (or other visual representation) because the changeMark attribute is set to the value "1"

```
<proceduralStep>
<para>Use the
<internalRef internalRefId="seq-0001"
internalRefTargetType="supequip">wrench</internalRef>
to tighten the bolts
<changeInline changeType="add" reasonForUpdateRefIds="rfu-0007"
changeMark="1">to 16 lb/sq in
<superScript>2</superScript>
</changeInline>.
</para>
</proceduralStep>
```

The corresponding change specification is the status section shows that this is a technical change as indicated by the reasonType attribute value "urt02". The reason for update will appear in the highlights data module because the attribute updateHighlight is set to the value "1".

```
<reasonForUpdate id="rfu-0007" updateReasonType="urt02"
updateHighlight="1">
<simplePara>The torque value is added</simplePara>
</reasonForUpdate>
```

## 2.5 Marking deletions

### 2.5.1 Definition

S1000D strongly recommends that a project physically removes deleted information from a data module. If a project decides to mark up deleted information, then the rules in this paragraph must be applied. Note that even if the project or the organization decides not to mark deletions, an indication of what has been deleted and a reason for the deletion must be specified in a reason for update for data modules that are of issue type changed.

If deleted markers are required by the project or the organization, then S1000D recommends that the deleted elements and text are not rendered for formatting.

S1000D defines writing rules. There is a risk that some of these can be broken due to deleted information being present. For example, normal writing practice is to use two subordinate steps when a step is further broken down. This rule could be compromised if the second substep is deleted.

To mark deleted elements, use the attribute `changeType` with a value set to "`delete`". Refer to Para 2.4.1. To mark deleted text, use the element <`changeInline`> as described above, with its attribute `changeType` attribute set to "`delete`". Refer to Para 2.4.2.

### 2.5.2 Marking deleted elements

**Description:** The attribute `changeType` on the deleted element must be set to the value "`delete`".

The content of the element that contains the deleted change mark attribute must be preserved.

If an element's parent element is marked as deleted, this implies that its child elements are also deleted. Marking the element's subelements as deleted is therefore not required. Any change markings on subelements are to be ignored by the formatting system.

For data modules, the author must make sure that there are no cross-references elsewhere in the data module or in other data modules which refer to deleted information.

**Markup elements:** all that contain the change mark attributes that are described in Para 2.3.3.

**Attributes:**

– The change attributes must be set as described in Para 2.3.3. The attribute `changeType` must be set to the value `delete`.

**Child elements:**

– As described in Para 2.3.3

**Business rules decisions**

Business rules decisions include, but are not limited to, the following:

– marking deletions
– rendering deleted information

**Markup example:**

In the example that follows the second sub-step element <`proceduralStep`> and its contained element <`table`> have been deleted.

```
<proceduralStep>
<para>This is a step.</para>
<proceduralStep>
<para>This is a sub-step.</para>
```

```
</proceduralStep>
<proceduralStep reasonForUpdateRefIds="rfu-0008" changeMark="0"
changeType="delete">
<para>This is a deleted sub-step.</para>
<table>...</table>
</proceduralStep >
<proceduralStep>
<para>This is another sub-step.</para>
</proceduralStep>
</proceduralStep>
```

The corresponding change specification in the status section would show:

```
<reasonForUpdate id="rfu-0008" updateReasonType="urt02"
updateHighlight="1">
<simplePara>Step XX and table YY are deleted</simplePara>
</reasonForUpdate>
```

### 2.5.3 Marking text as deleted

**Description:** To mark the text within an element as deleted, use the element <changeInline> with the attribute changeType set to the value delete.

When marking text as deleted, the content of the deleted text must be preserved.

**Markup element:** <changeInline> (O)

**Attributes:**

– The change attributes must be set as described in Para 2.3.3. The attribute changeType must be set to the value "delete".

**Child elements:**

– As described in Para 2.3.3

**Business rules decisions**

Business rules decisions include, but are not limited to, the following:

– marking deletions
– rendering deleted information

**Markup example:**

The example that follows shows that a reference to a data module and the reference has been deleted.

```
<levelledPara><para>The values displayed on the HUD are 1,2,3 or
4.
<changeInline reasonForUpdateRefIds="rfu-0009" changeMark="0"
changeType="delete"> Full details are given in
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="E2" systemDiffCode="A"
systemCode="15" subSystemCode="0" subSubSystemCode="1"
assyCode="00" disassyCode="00" disassyCodeVariant="A"
infoCode="043" infoCodeVariant="A" itemLocationCode="D"/>
</dmRefIdent>
</dmRef>.</changeInline>
</para></levelledPara>
```

The corresponding change specification in the status section would show:

```
<reasonForUpdate id="rfu-0009" updateReasonType="urt02"
updateHighlight="1">
<simplePara>The reference to data module E2-A-15-01-00-00A-043A-
D is deleted.</simplePara>
</reasonForUpdate>
```

## 2.6 Marking modified (amended) information

### 2.6.1 Definition

To mark modified elements, use the attribute `changeMark` and set the attribute `changeType` to the value "`modify`" on the modified element. Refer to Para 2.5.2.

To mark text modified within existing text, use the element <`changeInline`> and set its attribute `changeType` to the value `modify`. Refer to Para 2.5.3.

### 2.6.2 Marking modified elements

**Description:** To mark an element as modified, the attribute `changeType` is set to the value "`modify`".

Marking the element's subelement's attribute `changeType` to the value "`modify`" is not required since this is implied. Any change markings on subelements are ignored by the processing system.

**Markup elements:** these rules apply to all elements that contain the change mark attributes that are described in Para 2.3.3.

**Attributes:**

– The change attributes must be set as described in Para 2.3.3. The attribute `changeType` must be set to the value "`modify`".

**Child elements:**

– As described in Para 2.3.3

**Markup example:**

The example that follows shows that the element <`proceduralStep`> has been modified.

```
<proceduralStep reasonForUpdateRefIds="rfu-0010" changeMark="1"
changeType="modify">
<para>This is a modified step</para>
<proceduralStep>
<para>This is a contained sub-step</para>
</proceduralStep>
<proceduralStep>
<para>This is another contained sub-step</para>
</proceduralStep>
</proceduralStep>
```

The corresponding change specification in the identification and status section would show:

```
<reasonForUpdate id="rfu-0010" updateReasonType="urt02"
updateHighlight="1">
<simplePara>The step xxx is modified</simplePara>
</reasonForUpdate>
```

The example that follows shows that the complete text in the element <para> has been modified.

```
<levelledPara>
<para reasonForUpdateRefIds="rfu-0012" changeMark="1"
changeType="modify">Mike from Russia to Mike from Poland:
Hello!</para>
<para>This is continued text</para>
</levelledPara>
```

The corresponding change specification is the status section would show:

```
<reasonForUpdate id="rfu-0012" updateReasonType="urt02"
updateHighlight="1">
<simplePara>The text in the first paragraph of Para xxx is
modified in accordance with technical note MDOM-
E0N.</simplePara>
</reasonForUpdate>
```

### 2.6.3 Marking modified text

**Description:** To mark the text within an element as modified, use the element <changeInline> with the attribute changeType set to the value "modify".

**Markup element:** <changeInline> (O)

**Attributes:**

– The change attributes must be set as described in Para 2.3.3. The attribute changeType must be set to the value" modify".

**Child elements:**

– As described in Para 2.3.3

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– use of the value "modify"

**Markup example:**

This example shows that a torque value within a procedural step has been modified. It is a technical change and the updateReasonType attribute on element <reasonForUpdate> has been set to indicate this.

```
<proceduralStep>
<para>Use the
<internalRef internalRefId="seq-0001"
internalRefTargetType="supequip">wrench</internalRef>
to tighten the bolts to
<changeInline reasonForUpdateRefIds="rfu-0011" changeMark="1"
changeType="modify">18 lbf/in
<superScript>2</superScript>
</changeInline>.
</para>
</proceduralStep>
```

The corresponding change specification is the status section would show:

```
<reasonForUpdate id="rfu-0011" updateReasonType="urt02"
updateHighlight="1">
<simplePara>The torque value is changed to 18 lbf/in
<superScript>2</superScript>.
</simplePara>
</reasonForUpdate>
```

## 2.7 Special rules for indicating change in tables

Change markings, when applied to a table that is marked up with the element `<table>`, must be displayed against the whole table and not individual rows and columns. To achieve this, projects are advised to mark changes within tables by applying the change mark attributes to individual rows and entries. The stylesheet is then able to apply the physical change marking against the whole table by examining the elements and attributes within it.

These rules apply also to tables within foldouts.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– display of change markings in tables

### 2.7.1 Marking inserted, deleted or modified table rows

To mark a table row as being inserted, apply the change mark attributes to the affected row.

**Markup example:**

The following example, a row that has been added (the attribute `changeType` of an element `<reasonForUpdate>` set to the value "`add`").

```
<row reasonForUpdateRefIds="rfu-0021" changeMark="1"
changeType="add">
<entry><para>A</para></entry>
<entry><para>Bike spoke kit</para></entry>
</row>
```

The corresponding change specification is the status section would show:

```
<reasonForUpdate id="rfu-0021" updateReasonType="urt02"
updateHighlight="1">
<simplePara>The third table row is added</simplePara>
</reasonForUpdate>
```

### 2.7.2 Marking changes within table cells (entries)

Tables are changed when you add, modify or delete entries from a table. The Schema does not allow the author to mark that a table entry has been added or modified. To do this, apply the change markers to the subelements of the element `<entry>`. To indicate that elements have been inserted or modified within an entry, use the change attributes for the affected elements as described above. To indicate changes, within the text of an element, use the element `<changeInline>` as described in Para 2.3.3.

## 2.8 Special rules for indicating changes in Warnings and Cautions

It is vital that the user reads a complete warning and caution when performing the maintenance task. Therefore, change marks should be applied to the complete warning or caution and not to individual words or paragraphs that it contains.

### 2.8.1 Markup example:

The following example shows how to markup a warning that has changed.

```
<warning changeMark="1" changeType="modify"
reasonForUpdateRefIds="rfu-0022">
<warningAndCautionPara>Do not drink the oil or allow it to spill
on your skin. It can kill you.</warningAndCautionPara>
</warning>
```

The corresponding change specification is the status section would show:

```
<reasonForUpdate id="rfu-0022" updateHighlight="1"
updateReasonType="urt02">
<simplePara>Warning changed in accordance with the new
requirements of HAZMAT001.</simplePara>
</reasonForUpdate>
```

## 2.9 Special rules for indicating change in figures

The project or the organization must decide to mark changes against an entire figure or against its sheets.

If the element <figure> is to be change marked, the change attributes on the element <graphic> of multi-sheet figures must not be used. This does not prevent the use of the element <reasonForAmendment> on a single illustration sheet of multi-sheet figures to indicate changes in the illustration itself (refer to Para 2.8.1).

If change marking is to be indicated on individual illustration sheets of a multi-sheet figure, then the appropriate change marker attributes must be applied to the element <graphic> , and in this case, the change attributes on the element <figure> must not be used.

The status section element <reasonForUpdate> that is referenced by the element <figure> or the element <graphic> is used as described in Para 2.2, and contains general reasons why the figure (or illustration sheet) has been changed, modified or deleted.

**Business rules decisions:**

– **Use of change marking on individual illustration sheets of a multi-sheet figure.** projects must decide if change attributes are allowed on individual illustration sheets of a multi-sheet figure. This decision involves either marking an entire figure as changed (element <figure>), or marking the individual sheets as changed (element <graphic>).

**Markup example:**

This example shows the first method and indicates that a complete figure has been added.

```
<figure id="F023" changeMark="1" changeType="add">
<graphic infoEntityIdent="ICN-E2-A-723200-R-K0378-12345-A-02-
1"></graphic>
</figure>
```

The next example shows the second method and indicates that the figure has had a second sheet added.

```
<figure id="F023">
<graphic infoEntityIdent="ICN-E2-A-723200-R-K0378-12345-A-02-
1"></graphic>

<graphic infoEntityIdent="ICN-E2-A-723200-R-K0378-12395-A-02-1"
```

```
changeMark="1" changeType="add" reasonForUpdateRefIds="rfu-
011"></graphic>
</figure>
```

The corresponding reason for update in the status section might show:

```
<reasonForUpdate id="rfu-011" updateReasonType="urt02"
updateHighlight="1">
<simplePara>Illustration sheet 2 is added (ICN-E2-A-723200-R-
K0378-12395-A-01-1).</simplePara>
</reasonForUpdate>
```

### 2.9.1 Reason for amendment

**Description:** If used, the element <reasonForAmendment> must record the reason for amendment of either a complete figure, or of individual illustration sheets of a multi-sheet figure. This is to be used to indicate changes made to the illustration itself, for example, "location view has been added", or "cross-section view has been added for Mod. XYZ".

If the element <reasonForAmendment> is to be used for multi-sheet figures, then it must be given, and its content will, in general, be different for each affected illustration sheet.

If the element <figure> is change marked, the change attributes on the element <graphic> of multi-sheet figures must not be used. This does not prevent the use of the element <reasonForAmendment> on a single illustration sheet of multi-sheet figures to indicate changes in the illustration itself.

If change marking is to be indicated on individual illustration sheets of a multi-sheet figure, then the appropriate change marker attributes must be applied to the element <graphic> , and in this case, the change attributes on the element <figure> must not be used.

The status section element <reasonForUpdate> that is referenced by the element <figure> or the element <graphic> is used as described in Para 2.2, and contains general reasons why the figure (or illustration sheet) has been changed, modified or deleted.

**Mark up element:** <reasonForAmendment> (O)

**Attributes:**

– applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.

**Child elements:**

– As described in Para 2.3.3

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– relationship between the element <reasonForAmendment> and the element <reasonForUpdate>
– use of standard texts for the reason for amendment

**Markup example:**

The example that follows shows the use of the element <reasonForAmendment>.

```
<figure id="fig007" changeMark="1" changeType="modify"
reasonForUpdateRefIds="rfu-0098">
<graphic infoEntityIdent="ICN-E2-A-723277-R-K0378-34152-A-01-1">
```

```
<reasonForAmendment>Location view modified. Section A-A changed
to include post mod. XYZ conditions.</reasonForAmendment>
</graphic>
</figure>
```

The corresponding change specification in the status section might show:

```
<reasonForUpdate id="rfu-0098" updateHighlight="1"
updateReasonType="urt02">
<simplePara>Figure changed to post-mod. XYZ
standard</simplePara>
</reasonForUpdate>
```

The example that follows shows a multi-sheet figure with each sheet having a separate reason for amendment.

```
<figure id="fig008" changeMark="1" reasonForUpdateRefIds="rfu-
0001">
<graphic infoEntityIdent="ICN-E2-A-723277-R-K0378-34152-A-01-1">
<reasonForAmendment>Location view modified. Section A-A changed
to include post mod. XYZ conditions.</reasonForAmendment>
</graphic>
<graphic infoEntityIdent="ICN-E2-A-723277-R-K0378-34153-A-01-1">
<reasonForAmendment>Location view modified. Section B-B changed
to include post mod. XYZ conditions.</reasonForAmendment>
</graphic>
</figure>
```

The corresponding change specification in the status section might show:

```
<reasonForUpdate id="rfu-0001" updateHighlight="1"
updateReasonType="urt02">
<simplePara>Figure changed to post-mod. XYZ
standard</simplePara>
</reasonForUpdate>
```

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use of the cross-reference method for the reason for update.** The project or the organization must decide whether to use the cross-reference method for linking changes to reasons for update or not. The method used must be applied consistently in the project. Refer to Para 2.2.

**Format of reason for update identifiers.** It is considered good practice to apply meaningful identifiers to id attributes and the project or the organization is advised to define a format in their business rules documentation (for example: `rfu-001`). Refer to Para 2.2.

**Definition of project specific change types.** The project or the organization must decide if any of the project configurable attributes (values "`urt51`" to "`urt99`") are to be used on the `<reasonForUpdate>` element, and apply meanings for them to make sure that they are consistently used in the project. Refer to Para 2.2.

**Standard statements for reason for update.** The project or the organization must consider the use of standard reason for update statements. For example:

– Revised to incorporate the requirements of modification XYZ.

– Deleted because the data module is no longer needed. Refer to Para 2.2.

**Use of reason for update.** Reason for update can be used to automatically generate highlights data module. Normally, a project will mandate its use from issue 002 upwards. This will imply that the reason for update must not be used for issue 001. Refer to Para 2.2.

**Use of reason for update in conjunction with the production process.** The project or the organization must decide if the element <`reasonForUpdate`> is to be used during the production process. Refer to Para 2.2.

**Use of applicability information.** The project or the organization must decide if it is permitted to differentiate reasons for update depending on Product configuration information. Refer to Para 2.2.

**Types of changes to mark up.** The project or the organization must decide if the reason for update types "`urt01`" (editorial), "`urt03`" (mark up) and "`urt04`" (applicability) are to be used. Irrespective of the decision made, all projects must follow the rules that change markers should only be included if the change is a technical change, and editorial changes must not be marked. Further, no change markers must appear if the issue type is not changed. Refer to Para 2.2.

**Use of the `id` attribute on the <`changeInline`> element**. The project or the organization must decide if the id attribute is allowed to be used on the <`changeInline`> element. The purpose of the attribute must be defined and it is considered good practice to define a format o the identifier (refer to Chap 3.9.5.2.1.2). Refer to Para 2.3.3.

**Marking deletions.** The project or the organization must decide if deletions are to be change marked. S1000D strongly recommends that deleted information is physically removed from an up-issued data module, and deleted change markers are not used. If a project decides to mark deletions, the rules given in Para 2.4 must be applied. Refer to Para 2.5.2 and Para 2.5.3.

**Rendering deleted information.** The project or the organization must consider how deleted information is rendered. S1000D recommends that deletions are not rendered and that no change markings appear. Refer to Para 2.5.2 and Para 2.5.3.

**Use of the value "`modify`"**. Use of the value "`modify`" and the value `add` in change markers must be consistent across the project. The rules for use must be specified in the project or the organization's business rules documentation. Refer to Para 2.6.

**Display of change markings in tables.** The project or the organization must decide, if change markings are to be displayed for parts of a table, for page-oriented output, the change is displayed next to the row that contains the change. Refer to Para 2.7.

**Relationship between the element <`reasonForAmendment`> and the element <`reasonForUpdate`>.** The project or the organization must decide if the reason for amendment details for a figure (or the individual illustration sheets of a multi-sheet figure are also reflected in the data module status element <`reasonForUpdate`> and subsequently used in the generation of the highlights data module. Refer to Para 2.9.1.

**Use of standard texts for the reason for amendment.** It is recommended that projects define a standard set of statements for a reason for amendment. Refer to Para 2.9.1.

# 1 General

This chapter gives the rules, definitions and handling of references and cross-references from an author's point of view. It gives the details about the available elements and attributes and how to use and populate them.

The rules for the presentation of references and cross-references in page-oriented publications and IETP are given in Chap 6.2 and in Chap 6.3 respectively.

References are used to direct the reader to another document or to a certain place within the document. Thus, there are two types of references used in S1000D:

- Cross-references - Internal references (eg to other places within the same data module). Refer to Para 2.1.
- References - External references. Refer to Para 2.2 for a general description of the references to other data modules, refer to Para 2.3 for a general description of references to publication modules and, refer to Para 2.4 for a general description of references to other

external documents Refer to Para 2.5 for rules regarding presentation of references in the reference table of the data module. Refer to Para 2.6 for rules regarding use of "inline" references.

# 2 Use of references

## 2.1 Cross-references within a data module

**Description:** The element <`internalRef`> is used to mark up a cross-reference from one point in a data module to another point in the same data module. This is achieved using the normal ID/IDREF mechanism, refer to Para 2.1.1.1.

**Markup element:** <`internalRef`> (O)

ICN-83007-0000000001-001-01

*Fig 1 Element <`internalRef`>*

Hotspot areas within graphics can also be cross-referenced from within a data module and back using the element <`internalRef`>. A graphical hotspot can also point at another graphical hotspot within the same graphic. Refer to Chap 3.9.5.2.1.8 for details.

**Note**

In order to allow more flexibility for element <`internalRef`> in data module text, it can have textual content including sub and super scripts to highlight link anchors to the end user in viewer applications.

Cross-references to eg, paragraphs, steps, figures and tables must be preceded with the captions "Para", "Step", "Fig" and "Table", respectively when presented. For details, refer to Chap 6.2.2.

The author must enter all "separators" like comma [,], spaces [ ], parenthesis [(], [)], "and" and "or".

**Note**

The captions are normally not entered in the data modules when data modules are written, since tools will automatically generate the captions, either by analyzing the reference or by using the attribute `internalRefTargetType`. Also refer to project or organization decisions below.

*Table 2 Cross-references - Examples*

| Cross-reference to | Method of presentation | Note |
|---|---|---|
| Para <`levelledPara`> | Para 3.2.1 (for <`levelledPara`> at third level) | This method is the usual method in documents using sideheads. |
| A number of paragraphs | Para 2.1 and Para 3.4 | |

| Cross-reference to | Method of presentation | Note |
|---|---|---|
| Table | Table 3 | |
| Figure as a whole | Fig 1 | |
| A number of figures as a whole | Fig 1, Fig 3 and Fig 5 | |
| Cross-reference to a callout in a figure | Fig 1 [2] | |
| Cross-reference to several callouts in the same figure | Fig 6 [1], Fig 6 [3], Fig 6 [5] | |

**Attributes:**

- `applicRefId` (O), the applicability information. Refer to Chap 3.9.5.3.
- `internalRefId` (O), the target id, refer to recommendation below.
- `internalRefTargetType` (O), must be used indicate the type of destination of the reference. The following attribute values are available:
  - "`figure`", used when the reference target is a figure
  - "`table`", used when the reference target is a table
  - "`multimedia`", used when the reference target is multimedia (containing one or more objects)
  - "`supply`", used when the reference target is a supply
  - "`supequip`", used when the reference target is support equipment
  - "`spares`", used when the reference target is a spare
  - "`para`", used when the reference target is a paragraph
  - "`step`", used when the reference target is a step
  - "`graphic`", used when the reference target is a graphic
  - "`multimediaobject`", used when the reference target is a single multimedia object
  - "`hotspot`", used when the reference target is a hotspot
  - "`param`", used when the reference target is a parameter
  - "`other`", used when the reference target is something other than listed above
- `referredFragment` (O), is in this context used to cross-refer to item numbers of hotspots in illustrations within the data module. Refer to Chap 3.9.5.2.1.8.
- `targetTitle` (O), used to provide a human-readable label for the link destination, which could be presented after the target identifier (eg "Hub function") or be displayed when for instance the cursor is hovering over the target identifier.
- `xlink:type` (O), specifies the link type, if an XLink link is established. Refer to Chap 7.4.1.1.
- `xlink:href` (O), specifies the link address, if an XLink link is established. Refer to Chap 7.4.1.1.
- `xlink:title` (O), specifies the link title, if an XLink link is established. Refer to Chap 7.4.1.1.
- `xlink:show` (O), specifies the link appearance, if an XLink link is established. Refer to Chap 7.4.1.1.
- `xlink:actuate` (O), specifies the link behavior, if an XLink link is established. Refer to Chap 7.4.1.1.
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.

**Child elements:**

- <subScript> (O). Refer to Chap 3.9.5.2.1.
- <superScript> (O) . Refer to Chap 3.9.5.2.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- extent of cross-referencing
- define the format of the cross-reference attribute id and attribute internalRefId
- use of element <internalRef> in titles
- use of title in the references
- use of the attribute internalRefTargetType

**Markup example:**

The following example shows a cross-reference to a step within the same data module.

```
<internalRef internalRefId="stp-0001"
internalRefTargetType="step">This is a link to another place in
the same data module.</internalRef>
```

The following markup example shows a cross-reference from a paragraph to a figure.

```
<para>Clean the bicycle with water to remove all dirt. Refer to
<internalRef internalRefId="fig-0001"
internalRefTargetType="figure"></internalRef>.</para>
...
<figure id="fig-0001">
<title>Cleaning the bike</title>
<graphic infoEntityIdent="ICN-S1000DBIKE-AAA-D000000-0-U8025-
00502-A-03-1">
</graphic>
</figure>
```

The following markup example shows a cross-reference from a paragraph to a callout in a figure.

```
<para>Clean the bicycle with water to remove all dirt. Refer to
<internalRef internalRefId="fig-0001-gra-0001-hot-0009"
internalRefTargetType="hotspot"></internalRef>
</para>
...
<figure id="fig-0001">
<title>Complete bicycle</title>
<graphic infoEntityIdent="ICN-S1000DBIKE-AAA-D000000-0-U8025-
00536-A-03-1">
<hotspot id="fig-0001-gra-0001-hot-0001"
applicationStructureIdent="hot001" applicationStructureName="1"
hotspotType="CALLOUT"></hotspot>
<hotspot id="fig-0001-gra-0001-hot-0003"
applicationStructureIdent="hot003" applicationStructureName="3"
hotspotType="CALLOUT"></hotspot>
<hotspot id="fig-0001-gra-0001-hot-0009"
applicationStructureIdent="hot009" applicationStructureName="9"
hotspotType="CALLOUT"></hotspot>
</graphic>
</figure>
```

For markup examples of hotspot linking, refer to Chap 3.9.5.2.1.8.

2.1.1.1 Use and function of ID/IDREF references

There are a couple of standardized means to establish links in an XML document. The traditional one is usually referred to as ID/IDREF linking, which is the method used in S1000D to establish links within CSDB text objects, such as data module. These links are defined by use of two attributes

- an attribute of the generic type ID. The attribute is declared/available for elements that are supposed to be targets of a reference/link from some other locations in the data module
- an attribute of either of the generic types IDREF or IDREFS. This type of attribute is declared/available for elements from which there can be a reference/link to some other element(s). The value of an IDREF type attribute must be the value of the ID type attribute of the target element. When there are several potential targets, the attribute type IDREFS is used, which can contain several space separated target IDs.

A link can be representing a cross reference within a data module, such as described in Para 2.1. However, there are a number of possible implicit links in a data module that do not show as cross references. Examples are references from some content location to an applicability annotation located in the status section, or a reference from some location in the data module content to a change note in a element <`reasonForUpdate`>, also located in the status information block.

To enable the various uses of ID/IDREF references/links within the data module, a great number of elements are equipped with an ID type attribute. These are always named `id`.

Since the ID/IDREF mechanism is inherent XML functionality, in most implementations of S1000D, population of the element identities (ie `id` attributes) is cared for automatically. Depending on the type of references (cross reference or others), the behavior of the ID/IDREF references can vary completely. Refer also to Chap 7.4.1.1 and Chap 7.4.

## 2.2 References to data modules

**Description:** The element <`dmRef`> contains details of the destination data module that is referred from some other S1000D context, such as a data module, a publication module etc.

**Markup element:** <`dmRef`> (O)

ICN-83007-0000000002-001-01

*Fig 2 Element <`dmRef`>*

**Attributes:**

- `applicRefId` (O), the applicability information. Refer to Chap 3.9.5.3.
- `id` (O), the identifier of the reference to data module element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

- `referredFragment` (O), contains the identification of an exact target within a data module when a reference addresses a specific location within another data module rather than the whole data module. The target must be an element in the destination data module and the target identification is the `id` attribute of the target element.
- `xlink:type` (O), specifies the link type, if an XLink link is established. Refer to Chap 7.4.1.1.
- `xlink:href` (O), specifies the link address, if an XLink link is established. Refer to Chap 7.4.1.1.
- `xlink:title` (O), specifies the link title, if an XLink link is established. Refer to Chap 7.4.1.1.
- `xlink:show` (O), specifies the link appearance, if an XLink link is established. Refer to Chap 7.4.1.1.
- `xlink:actuate` (O), specifies the link behavior, if an XLink link is established. Refer to Chap 7.4.1.1.
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <`dmRefIdent`> (M), contains the items forming a unique identification of a destination data module. Refer to Para 2.2.1.1
- <`dmRefAddressItems`> (O), contains additional information about the destination data module. Refer to Para 2.2.1.2.
- <`behavior`> (O), specifies how a link corresponding to the reference operates. Refer to Para 2.2.1.3.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use and format of the attribute `referredFragment`

**Markup example:**

The following example shows a reference to another data module including its title and issue number (subelements are described below):

```
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="DA2" subSystemCode="2" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="520" infoCodeVariant="A" itemLocationCode="A" />
<issueInfo issueNumber="002" inWork="00"/>
</dmRefIdent>
<dmRefAddressItems>
<dmTitle>
<techName>Handlebar</techName>
<infoName>Remove procedures</infoName>
</dmTitle>
</dmRefAddressItems>
</dmRef>
```

2.2.1.1 Identification of a referred data module

**Description:** The element <dmRefIdent> contains the items forming a unique identification of the destination data module.

**Markup element:** <dmRefIdent> (M)

ICN-83007-0000000003-001-01

*Fig 3 Element <dmRefIdent>*

**Attributes:**

– None

**Child elements:**

– <identExtension> (O), contains the additional parameters needed to establish a unique identification of a data module in those cases when data module code, issue and in-work numbers together with the language and country are insufficient to form a universally unique identity. Refer to Chap 3.9.5.1 and Chap 4.12.
– <dmCode> (M), contains the data module code of the destination data module. Refer to Chap 3.9.5.1 and Chap 4.3.
– <issueInfo> (O), contains issue information needed to address a particular destination data module issue. Refer to Chap 3.9.5.1.
– <language> (O), specifies the language of the destination data module. Refer to Chap 3.9.5.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– use of issue information and language

**Markup example:**

```
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="DA2" subSystemCode="2" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="520" infoCodeVariant="A" itemLocationCode="A" />
<issueInfo issueNumber="002" inWork="00"/>
</dmRefIdent>
```

2.2.1.2 Complementary identifying information for a data module

**Description:** The element <dmRefAddressItems> contains additional identifying information about the destination data module.

**Markup element:** <dmRefAddressItems> (O)

ICN-83007-0000000004-001-01

*Fig 4 Element <dmRefAddressItems>*

**Attributes:**

– None

**Child elements:**

– <dmTitle> (O), contains the data module title of the destination data module. Refer to Chap 3.9.5.1.
– <issueDate> (O), specifies the issue date of the destination data module. Refer to Chap 3.9.5.1.

**Business rules decisions:**

– Use of title and issue date

**Markup example:**

```
<dmRefAddressItems>
<dmTitle>
<techName>Handlebar</techName>
<infoName>Remove procedures</infoName>
</dmTitle>
</dmRefAddressItems>
```

2.2.1.3 Link behavior information

**Description:** The element <behavior> specifies how the link operates, when a reference is supposed to be realized as a link.

**Markup element:** <behavior> (O)

ICN-83007-0000000005-001-01

*Fig 5 Element <behavior>*

**Attributes:**

– linkShow (O), specifies the link appearance, if an xlink link is established. Refer to Chap 7.4.1.1.

- "newPane", show the referred context in a new pane
- "embedInContext", embed the referred context in the current context
- "replaceAndReturnToSource", show the referred context instead of the current context, and return automatically to the current context when the referred context has been viewed
- "replaceAndNoReturn", show the referred context instead of the current context, but do not automatically return to the current context when the referred context has been viewed

– linkActuate (O), specifies the link behavior, if an XLink link is established. Refer to Chap 7.4.1.1.
  - "onLoad", present the referred context automatically when the link is loaded (ie when the link appears in the currently viewed context)
  - "onRequest", present the referred context on user request only

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

The following example illustrates how to markup a reference/link that will cause the reference target to show in a separate pane on the screen as soon as the link appears in the viewing context.

```
<behavior linkShow="newPane" linkActuate="onLoad"/>
```

## 2.3 References to publications

**Description:** The element <pmRef> contains details of the destination publication module that is referred from some other S1000D context, such as a data module, another publication module etc.

**Markup element:** <pmRef> (O)

ICN-83007-0000000006-001-01

*Fig 6 Element <pmRef>*

**Attributes:**

– applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
– id (O), the identifier of the reference to publication element. Refer to Chap 3.9.5.2.1.2.

- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- xlink:type (O), specifies the link type, if an XLink link is established. Refer to Chap 7.4.1.1.
- xlink:href (O), specifies the link address, if an XLink link is established. Refer to Chap 7.4.1.1.
- xlink:title (O), specifies the link title, if an XLink link is established. Refer to Chap 7.4.1.1.
- xlink:show (O), specifies the link appearance, if an XLink link is established. Refer to Chap 7.4.1.1.
- xlink:actuate (O), specifies the link behavior, if an XLink link is established. Refer to Chap 7.4.1.1.
- authorityName (O), and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <pmRefIdent> (M), contains the items forming a unique identification of a destination publication module. Refer to Para 2.3.1.1.
- <pmRefAddressItems> (O), contains additional information about the destination publication module. Refer to Para 2.3.1.2.
- <behavior> (O), specifies how a link corresponding to the reference operates. Refer to Para 2.2.1.3.

**Business rules decisions:**

- None identified

**Markup example:**

The following example shows a reference to S1000D publication by using element <pmRefIdent> and <pmRefAddressItems> (subelements are described below):

```
<pmRef>
<pmRefIdent>
<pmCode modelIdentCode="S1000DBIKE" pmIssuer="SF518"
pmNumber="00003" pmVolume="00"/>
</pmRefIdent>
<pmRefAddressItems>
<pmTitle>Bike manuals</pmTitle>
<issueDate year="2007" month="02" day="28"/>
</pmRefAddressItems>
</pmRef>
```

2.3.1.1 Identification of a referred publication module

**Description:** The element <pmRefIdent> contains the items forming a unique identification of the destination data module.

**Markup element:** <pmRefIdent> (M)

ICN-83007-0000000007-001-01

*Fig 7 Element <pmRefIdent>*

**Attributes:**

– None

**Child elements:**

– <identExtension> (O), contains the additional parameters needed to establish a unique identification of a data module in those cases when data module code, issue and in-work numbers together with the language and country are insufficient to form a universally unique identity. Refer to Chap 3.9.5.1 and Chap 4.12.
– <pmCode> (M), contains the data module code of the destination data module. Refer to Chap 4.9.1.
– <issueInfo> (O), contains issue information needed to address a particular destination data module issue. Refer to Chap 3.9.5.1.
– <language> (O), specifies the language of the destination data module. Refer to Chap 3.9.5.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– use of issue information and language

**Markup example:**

```
<pmRefIdent>
<pmCode modelIdentCode="S1000DBIKE" pmIssuer="SF518"
pmNumber="00003" pmVolume="00"/>
</pmRefIdent>
```

2.3.1.2 Complementary identifying information for a publication module

**Description:** The element <pmRefAddressItems> contains additional identifying information about the destination publication module.

**Note**

Only the publication module code, the publication module title, and the issue number will be presented in page-oriented publications. Refer to Chap 6.2.2.

**Markup element:** <pmRefAddressItems> (O)

ICN-83007-0000000008-001-01

*Fig 8 Element <pmRefAddressItems>*

**Attributes:**

- `xlink:type` (O) specifies the link type, if an XLink link is established. Refer to Chap 7.4.1.1.
- `xlink:href` (O) specifies the link address, if an XLink link is established. Refer to Chap 7.4.1.1.
- `xlink:title` (O) specifies the link title, if an XLink link is established. Refer to Chap 7.4.1.1.
- `xlink:show` (O) specifies the link appearance, if an XLink link is established. Refer to Chap 7.4.1.1.
- `xlink:actuate` (O) specifies the link behavior, if an XLink link is established. Refer to Chap 7.4.1.1.

**Child elements:**

- <`pmTitle`> (O), contains the publication module title of the destination publication. Refer to Chap 4.9.1
- <`issueDate`> (O), specifies the issue date of the destination data module. Refer to Chap 3.9.5.1
- <`security`> (O), contains the publication module security as described Chap 3.9.5.1
- <`responsiblePartnerCompany`> (O), to give the Responsible Partner Company of the non publication module as described in Chap 3.9.5.1
- <`pubMedia`> (O), contains the media of the publication module as described in Chap 4.9.1
- <`shortPmTitle`> (O), contains an abbreviated alternate publication title corresponding to the <`pmTitle`>. This short form for the publication title is meant to be presented in the narrative of the data module to make the reading easier. Refer to Chap 6.2.2 for presentation.

**Business rules decisions:**

– None identified

**Markup example:**

```
<pmRefAddressItems>
<pmTitle>Bike manuals</pmTitle>
<issueDate year="2007" month="02" day="28"/>
</pmRefAddressItems>
```

## 2.4 References to external documents

**Description:** The element <externalPubRef> contains the identification of a referenced non S10000D publication or document.

**Markup element:** <externalPubRef> (O)

ICN-83007-0000000009-001-01

*Fig 9 Element <externalPubRef>*

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the reference to external document element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- xlink:type (O), specifies the link type, if an xlink link is established. Refer to Chap 7.4.1.1
- xlink:href (O), specifies the link address, if an xlink link is established. Refer to Chap 7.4.1.1
- xlink:title (O), specifies the link title, if an xlink link is established. Refer to Chap 7.4.1.1
- xlink:show (O), specifies the link appearance, if an xlink link is established. Refer to Chap 7.4.1.1
- xlink:actuate (O), specifies the link behavior, if an xlink link is established. Refer to Chap 7.4.1.1
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <externalPubRefIdent> (M), contains the identification of the non S1000D publication or document. Refer to Para 2.4.1.1
- <externalPubRefAddressItems> (O), contains additional information about the destination publication or document. Refer to Para 2.4.1.5
- <behavior> (O), specifies how the link operates by means of two attributes. Refer to Para 2.3.

**Business rules decisions:**

- None identified

**Markup example:**

The following example shows a reference to another technical publication by using the element <pubCode> as free text:

```
<externalPubRef>
<externalPubRefIdent>
<externalPubCode pubCodingScheme="ISBN">9999999999
</externalPubCode>
<externalPubTitle>Effective Cycling</externalPubTitle>
</externalPubRefIdent>
</externalPubRef>
```

2.4.1.1 Identification of an external document

**Description:** The element <externalPubRefIdent> contains the identification of the non S1000D publication or document.

**Markup element:** <externalPubRefIdent> (M)

ICN-83007-0000000010-001-01

*Fig 10 Element <externalPubRefIdent>*

**Attributes:**

- None

**Child elements:**

- <externalPubCode> (O). Refer to Para 2.4.1.2.
- <externalPubTitle> (O). Refer to Para 2.4.1.3.
- <externalPubIssueInfo> (O). Refer to Para 2.4.1.4.1.

**Business rules decisions:**

– None identified

**Markup example:**

```
<externalPubRefIdent>
<externalPubCode pubCodingScheme="ISBN">9999999999
</externalPubCode>
<externalPubTitle>Effective Cycling</externalPubTitle>
</externalPubRefIdent>
```

2.4.1.2 Identifying code of an external document

**Description:** The element <externalPubCode> contains, as text content, a code that identifies a non S1000D document, such as an ISBN code or similar.

**Markup element:** <externalPubCode> (O)

**Attributes:**

– pubCodingScheme (O). Provides a reference to specification of the syntax of the identity given, such as "ISBN".

**Child elements:**

– <indexFlag> (O). Refer to Chap 3.9.5.2.1.10.
– <subScript> (O). Refer to Chap 3.9.5.2.1.10.
– <superScript> (O). Refer to Chap 3.9.5.2.1.10.
– <acronym> (O). Refer to Chap 3.9.5.2.1.10.
– <acronymTerm> (O). Refer to Chap 3.9.5.2.1.10.
– <verbatimText> (O) . Refer to Chap 3.9.5.2.1.10.

**Business rules decisions:**

– None identified

**Markup example:**

```
<externalPubCode pubCodingScheme="ISBN">9999999999
</externalPubCode>
```

2.4.1.3 Title of an external document

**Description:** The element <externalPubTitle> contains, as text content, a code that identifies a non S1000D document, such as an ISBN code or similar.

**Markup element:** <externalPubTitle> (O)

**Attributes:**

– None

**Child elements:**

– <indexFlag> (O). Refer to Chap 3.9.5.2.1.10.
– <subScript> (O). Refer to Chap 3.9.5.2.1.10.
– <superScript> (O). Refer to Chap 3.9.5.2.1.10.
– <acronym> (O). Refer to Chap 3.9.5.2.1.10.
– <acronymTerm> (O). Refer to Chap 3.9.5.2.1.10.
– <verbatimText> (O). Refer to Chap 3.9.5.2.1.10.

**Business rules decisions:**

– None identified

**Markup example:**

```
<externalPubTitle>Effective Cycling</externalPubTitle>
```

2.4.1.4 Issue information of an external document

**Description:** The element <externalPubIssueInfo> contains issue information concerning e referred non S1000D document.

**Markup element:** <externalPubIssueInfo> (O)

**Attributes:**

– None

**Child elements:**

– <externalPubIssue> (O). Refer to Para 2.4.1.4.1.

**Business rules decisions:**

– None identified

**Markup example:**

```
<externalPubIssueInfo>
<externalPubIssue>...</externalPubIssue>
</externalPubIssueInfo>
```

*2.4.1.4.1 Issue information of an external document*

**Description:** The element <externalPubIssue> contains, as text content, issue designation of a non S1000D document.

**Markup element:** <externalPubIssue> (O)

**Attributes:**

– None

**Child elements:**

– <indexFlag> (O). Refer to Chap 3.9.5.2.1.10.
– <subScript> (O). Refer to Chap 3.9.5.2.1.10.
– <superScript> (O). Refer to Chap 3.9.5.2.1.10.
– <acronym> (O). Refer to Chap 3.9.5.2.1.10.
– <acronymTerm> (O). Refer to Chap 3.9.5.2.1.10.
– <verbatimText> (O) . Refer to Chap 3.9.5.2.1.10.

**Business rules decisions:**

– None identified

**Markup example:**

```
<externalPubIssue>...</externalPubIssue>
```

2.4.1.5 Complementary identifying information for an external document

**Description:** The element <externalPubRefAddressItems> contains, as text content, additional information potentially useful to identify the external destination publication or document.

**Note**

Only the publication code, title and date will be presented in page-oriented publications. Refer to Chap 6.2.2.

**Markup element:** <externalPubRefAddressItems> (O)

ICN-83007-0000000011-001-01

*Fig 11 Element <externalPubRefAddressItems>*

**Attributes:**

– None

**Child elements:**

– <issueDate> (O), specifies the issue date of the destination document. Refer to Chap 3.9.5.1
– <security> (O), specifies the external document security as described Chap 3.9.5.1
– <responsiblePartnerCompany> (O), specifies the Responsible Partner Company of the external document as described in Chap 3.9.5.1
– <pubMedia> (O), specifies the media of the external document as described in Chap 4.9.1
– <shortExternalPubTitle> (O), specifies as text content an abbreviated alternate title (of the external document) corresponding to the <externalPubTitle>. This short form for the publication title is meant to be presented in the narrative of the data module to make the reading easier. Refer to Chap 6.2.2 for presentation.

**Business rules decisions:**

– None identified

**Markup example:**

```
<externalPubRefAddressItems>
<issueDate year="2007" month="02" day="28"/>
</externalPubRefAddressItems>
```

## 2.5 References presented in the reference table of a data module

**Description:** The element <refs> is used to populate the standardized tabular list "Table 1 References". This paragraph gives the rules and recommendations for inclusion of the standardized tabular list "Table 1 References" at the beginning of the data module content section.

**Markup element:** <refs> (O)

ICN-83007-0000000012-001-01

*Fig 12 Element <refs>*

Absence of element <refs> indicates that there are no references to other data modules or technical publications.

**Note**

The absence of the element <refs> will be presented in the standardized table References with "None" in the left hand column. Refer to Chap 6.2.2 for presentation rules and examples.

When the element <refs> is used, the referenced data modules, publication modules and non S1000D publications, must be listed in lexical order, with data modules first, publication modules second and non S1000D publications last.

Each referenced data module, document or other publication, must be listed only once in the element <refs>.

References must only be given to a complete document, a complete set of documents or to a complete publication.

When referring to documents or publications without a data module code, the reference must give an appropriate identification of the referred document or publication.

**Attributes:**

– None

**Child elements:**

– <dmRef> (O). Refer to Para 2.2
– <pmRef> (O). Refer to Para 2.3

– <externalPubRef> (O). Refer to Para 2.4

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– population of the element <refs>

**Markup example:**

The following example shows a reference table including a reference to a data module, a publication module and to two non S1000D documents of which one is identified by an ISBN code:

```
<refs>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="DA2" subSystemCode="2" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="520" infoCodeVariant="A" itemLocationCode="A" />
<issueInfo issueNumber="002" inWork="00"/>
</dmRefIdent>
<dmRefAddressItems>
<dmTitle><techName>Handlebar</techName>
<infoName>Remove procedures</infoName>
</dmTitle>
</dmRefAddressItems>
</dmRef>
<pmRef>
<pmRefIdent>
<pmCode modelIdentCode="S1000DBIKE" pmIssuer="SF518"
pmNumber="00003" pmVolume="00"/>
</pmRefIdent>
<pmRefAddressItems>
<pmTitle>Bike manuals</pmTitle>
<issueDate year="2007" month="02" day="28"/>
</pmRefAddressItems>
</pmRef>
<externalPubRef>
<externalPubRefIdent>
<externalPubTitle>Local Disposal Procedures</externalPubTitle>
</externalPubRefIdent>
</externalPubRef>
<externalPubRef>
<externalPubRefIdent>
<externalPubCode pubCodingScheme="ISBN">9999999999
</externalPubCode>

</externalPubRefIdent>
</externalPubRef>
</refs>
```

## 2.6 Inline use of references to other documents

**Description:** This paragraph gives the rules and recommendations for use of element <dmRef>, element <pmRef> and element <externalPubRef> when they are used inline.

Referring to information not contained in the current context is achieved by using the element <dmRef> for data modules, element <pmRef> for publication modules or element

<externalPubRef> for non S1000D publications or documents. The element <dmRef>, element <pmRef> and element <externalPubRef> must be populated as described at Para 3.

References can be made to a part of a data module using the attribute referredFragment in element <dmRef>. However, references to a part of a data module is only allowed into the following data modules, IPD, schedules, technical repositories, as described in Chap 4.13.2, and from training data modules into procedural data modules but only then when the safety case is taken into account Refer to Chap 3.9.7 and Chap 5.2.1.19. See markup example below.

**Note**

Only the data module code and the issue number will be presented in page-oriented publications. Refer to Chap 6.2.2.

**Note**

Only the publication module code (element <pmCode>) will be presented in page-oriented publications. Refer to Chap 6.2.2.

Excessive linking, by references to data modules without real content apart from just another element <dmRef>, must be avoided.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– define words before and after the reference elements

**Markup example:**

The following example shows a reference to another data module, without including the issue number and title.

```
... Refer to
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="DA0" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="041" infoCodeVariant="A" itemLocationCode="A"/>
</dmRefIdent>
</dmRef>
 for a functional ...
```

The following example shows a reference to a data module including the issue number and title.

```
...
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="DA3" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="041" infoCodeVariant="A" itemLocationCode="A"/>
</dmRefIdent>
<dmRefAddressItems>
<dmTitle>
<techName>Frame</techName>
<infoName>Description of how it is made</infoName>
</dmTitle>
</dmRefAddressItems>
```

```
</dmRef>
...
```

The following example shows a reference to paragraph in another data module, without including the issue number and title.

```
<proceduralStep>
<para>Use the
<internalRef internalRefId="seq-0002"
internalRefTargetType="supequip"></internalRef>
from the
<internalRef internalRefId="seq-0001"
internalRefTargetType="supequip"></internalRef>
and attach the new
<internalRef internalRefId="spa-0001"
internalRefTargetType="spares"></internalRef>
to the wheel. Refer to
<dmRef referredFragment="par-0003">
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="DA0" subSystemCode="1" subSubSystemCode="0"
assyCode="20" disassyCode="00" disassyCodeVariant="AA"
infoCode="041" infoCodeVariant="A" itemLocationCode="A"/>
</dmRefIdent>
</dmRef>.</para>
</proceduralStep>
```

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Extent of cross-referencing**. Projects or organizations must decide on the extent of cross-referencing within data modules and the methods used for populating the various attributes. The results of these decisions must be recorded in the project or organization business rules. Refer to Para 2.

**Define the format of the cross-reference attribute `id` and attribute `internalRefId`**. A project or organization can decide that the cross-references must be prefixed by alpha characters that identify the type of element to which is being referred. Example:

- Structure: prefix followed by a hyphen and a four digits number to make it unique within the data module, eg "`par-0001`"
- Prefixes:
  - "`par`" for paragraphs
  - "`stp`" for steps of procedure, fault isolation, etc
  - "`fig`" for figures
  - "`tab`" for tables
  - "`seq`" for support equipment
  - "`spa`" for spares
  - "`sup`" for supplies
  - "`ftn`" for footnotes
  - "`accpnl`" for access points, refer to Chap 3.9.5.2.1.9
  - "`hot`" for hotspots, eg "fig-0001-hot-0002"

**Note**

The four digits number has no connection to, eg the figure or table number. Eg "Fig 1" could be "`fig-0345`". Refer to Para 2.1.

**Use of element <`internalRef`> in titles**. The use of element <`internalRef`> in titles is strongly discouraged. The project or organization must decide if cross-references in titles are to be used. Refer to Para 2.1.

**Use of title in the references**. The project or organization must decide if the titles (attribute `targetTitle`) are to be used. Refer to Para 2.1.

**Use of the attribute `internalRefTargetType`**. Projects or organizations must decide whether to use the attribute `internalRefTargetType`. If projects or organizations do not use the attribute `internalRefTargetType` then the text caption "Fig", "Table", etc, can be entered by the author. Refer to Para 2.1.

**Use and format of the attribute referredFragment of element <`dmRef`>**. Projects or organizations must decide on the use of and list the precautions if it is used. Refer to Para 2.2.

**Use of issue information and language in data module references**. A data module reference can contain issue and in-work numbers, as well as language and country codes. The project or organization must decide if these are to be used or not. In making this decision, the project or organization must be aware of the implications of using the items when referenced data modules are updated. Refer to Para 2.2.

**Use of issue information and language in references to publication modules**. A data module reference can contain issue and in-work numbers, as well as language and country codes. The project or organization must decide if these are to be used or not. In making this decision, the project or organization must be aware of the implications of using the items when referenced data modules are updated. Refer to Para 2.3.

**Use of title and issue date in data module references**. A data module reference can contain title and issue date of the referenced data module. The project or organization must decide if these are to be used or not. Refer to Para 2.2.1.2.

**Population of the element <`refs`>**. Projects or organizations must decide if and how this element is to be populated. If the element is populated, the order of items in the list must be specified in the project business rules. Refer to Para 2.5.

**Define words before and after the element <`dmRef`>, element <`pmRef`> and element <`externalPubRef`>**. This is important as it has implications on the stylesheets used in the IETP. For one implementation, the stylesheet can automatically generate the words eg "Refer to data module:" when it sees the element <`dmRef`>, this will cause problems if the author has written "refer to" within the paragraph before the element <`dmRef`>. Refer to Para 2.6.

# 1 General

This chapter contains the definition and handling of lists from an author's point of view. It gives details about the available elements and attributes for:

- sequential lists
- random lists
- definition lists

ICN-S3627-S1000D0541-001-01

*Fig 1 The* `listElementGroup`

Lists consist of two main parts, a title and the list items. The title is optional.

There must be no full stops after any list items if the items are not full sentences.

# 2 Lists

## 2.1 Sequential lists

**Description:** The element <`sequentialList`> contains sequential lists, which are also known as ordered lists. It can contain applicability information, a title and the list items themselves.

In a sequential list, a list item can consist of one or more paragraphs. A sequential list, when formatted, is numbered with Arabic numerals. Refer to Chap 6.2.2.

Sequential lists must not be used to provide procedural step information.

Only one level of sequential (ordered) lists must be placed under a numbered title or paragraph (subheading).

Sequential lists are limited to a maximum of two levels.

**Note**

Sequential lists are not available in warnings and cautions. Refer to Chap 3.9.3.

**Markup element:** <sequentialList> (O)

ICN-S3627-S1000D0542-001-01

*Fig 2 Element <sequentialList>*

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the <sequentialList> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <title> (O). Refer to Chap 3.9.5.2.1.5.
- <listItem> (C). Refer to Para 2.1.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of the element <title>

**Markup example:**

```
<sequentialList>
<title>
...
</title>
<listItem>
...
</listItem>
</sequentialList>
```

### 2.1.1 List items

**Description:** This element <listItem> is used to contain the list items themselves. It can contain text, or notes and paragraphs.

**Markup element:** <listItem> (M)

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the <listItem> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <note> (O). Refer to Chap 3.9.3.
- <para> (O). Refer to Chap 3.9.5.2.1.10.

**Business rules decisions:**

- None identified

**Markup example:**

```
<listItem>
<note>
...
</note>
<para>
...
</para>
</listItem>
```

### 2.1.2 Sequential lists in warnings and cautions

Refer to Chap 3.9.3 for details of the element <attentionSequentialList>.

## 2.2 Random list

**Description:** The element <randomList> contains random lists. It can contain applicability information, a title and the list items themselves.

There are two types of random lists:

- simple - recognized by the value "pf01" of the attribute prefix
- unordered - the lists recognized by the default value "pf02" of the attribute prefix giving the following default sequence of prefix: [-][●][-]

The difference between a simple random list and an unordered random list is in the presentation. Refer to Chap 6.2.2.

Each list item, on any level, can consist of one or more paragraphs.

**Markup element:** <randomList> (O)

**Attributes:**

- Includes the same set of attributes as the element <seqentialList>. Refer to Para 2.1, and
- listItemPrefix (O), this element is used to indicate whether the list is a simple list or an unordered list. This attribute can have the following values:
  - "pf01" - "pf99" where "pf02" is the default value. Refer to Chap 3.9.6.1.

**Child elements:**

- <title> (O). Refer to Chap 3.9.5.2.1.5.
- <listItem> (C). Refer to Para 2.1.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of the element <title>
- use of the attribute listItemPrefix

**Markup example:**

```
<randomList>
<title>
...
</title>
<listItem>
...
</listItem>
</randomList>
```

### 2.2.1 Random list in warnings and cautions

Refer to Chap 3.9.3 for details of the element <attentionRandomList>.

### 2.2.2 Random lists in notes

Refer to Chap 3.9.3 for details of the element <attentionRandomList>.

## 2.3 Definition list

**Description:** The element <definitionList> contains a list of terms and definitions. It can contain applicability information, a title and a definition list header. The body of the definition list comprises one or more definition list items, each containing a term and its definition.

It is possible to have more than one paragraph in a definition.

When formatted the definition list is presented as a two column table that contains terms and definitions. Examples for use are definition of terms and legends. Refer to Chap 6.2.2.

**Note**

Definition lists are not available in warnings, cautions and notes. Refer to Chap 3.9.3.

**Markup element:** <definitionList> (O)

ICN-S3627-S1000D0543-001-01

*Fig 3 Element <definitionList>*

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the < definitionList> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <title> (O). Refer to Chap 3.9.5.2.1.5.
- <definitionListHeader> (O). Refer to Para 2.3.1.
- <definitionListItem> (C). Refer to Para 2.3.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of the element <title>
- use of the element <definitionListHeader>

**Markup example:**

```
<definitionList>
<title>
...
</title>
<definitionListHeader>
...
```

```
</definitionListHeader>
<definitionListItem>
...
</definitionListItem>
</definitionList>
```

### 2.3.1 Definition list headers

**Description:** The element <`definitionListHeader`> contains the column header of the definition list. It can contain the term title and the definition title.

**Markup element:** <`definitionListHeader`> (O)

**Attributes:**

– None

**Child elements:**

– <`termTitle`> (C). The column title for the terms. Refer to Para 2.3.1.1.
– <`definitionTitle`> (C). The column title for the definition. Refer to Para 2.3.1.2.

**Business rules decisions:**

– None identified

**Markup example:**

```
<definitionListHeader>
<termTitle>
...
</termTitle>
<definitionTitle>
...
</definitionTitle>
</definitionListHeader>
```

#### 2.3.1.1 Term title

**Description:** The element <`termTitle`> contains the column title for the term.

**Markup element:** <`termTitle`> (C)

**Attributes:**

– `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– Includes the same set of child elements as the `textElementGroup` applicable for the actual data module type. Refer to Chap 3.9.5.2.1.10.

**Business rules decisions:**

– None identified

**Markup example:**

```
<termTitle>Attribute</termTitle>
```

2.3.1.2 Definition title

**Description:** The element <`definitionTitle`> contains the column title for the definition.

**Markup element:** <`definitionTitle`> (C)

**Attributes:**

– `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– Includes the same set of child elements as the `textElementGroup` applicable for the actual data module type. Refer to Chap 3.9.5.2.1.10.

**Business rules decisions:**

– None identified

**Markup example:**

```
<definitionTitle>Value</definitionTitle>
```

**2.3.2 Definition list item**

**Description:** The element <`definitionListItem`> contains the body of the definition list.

**Markup element:** <`definitionListItem`> (M)

ICN-S3627-S1000D0544-001-01

*Fig 4 Element <`definitionListItem`>*

**Attributes:**

– Includes the same set of attributes as the element <`seqentialList`>. Refer to Para 2.1.

**Child elements:**

– <`listItemTerm`> (M). Refer to Para 2.3.2.1.
– <`listItemDefinition`> (M). Refer to Para 2.3.2.2.

**Business rules decisions:**

– None identified

**Markup example:**

```
<definitionListItem>
<listItemTerm>
...
</listItemTerm>
<listItemDefinition>
...
</listItemDefinition>
</definitionListItem>
```

2.3.2.1 List item term

**Description:** This element is used to contain the term to be defined.

**Markup element:** <`listItemTerm`> (M)

**Attributes:**

– Includes the same set of attributes as the element <`seqentialList`>. Refer to Para 2.1.

**Child elements:**

– Includes the same set of child elements as the `textElementGroup` applicable for the actual data module type. Refer to Chap 3.9.5.2.1.10.

**Business rules decisions:**

– None identified

**Markup example:**

```
<listItemTerm>emph</listItemTerm>
```

2.3.2.2 List item definition

**Description:** The element <`listItemDefinition`> contains the term to be defined. It can contain text, or one or more paragraphs.

**Markup element:** <`listItemDefinition`> (M)

**Attributes:**

– `applicRefId` (O), the applicability information. Refer to Chap 3.9.5.3.
– `id` (O), the identifier of the <`listItemDefinition`> element. Refer to Chap 3.9.5.2.1.2.
– `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1
– `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– <`para`> (O). Refer to Chap 3.9.5.2.1.10.

If the element contains text, the child elements are:

- the same set of child elements as the `textElementGroup` applicable for the actual data module type (refer to Chap 3.9.5.2.1.10) and
- <`sequentialList`> (O). Refer to Para 2.1.
- <`randomList`> (O). Refer to Para. 2.2.
- <`definitionList`> (O). Refer to Para. 2.3.

**Business rules decisions:**

- None identified

**Markup example:**

```
<listItemDefinition>em01</listItemDefinition>
```

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use of the element <`title`>.** For all three list types, the project or the organization must decide whether to use list titles or not. Refer to Para 2.1 and Para 2.2.

**Simple or unordered lists.** For random lists, the project or the organization must define simple and unordered lists and their usage. Refer to Para 2.2.

**Use of the element <`definitionListHeader`>.** For the definition list, the project or the organization must decide whether to use the definition list header or not. Refer to Para 2.3.1.

# 4 Examples

## 4.1 Sequential list

The following example shows a sequential list.

```
<para>This is an example of a sequential list with two
items:<sequentialList>
<listItem>This is the first list item.</listItem>
<listItem>This is the second list item.</listItem>
</sequentialList>
</para>
```

## 4.2 Random list

### 4.2.1 Unordered

The following example shows an unordered random list.

```
<para>This is an example of an unordered random list with two
items:<randomList listItemPrefix="pf02">
<listItem>This is the first list item.</listItem>
<listItem>This is the second list item.</listItem>
</randomList>
</para>
```

### 4.2.2 Simple

The following shows a simple random list.

```
<randomList listItemPrefix="pf01">
<listItem>This is the first item.</listItem>
<listItem>
<para>This is the second item with two paras.</para>
<para>This is the second para of the second item.</para>
</listItem>
</randomList>
```

## 4.3 Definition list

The following is an example of a definition list.

```
<definitionList>
<definitionListItem>
<listItemTerm>Frame</listItemTerm>
<listItemDefinition>The frame is the skeleton of the
bicycle.</listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm>Wheel</listItemTerm>
<listItemDefinition>The wheel is the point of contact between
the bicycle and the road for the bicycle to have movement.
</listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm>Spokes</listItemTerm>
<listItemDefinition>The spokes are thick wires with tension
applied that connect the hub to the rim. You can adjust the
tension with the nipple on the rim side.</listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm>Hub</listItemTerm>
<listItemDefinition>The hub attaches to the center of the wheel
where the axle and the bearings are.</listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm>Metal rim</listItemTerm>
<listItemDefinition>The metal rim is a metal ring that has a U-
shaped cross section to hold the spokes on the inner side and
the tire on the outer side.</listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm>Seat</listItemTerm>
<listItemDefinition>The Seat, which is also known as the
'saddle', is used as the support platform for the person to sit
on the bicycle.</listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm>Seat post</listItemTerm>
<listItemDefinition>The Seat post is used as a support post for
the seat and to change the eight of the seat for the rider.
</listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm>...</listItemTerm>
<listItemDefinition>...</listItemDefinition>
</definitionListItem>
</definitionList>
```

# 1 General

This chapter contains the definition and handling of caption groups and captions from an author's point of view. It gives details about the available elements and attributes for:

- Caption groups
- Captions

# 2 Caption groups and captions

## 2.1 Caption groups

### 2.1.1 Definition

The element <captionGroup> can be used to represent blocks of illuminated warning lights, push buttons, annunciators, or display captions. The tabular <captionGroup> structure has been designed to provide limited control of formatting. By correctly applying the relevant attributes it is possible to create caption groups that are visually similar to the real object. Refer to Fig 1. The captions are normally rendered with a colored background that matches the color of the illuminated text.

ICN-AE-A-030905-0-U8025-00083-A-01-1

*Fig 1 Caption group comparison*

The <`captionGroup`> structure is based on the Continuous Acquisition and Life-cycle Support (CALS) table model with similar element names and attributes. Refer to Chap 3.9.5.2.1.6.

### 2.1.2 Caption group

**Description:** The element <captionGroup> is equivalent to a CALS table element <table>. It is used to represent blocks of illuminated warning lights, push buttons, annunciators, or display captions.

**Markup element:** <captionGroup> (O)

**Attributes:**

- alignCaption (O), sets the horizontal alignment of the text content of each <captionEntry> unless overridden by the align attribute the ancestor elements <colspec>, <spanspec>, <caption> or <captionText>. This attribute can have one of the following values:
  - "left", this means that the text is left justified (quad flush left),
  - "right", this means that the text is right justified (quad flush right),
  - "center", this means that the text is center justified (text is centered around the middle of the column).
- cols (M), The number of columns in the <captionGroup> table. This attribute can have a numeric value, greater than "0"
- colsep (O), A non-zero value for this attribute will draw a rule to the right of each <captionEntry> to which it applies. If the <captionEntry> is in the first column a rule will also be drawn on the left side. If the attribute is zero, then no column ruling will appear on either side of the <captionEntry> to which it applies. If the colsep attribute is not used, this implies that a column rule will not be drawn for the applicable columns. To set the column rulings for the complete column, set the colsep attribute on the colspec element that represents the column. Any values that are given in the <captionEntry> within a column will override the values given in a colspec element or a <captionGroup> element.
- rowsep (O), A non-zero value for this attribute will draw a rule below each <captionEntry> to which it applies. If the <captionEntry> is in the first <captionRow> a rule will also be drawn above. If the attribute is zero, then no row ruling will appear below the entries to which it applies. If the rowsep attribute is not used, this implies that a row rule will not be drawn for the applicable rows. To set the row rulings for the complete row, set the rowsep attribute on the row element that represents the row. Any values that are given in the entries of the row will override the values given in the <captionRow> or a <captionGroup> element.
- tableOfContentType (O), is used when generating Caption color based Tables of Contents, or color Table of Contents (TOC)s. This attribute can have one of the following values:
  - "none"(D)
  - "redtoc",
  - "comdtoc",
  - "ambertoc",
  - "greentoc",
  - "yelowtoc".
- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the <captionGroup> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

– `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– <`colspec`> (O). Refer to Chap 3.9.5.2.1.6.
– <`spanspec`> (O). Refer to Chap 3.9.5.2.1.6.
– <`captionBody`> (M). Refer to Para 2.1.3.

**Business rules decisions:**

– None identified

**Markup example:**

– Refer to Para 4.

### 2.1.3 Caption body

**Description:** The element <`captionBody`> is equivalent to a CALS table element <`tbody`>. Refer to Chap 3.9.5.2.1.6.

**Markup element:** <`captionBody`> (O)

**Attributes:**

– `valign` (O), Sets the vertical alignment of the contents of each <`captionEntry`>, unless overridden by the attribute `valign` on element <`captionEntry`>. The `valign` attribute's value defines the vertical position of a caption within its <`captionEntry`>, it does not affect the alignment of the text within a caption. This attribute can have one of the following values:
  - "`top`" (D),
  - "`bottom`" ,
  - "`middle`".
– `applicRefId` (O), the applicability information. Refer to Chap 3.9.5.3.

**Child elements:**

– <`captionRow`> (M), Refer to Para 2.1.4.

**Business rules decisions:**

– None identified

**Markup example:**

– Refer to Para 4.

### 2.1.4 Caption row

**Description:** The element <`captionRow`> represents a caption table row and is equivalent to a CALS table element <`row`>. Refer to Chap 3.9.5.2.1.6.

**Markup element:** <`captionRow`> (O)

**Attributes:**

– `rowsep` (O), Refer to Para 2.1.2. A non-zero value for this attribute will draw a rule. If the `rowsep` attribute is not used, it implies that a column rule will be drawn.
– `applicRefId` (O), the applicability information. Refer to Chap 3.9.5.3.

- id (O), the identifier of the <captionRow> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <captionEntry> (M), Refer to Para 2.1.5.

**Business rules decisions:**

- None identified

**Markup example:**

- Refer to Para 4.

### 2.1.5 Caption entry

**Description:** The element <captionEntry> represents the table cells that contain the captions or caption text; it is equivalent to a CALS table element <entry>. Refer to Chap 3.9.5.2.1.6.

**Markup element:** <captionEntry> (O)

**Attributes:**

- colname (O), this attribute is used to relate the element <captionEntry> to its column definition in the element <colspec>. The width of each <captionEntry> can only be defined in the <colspec>. If this attribute is missing, the column width should be wide enough to contain any child caption element. The value is the name of a column defined in a <colspec> element in the current <captionGroup>
- namest (O), this attribute locally defines the start column of a horizontal span of merged <captionEntry> elements. The value must be the name of a column defined in a <colspec> element in the current <captionGroup>.
- nameend (O), locally defines the end column of a horizontal span of merged <captionEntry> elements. The value must be the name of a column defined in a <colspec> element in the current <captionGroup>
- spanname (O), this attribute is a named, reusable span specification for merged <captionEntry> elements. The value must be the name of a span defined in a <spanspec> element in the current <captionGroup>
- morerows (O), this attribute locally defines the number of additional rows in a vertical span of merged <captionEntry> elements. The value must be the number of spanned rows minus 1.
- captionAlign (O), this attribute sets the horizontal alignment of each <caption>. The attribute's value defines the horizontal position of a caption within its <captionEntry>, it does not affect the alignment of the text within a caption. This attribute can have one of the following values:
  - "left" (D),
  - "right",
  - "center". The default value is "left".
- valign (O), this attribute sets the vertical alignment of the contents of each <captionEntry> in the row, unless overridden by the attribute valign on an

element <captionEntry>. The valign attribute's value defines the vertical position of a caption within its <captionEntry>, it does not affect the alignment of the text within a caption. This attribute can have one of the following values:
- "top" (D)
- "bottom"
- "middle"

– colsep (O). Refer to Para 2.1.2. This attribute is used to display rules to the right of the column to which it applies. A colsep that is set on a <captionEntry> will determine if a rule is drawn for the height of the entry only. A non-zero value for this attribute will draw a rule. If the colsep attribute is not used, it implies that a row rule will not be drawn.
– rowsep (O). Refer to Para 2.1.2. This attribute is used to display rules below the row to which it applies. A rowsep that is set on a <captionEntry> element determines if a rule is drawn for the width of the entry only. A non-zero value for this attribute will draw a rule. If the rowsep attribute is not used, it implies that a column rule will not be drawn.
– applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.

**Child elements:**

– <caption> (O), (See Para 2.2.1) or
– <captionText> (O), (Refer to Para 2.1.6).

**Business rules decisions:**

– None identified

**Markup example:**

– Refer to Para 4.

### 2.1.6 Caption text

**Description:** The element <captionText> allows text to be added to a <captionGroup>.

**Markup element:** <captionText> (O)

**Attributes:**

– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

**Child elements:**

The element can contain text mixed with the following elements:

– <internalRef> (O). Refer to Chap 3.9.5.2.1.2.
– <indexFlag> (O). Refer to Chap 3.9.5.2.1.10.
– <changeInline> (O). Refer to Chap 3.9.5.2.1.1.
– <emphasis> (O). Refer to Chap 3.9.5.2.1.10.
– <subScript> (O). Refer to Chap 3.9.5.2.1.10.
– <superScript> (O). Refer to Chap 3.9.5.2.1.10.
– <dmRef> (O). Refer to Chap 3.9.5.2.1.1.
– <pmRef> (O). Refer to Chap 3.9.5.2.1.1.
– <externalPubRef> (O). Refer to Chap 3.9.5.2.1.1.
– <acronym> (O). Refer to Chap 3.9.5.2.1.10.
– <acronymTerm> (O). refer to Chap 3.9.5.2.1.10

**Business rules decisions:**

– None identified

**Markup example:**

– Refer to Para 4.

### 2.1.7 Formatting options

The effect of the formatting attributes is shown in Fig 2, with the markup for each element <`captionEntry`> given in

ICN-AE-A-030905-0-U8025-00084-A-02-1

*Fig 2 <`captionGroup`> formatting options*

The four element <`captionEntry`> table cells in Fig 2 are formatted as shown in Table 2 . The light blue cell borders simply show the outline of each element <`captionEntry`>, but would not be visible in the output.

*Table 2 <`captionGroup`> formatting options*

| <captionEntry> | Formatting attribute settings |
|---|---|
| 1 | `<captionEntry colname="col1">`<br>`<caption captionWidth="30mm" captionHeight="10mm" color="co04">`<br>`<captionLine>CAPTION LINE</captionLine>`<br>`</caption>`<br>`</captionEntry>` |
| 2 | `<captionEntry colname="col1">`<br>`<caption captionWidth="30mm" captionHeight="30mm" color="co03">`<br>`<captionLine>CAPTION LINE</captionLine>`<br>`<captionLine>CAPTION LINE</captionLine>`<br>`</caption>`<br>`</captionEntry>` |
| 3 | `<captionEntry colname="col2" align="right">`<br>`<caption captionWidth="25mm" captionHeight="10mm" color="co04"`<br>` align="right">`<br>`<captionLine>CAPTION LINE</captionLine>`<br>`</caption>`<br>`</captionEntry>` |

| <captionEntry> | Formatting attribute settings |
|---|---|
| 4 | `<captionEntry colname="col2" valign="middle" colsep="1" rowsep="1">`<br>`<caption captionWidth="30mm" captionHeight="10mm" color="co01" align="left">`<br>`<captionLine>CAPTION LINE</captionLine>`<br>`</caption>`<br>`</captionEntry>` |

## 2.2 Captions

### 2.2.1 Caption

**Description:** This element <caption> represents a single illuminated warning light, push button, annunciator, or display caption. It can be used inline within text content elements such as <para>, or grouped within the element <captionGroup> structure as given in Para 2.

Each caption can contain lines of text in individual <captionLine> elements.

**Markup element:** <caption> (O)

**Attributes:**

- color (O). The color of the caption object. The definitions for the colors are stored in the project or default BREX data module. This element can have the following values:
  - "co00" thru "co99". The default value is "co09". Refer to Chap 3.9.6.
- captionWidth (O), the width of the caption object. The value must be a positive number, plus a unit of measure.
- captionHeight (O), the height of the caption object. The value must be a positive number, plus a unit of measure.
- systemIdentCode (O), the system identification code as defined by the project
- align (O), See Para 2.1.2.
- tableOfContentType (O), is used when generating Caption color based Tables of Contents, or color TOCs. This attribute can have one of the following values:
  - "none"(D)
  - "redtoc"
  - "comdtoc"
  - "ambertoc"
  - "greentoc"
  - "yelowtoc".
- captionType (O), as defined by the project. This elements can have the one of the following values:
  - "primary" (D)
  - "secondary".
- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the <caption> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– <captionLine> (M), Refer to Para 2.2.2.

**Business rules decisions:**

– None identified

**Markup example:**

– Refer to Para 4.

### 2.2.2 Caption line

**Description:** This element represents a single line of text, so its text content should not wrap to second or subsequent lines.

**Markup element:** <captionLine> (M)

**Attributes:**

– None

**Child elements**: The element can contain text mixed with the element

– <acronymTerm> (O), Refer to Chap 3.9.5.2.1.10.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– use of presentation settings

**Markup example:**

```
<para>This is an example caption <caption color="co04"
captionWidth="25mm"><captionLine>SPEED</captionLine>
</caption> embedded in a paragraph.</para>
```

## 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use of applicability information.** The project or the organization must decide if the indication of applicability information is permitted on various captionGroup subelements depending on the Product configuration. If permitted, then the project or the organization must also decide on the use of the attribute applicRefId for this purpose. Refer to Para 2.1.2.

**Use of presentation settings.** The project or the organization must decide:

– Whether the attribute rowsep and the attribute colsep rules between <captionEntry> elements are required or not.
– Whether element <captionEntry> spans are to be defined locally or by element <spanspec>.
– Whether the attribute tableOfContentType is required or not.
– The definition of any of the attribute color in the range "co51" to "co99".
– How to encode the attribute systemIdentCode if used.
– Whether the attribute tableOfContentType is required or not.
– If inline captions affect the text line spacing and how this is defined.
– If element <captionLine> text color should be adjusted depending on the caption color to provide adequate contrast. Refer to Para 2.2.2.

# 4 Examples

```
<captionGroup cols="2" applicRefId="appl-001"
changeMark="1" changeType="add" reasonForUpdateRefIds="rfu-01">
<colspec colnum="1" colname="col1" colwidth="30mm"/>
<colspec colnum="2" colname="col2" colwidth="30mm"/>
<captionBody>
<captionRow>
<captionEntry colname="col1">
<caption color="co04" captionWidth "30mm">
<captionLine>ALTITUDE</captionLine>
</caption>
</captionEntry>
<captionEntry colname="col2">
<caption color="co51" captionWidth="30mm">
<captionLine>0 miles</captionLine>
</caption>
</captionEntry>
</captionRow>
<captionRow>
<captionEntry colname="col1">
<caption color="co04" captionWidth="30mm">
<captionLine>SPEED</captionLine>
</caption>
</captionEntry>
<captionEntry colname="col2">
<caption color="co51" captionWidth="30mm">
<captionLine>0 mph</captionLine>
</caption>
</captionEntry>
</captionRow>
<captionRow>
<captionEntry colname="col1">
<caption color="co04" captionWidth="30mm">
<captionLine>DISTANCE</captionLine>
</caption>
</captionEntry>
<captionEntry colname="col2">
<caption color="co51" captionWidth="30mm">
<captionLine>0 miles</captionLine>
</caption>
</captionEntry>
</captionRow>
</captionBody>
</captionGroup>
```

## *References*

*Table 1 References*

| Chap No./Document No. | Title |
|---|---|
| Chap 3.6 | Information generation - Security and data restrictions |
| Chap 3.9.1 | Authoring - General writing rules |
| Chap 3.9.5.2.1.10 | Common constructs - Text elements |

## 1 General

This chapter contains the definition and use of titles from an author's point of view.

## 2 Titles

**Description:** The element <title> contains the title for a paragraph, step, table or figure, etc.

In descriptive data modules, titles can be included for the element <levelledPara> from sublevel one thru five, but must be included for element <figure> and element <table> for formal tables. Refer to Chap 6.2.2.

In procedural, process, crew and fault data modules, titles must be included for <figure> and <table> for formal tables. Titles can also be included for the element <proceduralStep> from sublevel one thru five. Refer to Chap 6.2.2.

All titles must be presented in sentence case. Refer to Chap 3.9.1.

**Markup element:** <title> (O)

**Attributes:**

– `securityClassification` (O), `commercialClassification` (O) and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6

**Child elements:**

– Includes the same set of child elements as the `textElementGroup` applicable for the actual data module type. Refer to Chap 3.9.5.2.1.10.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– use of the element <`title`>
– cross-references in titles
– use of titles for non-S1000D data

**Markup example:**

```
<title>This is a title</title>
```

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use of the element <`title`>**. The project or the organization must provide rules for the use of titles within the elements where they are optional in the schema. These should include rules for when an optional title is mandatory for a project, and the contexts in which these rules apply. For example, a project can decide that titles are always required on level one and level two paragraphs in a descriptive data module because they appear in the table of contents, or that they must be used in certain circumstances for procedural data modules. Refer to Para 2.

**Cross-references in titles**. In situations where the title can be extracted from the data module and used, for example, within a table of contents data module, or a list of illustrations, the project should enforce the rule that cross-references to locations within the same data module are not used in the title text because the item being referred to can not be in the auto-generated data module. Refer to Para 2.

**Use of titles for non-S1000D data.** The project or the organization must decide on the use of titles for non-S1000D data. Titles can be included for the elements <`levelledPara`> and <`proceduralStep`> from sublevel six thru eight. However, the use of titles on these subparagraphs and step levels is discouraged and their use and presentation are project decisions. Refer to Para 2.

# 4 Examples

```
<description>
<levelledPara>
<title>Brake system</title>
<para>The most important part of the bicycle is the brake
system. Only a minimum maintenance of the brake system is
necessary. But, when a problem does occur, make sure you
do the necessary maintenance as quickly as possible.
If you do not do this the bicycle will be dangerous to
use.</para>
<para>There are nine different types of brake systems. The
one found on most bicycles is the cantilever brake (refer to
<internalRef internalRefId="par-0001"
```

```
internalRefTargetType="para"></internalRef>).</para>
<levelledPara id="par-0001">
<title>Cantilever brake</title>
<para>The brake system (refer to
<internalRef internalRefId="fig-0001"
internalRefTargetType="figure"></internalRef>) has
these primary components:
<randomList listItemPrefix="pf01" changeMark="1">
<listItem>
<para>the brake lever (refer to

# 1 General

This chapter contains the definition and handling of tables from an author's point of view. It gives details about the available elements and attributes and how to use them to create tables in a data module. It also serves as a guide to stylesheet designers who will have to create the templates for presenting the tables in a page-oriented output or an IETP where a table must be presented by using the formatting information contained in the table's presentation attributes that have been set by the author.

The rules for the presentation of tables in page-oriented publications and IETP are given in Chap 6.2.2 and Chap 6.3.1, respectively.

Parts of this chapter have been derived from the Oasis information about the Continuous Acquisition and Life-cycle Support (CALS) table model which can be found at http://www.oasis-open.org/specs/a502.htm.

# 2 Tables

## 2.1 Definition

There are two types of tables:

- Formal
- Informal

A formal table consists of four parts, the table title, the table head, the optional table footer and the table body. Each of these parts contains the rows and entries that comprise the table.

An informal table is a short, simple table, which does not need a table title, table head and table footer. These tables are typically small and contain only a few columns and rows.

Table titles must be written in sentence case and have no period [.] at the end.

When formatted, table titles must not exceed two lines.

A formal table can be column-width or image-width. A column width table is one which starts at the left type limit (ie taking into account any indents) and covers the remaining space available to the right type limit. An image width table starts at the left margin and covers the space up to the right margin. To define a column-width or image-width table, use the attribute `pgwide` as defined in Para 2.5.

**Note**

For page-oriented publications, if it is not possible to fit a table into the full image width (170 mm), the table must be presented on a fold-out page (ie by wrapping the <`table`> in the element <`foldout`> (refer to Chap 3.9.5.2.1.7)).

## 2.2 Specific Tables

Chap 6.2.2 details the required presentation for seven specific tables and each of these has its own mark up element. The rest of this chapter discusses tables that are marked up using the <`table`> element. The seven specific tables are:

1 References (O). Used in all data modules (element <`refs`>). Refer to Chap 3.9.5.2.1.2

2 Required conditions (C). Used in procedural, schedule, and fault isolation procedure data modules (element <`reqCondGroup`>). Refer to Chap 3.9.5.2.1.9.

3 Required persons (O). Used in procedural, schedule and fault isolation procedure data modules (element <`reqPersons`>). Refer to Chap 3.9.5.2.1.9.

4 Support equipment (C). Used in procedural, schedule and fault isolation data modules (element <`reqSupportEquips`>). Refer to Chap Chap 3.9.5.2.1.9.

5 Consumables, materials and expendables (C). Used in procedural, schedule and fault isolation data modules (element <`reqSupplies`>). Refer to Chap Chap 3.9.5.2.1.9.

6 Spares (C). Used in procedural, schedule and fault isolation data modules (element: <`reqSpares`>). Refer to Chap Chap 3.9.5.2.1.9.

7 Caption group (O). Used in all data modules. Refer to Chap 3.9.5.2.1.4.

## 2.3 Tables as graphics

Tables normally are marked up using the elements and attributes which define the table heading, the footer and the body which contain rows and entries. It is also possible to present a table using the graphic element (although this is discouraged).

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– use of tables as graphics

## 2.4 Attribute inheritance

In order to understand the CALS table model, the concept of attribute inheritance needs to be explained. This applies to the table presentation attributes such as `rowsep` and `colsep` (which determine if table rulings are required) and alignments etc. Attributes on higher level elements set formatting defaults that can be overridden by the same attributes set on lower level elements. For example, a default row separation can be specified for the complete table on the <`table`> element, and this applies to the complete table, unless values are expressed on contained table groups, column specifications, rows, entries etc. A presentation attribute value expressed at a level applies to that level and to its children (unless any child element's attributes override it). As an example, a `rowsep` value of "`1`" applies to all entries in the row, except any <`entry`> with a `rowsep` value specified.

## 2.5 Table markup

**Description:** The element <table> is used to contain information which is to be presented in a tabular form. The element is used for both formal and informal tables.

**Markup element:** <table> (O)

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the table element. Refer to Chap 3.9.5.2.1.2. It must only be used for tables that have a title (and hence have an enumerated table number).
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- tabstyle (O), defines a style for the table. Although the CALS table model allows the value of this attribute to determine the presentation style of the table (in terms of the table rulings, the frame, the orientation etc), S1000D mandates that the presentation attributes are populated with the correct values to make the table display correctly in any application. This attribute must not be used for tables that only contain a graphic (refer to Para 2.2).
- tocentry (O), determines whether the table will appear in the list of tables. If the value of this attribute is "0," the table's title will not appear in the automatically generated list of tables at the front of the data module. If the value is not "0," or the attribute is not used, and the table has a title, it will appear in the list of tables. If the table has a title and you do not wish it to appear in the list of tables, you must specify a tocentry value of "0."
- frame (O), defines the style of the outside rulings of the table. It can have the values that follow:
  - "all" (D), draws a rule above and below the table, and to the left and right.
  - "sides", draws a rule on the left and right of the table, but not on the top and bottom
  - "top", draws a rule above the table, but not below, or to the left or right of the table
  - "topbot", draws a rule above and below the table (this is the setting to be used for S1000D formal tables)
  - "bottom", draws a rule below the table
  - "none", indicates no rules will be drawn for the frame of the table

  **Note**

  If the attribute frame is not used, then this implies that all frame rulings will be drawn (ie equivalent to the value "all"). It is important to set frame="topbot" for S1000D formal tables. This attribute must not be used for tables that only contain a graphic (refer to Para 2.2).

- colsep (O),defines the column separator setting. A non-zero value for this attribute will draw a rule to the right of the table entries to which it applies. If the attribute is zero, then no column ruling will appear to the right of the entries to which it applies. The value of colsep is ignored for the rightmost column because the rulings for this column are given by the setting of the frame attribute. If the attribute colsep is not used, this implies that a column rule will be drawn for the applicable columns. To set the column rulings for the complete column, set the attribute colsep on the element <colspec> that represents the column. Any values that are given in the entries of the column will override the values given in a <colspec> element. This attribute must not be used for tables that only contain a graphic (refer to Para 2.2).
- rowsep (O), defines the row separator setting. A non-zero value for this attribute will draw a rule below the table entries to which it applies. If the attribute is zero, then no row ruling will appear below the entries to which it applies. The value of rowsep is ignored for the last row because the rulings for this row are given by the setting of the frame attribute. If the

rowsep attribute is not used, this implies that a row rule will be drawn for the applicable rows. To set the row rulings for the complete row, set the attribute rowsep on the row element that represents the row. Any values that are given in the entries of the row will override the values given in the row element. This attribute must not be used for tables that only contain a graphic (refer to Para 2.2).

- orient (O), defines the orientation of the table. The default setting (when the attribute is not used) is portrait. The attribute can contain the values "port" (representing a portrait orientation) or "land" (representing a landscape orientation). A landscape orientation is one that is 90 degrees counter-clockwise to the normal writing direction. This attribute must not be used for tables that only contain a graphic (refer to Para 2.2).
- pgwide (O), defines the width of the table relative to the page. A value other than zero for this attribute defines that the table is to span the width of the page (or the display area) and will ignore any indentation settings that can be in place where the table element appears A value of 0 (or if the attribute is not used) means that the table will span the page but be within the current indentation settings. The correct setting of this attribute for S1000D tables that are image-wide is a non-zero value. For column-wide tables, this attribute must not be used or set. This attribute must not be used for tables that only contain a graphic (refer to Para 2.2). The value of attribute pgwide is ignored if the orientation of the table is landscape (because landscape tables have an implied to be image-width.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <title> (O). This element is mandatory for formal tables and optional for informal tables. Refer to Chap 3.9.5.2.1.5.
- <tgroup> (O). Refer to Para 2.5.1.
- <graphic> (O). Refer to Chap 3.9.5.2.1.7.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of tables marked up as graphics are allowed
- use of applicability information

**Markup example:**

The markup example that follows, shows a table that contains a graphic (refer to Para 2.2).

```
<table id="T0002">
<title>Widget - inspection limits</title>
<graphic infoEntityIdent="ICN-E2-A-723200-R-K0378-01234-A-01-1">
...
</graphic>
</table>
```

### 2.5.1 Table group

**Description:** A table can contain one or more table group <tgroup> elements. Normally, there will be one table group. Multiple table groups are used to define portions of the table that have different presentation requirements (eg column and row specifications).

**Markup element:** <tgroup> (O)

**Attributes:**

- `applicRefId` (O), the applicability information. Refer to Chap 3.9.5.3.
- `cols` (M), defines the number of columns in the table.
- `tgstyle` (O), the table group style. This defines that a specified style (eg column and row specifications) is to be applied to the table group. Although the CALS table model allows the value of this attribute to determine the presentation style of the table (in terms of the table rulings, the frame, the orientation etc), S1000D mandates that the presentation attributes are populated with the correct values to make the table display correctly in any application.
- `colsep` (O), the column separator default setting. Refer to Para 2.5 for the description of `colsep` on <`table`>. In the context of <`tgroup`>, this is the default setting for column rulings for the table group and takes precedence over defaults set using `colsep` on <`table`>. A non-zero value means that column rulings will appear to the right of all columns of the table group unless there are is a 0 value given in the child `entry` elements (which will override the settings for that entry only). A value of 0 means that there are to be no column rulings for the table group. If the attribute `colsep` is not specified for the table group, this implies that column rulings are required (unless `colsep` values on individual <`entry`> elements state otherwise).
- `rowsep` (O), the column separator default setting. Refer to Para 2.5. for the description of `rowsep` on <`table`>. In the context of <`tgroup`>, this is the default setting for row rulings for the table group and takes precedence over defaults set using `rowsep` on <`table`>. A non-zero value means that row rulings will be appear beneath each row of the table group unless there are values given in the child <`entry`>. A value of 0 means that there will be no row rulings. If the attribute `rowsep` is not specified for the table group, this implies that row rulings are required (unless `rowsep` values on individual <`row`> elements state otherwise).
- `align` (O), alignment. This attribute provides the default alignment setting for the table group (which is the horizontal position of the text within the column) and applies to all entries in the table group that do not have an alignment specified by their own `align` attribute, or in their parent table <`row`> element. The values for `align` are:
  - "`left`" means that the text is left justified (quad flush left)
  - "`right`" means that the text is right justified (quad flush right)
  - "`center`" means that the text is center justified (text is centered around the middle of the column)
  - "`justify`" means that the text is justified (both quad left and right)
  - "`char`" means that text is aligned to the leftmost occurrence of the value of the attribute `char` value. When the attribute `align` is set to "`char`", attributes `char` and `charoff` must be used. The attribute `char` is the single character that is used to align the text. The most common use is to align on a '.' (a full stop, or period) for decimal alignment of a column of numbers as shown in Fig 1:

```
1002.23
 675.34
   0.002
```

ICN-83007-0000000062-001-01

*Fig 1 Example of "`char`" alignment*

This causes the text to range left or right around the fixed location of the decimal point.

The attribute charoff is used to position the alignment character within the width of the cell. This is given as a percentage of the cell width and must only be used when the attribute align is set to "char."

- charoff (C), the value is used when the value of the align attribute is "char". It is a number that represents the percentage of the column width to the left of the alignment character specified in the attribute char and must only be used when the attribute align is set to "char".
- char (C), the value is used when the value of the align attribute is "char". The value is the single alignment character source for any implied char values and must only be used when the align attribute is set to "char".

**Child elements:**

- <colspec> (O). Refer to Para 2.5.5.
- <spanspec> (O). Refer to Para 2.5.6.
- <thead> (O), defines the header of the table in terms of its rows and entries (refer to Para 2.5.2). For page-oriented output, the header will be replicated on each page when the table spans multiple pages. S1000D formal tables must always have a table header.
- <tfoot> (O), contains the rows and entries (refer to Para 2.5.3) that define the footer of the table when one is needed.
- <tbody> (M), contains the rows and entries (refer to Para 2.5.4) that define the body of the table.

**Business rules decisions:**

- None identified

**Markup example:**

```
<tgroup cols="2">
<colspec colname="col1" colwidth="1*"/>
<colspec colname="col2" colwidth="1*"/>
<tbody>
<row>
<entry><para>row 1, column 1</para></entry>
<entry><para>row 1, column 2</para></entry>
</row>
<row>
<entry><para>row 2, column 1</para></entry>
<entry><para>row 2, column 2</para></entry>
</row>
</tbody>
</tgroup>
```

### 2.5.2 Table header

**Description:** The element <thead> (table header) contains the rows of the table that provide the column headings and is mandatory for S1000D formal tables. The table header is displayed in bold type face and, for page-oriented output, will be displayed at the top of each page on which the table appears. The table header must contain at least one table row. There is no need to use emphasis to make a table header bold.

**Markup element:** <thead> (O)

**Attributes:**

- valign (O), specifies how the text is to be presented in each <entry> that does not have its own valign attribute set. It has one of the values that follow, and the default

setting if the attribute is not used is top. The value of valign on the <thead> element supplies the default alignment for the entire table header. These values are overridden by values that are contained in the table header's entries (if they are present). This attribute can have one of the following values:

- "top" for the text to be presented at the top of the <entry>
- "middle" for the text to presented in the middle of the <entry>
- "bottom" for the text to be presented at the bottom of the <entry>

**Child elements:**

– <colspec> (O). Refer to Para 2.5.5.This specifies the presentation information of each column in the table header and, if present, overrides any column specifications found in the table group (refer to Para 2.5.1).
– <row> (M). Refer to Para 2.5.7. The table header must contain at least one row. For S1000D formal tables, the last row of the table header must have its rowsep attribute set to a non-zero value.

**Business rules decisions:**

– None identified

**Markup example:**

```
<thead>
<row rowsep="1">
<entry><para>Area</para></entry>
<entry><para>Maximum blend depth</para></entry>
<entry><para>Maximum blend length</para></entry>
<entry><para>Maximum blend width</para></entry>
<entry><para>Maximum number of blends</para></entry>
</row>
</thead>
```

### 2.5.3 Table footer

**Description:** The element <tfoot> (table footer) contains the rows and entries that represent the table footer. The table footer is to appear at the end of the table (ie after the last table body row). For page-oriented publications, the table footer is to appear after the last row of each page on which the table appears.

**Markup element:** <tfoot> (O)

**Attributes:**

– valign (O), specifies how the text is to be presented in each entry that does not have its own valign attribute set. It has one of the values that follow, and the default setting if the attribute is not used is top.
  - "top", the text is presented at the top of the entry
  - "middle", the text is presented in the middle of the entry
  - "bottom", the text is presented at the bottom of the entry.

**Child elements:**

– <colspec> (O). Refer to Para 2.5.5.This specifies the presentation information of each column in the table footer and, if present, overrides any column specifications found in the table group (refer to Para 2.5.1).
– <row> (M). Refer to Para 2.5.7. The table footer must contain at least one row.

**Business rules decisions:**

– None identified

**Markup example:**

```
<tfoot>
<row>
<entry spanname="all5"><para>Example footnote</para></entry>
</row>
</tfoot>
```

### 2.5.4 Table body

**Description:** The element <tbody> (table body) contains the rows of the table that provide the primary content and is mandatory for all tables. The table body must contain at least one table row.

**Markup element:** <tbody> (M)

**Attributes:**

– valign (O), specifies the default within the body of the table for how the text is to be presented in each entry that does not have its own valign attribute set. If the attribute is not used, the default setting is top. The value of valign on the <tbody> element supplies the default alignment for the entire table body. These values are overridden by values that are contained in the table header's entries (if they are present). This attribute can have one of the following values:
  - "top" for the text to be presented at the top of the entry
  - "middle" for the text to presented in the middle of the entry
  - "bottom" for the text to be presented at the bottom of the entry

**Child elements:**

– <row> (M). Refer to Para 2.5.7. The table header must contain at least one row. For S1000D formal tables, the last row of the table header must have its rowsep attribute set to a non-zero value.

**Business rules decisions:**

– None identified

**Markup example:**

```
<tbody>
<row>
<entry><para>row 1, column 1</para></entry>
<entry><para>row 1, column 2</para></entry>
</row>
<row>
<entry><para>row 2, column 1</para></entry>
<entry><para>row 2, column 2</para></entry>
</row>
</tbody>
```

### 2.5.5 Column specification

**Description:** The element <colspec> (column specification) is used in the table group (<tgroup>, refer to Para 2.5.1) and can be overridden by <colspec> elements in the table header (<thead>, refer to Para 2.5.2), table footer (<tfoot>, refer to Para 2.5.3) and the table body (<tbody>, refer to Para 2.5.4). When used in the table header, table footer and

table body, the values specified override those that can be present on the table group and these values are in turn overridden by the settings of the same attributes on individual rows and entries

**Markup element:** <colspec> (O)

**Attributes:**

- colnum (O), represents the number of the column starting at 1 which represents the leftmost row. The column number is not used in any span specification (refer to Para 2.5.6) and simply serves as a consistency check for the authoring and / or software.
- colname (O), is the name of the column that is used to specify the position or horizontal span of columns in a row. It can also be used in the <entry> element (refer to Para 2.5.8) using the colname, or the namest with nameend attributes. It can also used by the <spanspec> element in its namest and nameend attributes (refer to Para 2.5.6).
- align (O), is the default alignment for entries in the table body. Refer to Para 2.5.1
- charoff (O), is the default character offset for alignment of entries in the table body. Refer to Para 2.5.1:
- char (O), is the character on which to align. Refer to Para 2.5.1.
- colwidth (O), is the column width setting. Column width can be specified using either ar proportional measure, a fixed measure, or a mixed measure.
  - A proportional measure is of the form "number*" (eg 10*), and means that the column width is the number times the proportion.
  - A fixed measure is of the form number and unit (eg 25pt, 25mm, 16.2in). The units are case insensitive and can be "pt" (points), "cm" (centimeters), "mm" (millimeters), "pi" (picas), and "in" (inches). The default fixed unit should be interpreted as "pt" if neither a proportion nor a fixed unit is specified. An example of a mixed measure is 10*+3pt.
  - If no column width is specified for a column specification, this implies that the column has the proportional width "1*", and hence, if no column widths are specified for any column, the column widths will be the same for each column and will be an equal proportion of the available width.
- colsep (O), is the column separator setting. Refer to Para 2.5.
- rowsep (O), is the row separator setting. Refer to Para 2.5.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

```
<colspec colname="col1" colwidth="1*"/>
<colspec colname="col2" colwidth="1*"/>
<colspec colname="col3" colwidth="1*"/>
<colspec colname="col4" colwidth="1*"/>
<colspec colname="col5"/>
```

### 2.5.6 Span specification

**Description:** The element <spanspec> (span specification) identifies a horizontal span of columns and associated attributes that can subsequently be referenced by its spanname for repeated use in a table's <entry> elements. A <spanspec> uses column names from <colspec>s defined in that context. It gets default values from the <colspec> that provides the namest. namest and nameend identify the first and last columns in

increasing left-to-right order that identify the span. The reason colname is used rather than colnum in identifying <spanspec> is that the names are independent of revisions that can change the number of inserted/deleted columns, as long as namest remains to the left of (has a smaller colnum than) nameend. In a <thead> or <tfoot>, if any <colspec>s are redefined, the <tgroup> <spanspec>s are ignored in references to spanname from <entry>s within this <thead> or <tfoot>. When such redefinition occurs, any spanning should be by namest and nameend.

**Markup element:** <spanspec> (M)

**Attributes:**

- namest (M), contains the name of leftmost column of span (as defined in the column's colname attribute of its <colspec> element).
- nameend (M), contains the name of rightmost column of span (as defined in the column's colname attribute of its <colspec> element).
- spanname (M), uniquely identifies the span, and is the name that is applied in an <entry> element's spanname attribute (refer to Para 2.5.8).
- align (O), the alignment. Refer to Para 2.5.1.
- charoff (O), the character offset. Refer to Para 2.5.1.
- char (O), the character on which to align. Refer to Para 2.5.1.
- colsep (O), determines if the columns covered by the span are to have column rulings (this value is overridden by the colsep attribute on the <entry> elements if they are present (refer to Para 2.5.5)
- rowsep (O), determines if the rows covered by the span are to have row rulings (this value is overridden by the attribute rowsep on the <entry> and on the <row> elements if they are present (refer to Para 2.5.7).

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

```
<spanspec namest="col1" nameend="col2" spanname="col1-2"/>
<spanspec namest="col1" nameend="col5" spanname="all5"/>
```

### 2.5.7 Table row

**Description:** The element <row> (table row) represents a row in a table header (refer to Para 2.5.2), a table footer (refer to Para 2.5.3), or a table body (refer to Para 2.5.4). The table row contains at least one <entry> (refer to Para 2.5.8). The values specified for the attributes rowsep and valign override any values for these attributes given in a parent element. These values are also overridden by any settings applied to <entry> elements.

**Markup element:** <row> (M)

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the row element. Refer to Chap 3.9.5.2.1.2.

- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- rowsep (O), the default row separator setting for the row. Refer to Para 2.5.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <entry> (M). Refer to Para 2.5.8.

**Business rules decisions:**

- None identified

**Markup example:**

```
<row>
<entry><para>row 1, column 1</para></entry>
<entry><para>row 1, column 2</para></entry>
</row>
```

### 2.5.8 Table entry

**Description:** The element <entry> (table entry) represents a table cell.

**Markup element:** <entry> (M)

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the entry element. Refer to Chap 3.9.5.2.1.2.
- warningRefs (O), the warning reference to the warnings and cautions collection. Refer to Chap 3.9.3.
- cautionRefs (O), the caution reference to the warnings and cautions collection. Refer to Chap 3.9.3.
- colname (O), is used to specify the column name for the <entry>. If this attribute is used, and there is also a spanname or nameset value used, then the attribute is ignored. It is an error if a column name is specified that does not have a corresponding definition in a <colspec> element.
- namest (O), is used to define the start column of the entry for entries that are spanned across multiple columns (the nameend attribute defines the column in which the entry ends). The value entered in namest must have a corresponding column definition (<colspec>). If namest is specified with no nameend, then the entry will span a single column. Standard spans can also be defined by using the <spanspec> element and referencing it using the spanname attribute. Refer to Para 2.5.6.
- nameend (O), is used to define the end column for spanned entries.
- spanname (O), is used to apply a standard span to the entry that is defined in the corresponding <spanspec> element. Refer to Para 2.5.6.
- morerows (O), defines the vertical straddling of the entry (ie the number of rows that the entry spans). For example, a morerows value of 1 means that the entry will straddle the current and the next row. There must be at least as many rows in the <tbody>, <thead> or <tfoot> to cover the number of rows straddled by the entry. If there is a rowsep attribute specified, it applies to the first row that is straddled by the entry.

- colsep (O), is the column separator setting for the entry. Refer to Para 2.5.
- rowsep (O), is the row separator setting for the entry. Refer to Para 2.5.
- rotate (O), can be zero or non-zero and is used to specify that the contents of the entry are to be rotated. If the value is0, or the attribute is not used, then the text in the entry is presented in the orientation of the table (as set by the orient attribute – refer to Para 2.5). If the orientation is landscape, and the value of the rotate attribute is 1, the resulting text is displayed upside-down to the page's headers and footers.
- valign (O), the vertical alignment of the entry. Refer to Para 2.5.8.
- align (O), the horizontal alignment of the entry. Refer to Para 2.5.1.
- charoff (O), the character offset. Refer to Para 2.5.1.
- char (O), the character on which to align. Refer to Para 2.5.1.

**Child elements:**

- <para> (O) Refer to Chap 3.9.5.2.1.10.
- <warning> (O). Refer to Chap 3.9.3.
- <caution> (O). Refer to Chap 3.9.3.
- <note> (O). Refer to Chap 3.9.3.
- <legend> (O). Refer to Chap 3.9.5.2.1.7.
- Text
  - <functionalItemRef> (O). Refer to Chap 3.9.5.2.1.10.
  - <circuitBreakerRef> (O). Refer to Chap 3.9.5.2.1.10.
  - <controlIndicatorRef> (O). Refer to Chap 3.9.5.2.1.10.
  - <inlineSignificantData> (O). Refer to Chap 3.9.5.2.1.10.
  - <quantity> (O). Refer to Chap 3.9.5.2.1.10.
  - <zoneRef> (O). Refer to Chap 3.9.5.2.1.10
  - <accessPointRef> (O). Refer to Chap 3.9.5.2.1.10
  - <identNumber> (O). Refer to Chap 3.9.5.2.1.10
  - <internalRef> (O). Refer to Chap 3.9.5.2.1.10.
  - <indexFlag> (O). Refer to Chap 3.9.5.2.1.10.
  - <changeInline> (O). Refer to Chap 3.9.5.2.1.10.
  - <emphasis> (O). Refer to Chap 3.9.5.2.1.10.
  - <symbol> (O). Refer to Chap 3.9.5.2.1.10.
  - <subScript> (O). Refer to Chap 3.9.5.2.1.10.
  - <superScript> (O). Refer to Chap 3.9.5.2.1.10.
  - <dmRef> (O). Refer to Chap 3.9.5.2.1.10.
  - <pmRef> (O). Refer to Chap 3.9.5.2.1.10.
  - <externalPubRef> (O). Refer to Chap 3.9.5.2.1.10.
  - <footnote> (O). Refer to Chap 3.9.5.2.1.10.
  - <footnoteRef> (O). Refer to Chap 3.9.5.2.1.10.
  - <acronym> (O). Refer to Chap 3.9.5.2.1.10.
  - <acronymTerm> (O). Refer to Chap 3.9.5.2.1.10.
  - <caption> (O). Refer to Chap 3.9.5.2.1.10.
  - <captionGroup> (O). Refer to Chap 3.9.5.2.1.10.
  - <verbatimText> (O). Refer to Chap 3.9.5.2.1.10.
- Lists
  - <orderedList> (O). Refer to Chap 3.9.5.2.1.3.
  - <randomList> (O). Refer to Chap 3.9.5.2.1.3.
  - <definitionList> (O). Refer to Chap 3.9.5.2.1.3.

**Business rules decisions:**

– None identified

**Markup example:**

```
<entry colsep="0"><para>25,00 mm</para></entry>
```

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use of tables as graphics**. The project or the organization must decide if tables represented as graphics are allowed, and if they are the situations in which they can be used. Refer to Para 2.3.

**Use of presentation attributes**. The project or the organization must decide whether or not to include table presentation settings in the authored markup for the element <table> or allow the presentation system to deal with that. Refer to Para 2.5.

**Note**

Basic presentation styles for six specific tables are given in Chap 6.2.2 and Chap 6.2.3 and these should be followed whether the styles are authored or rendered by the display system.

**Use of applicability information**. The project or the organization must decide if the indication of applicability information is permitted on various table subelements depending on the Product configuration. If permitted, then the project or the organization must also decide on the use of the attribute applicRefId for this purpose. Refer to Para 2.5.

# 4 Examples

The following example shows the markup of an S1000D formal table that has five columns and rules as defined in Chap 6.2.2 and Chap 6.3.1. Note that the attributes colsep and rowsep on the element <table> set the default rulings for the entire table (ie no rulings). The attribute frame value of "topbot" draws a rule above and below the table, and the rowsep value of "1" on the <row> of the table header draws a rule before after the header (if the table header contains more than one row, for S1000D formal tables, the rowsep must be on the last row of the table header only. This table will be numbered (because it has a title), and it will appear in the data module's list of tables (because the attribute tocentry is set to a non-zero value).

```
<table frame="topbot" id="tab-0001" colsep="0" rowsep="0"
tocentry="1">
<title>Ring, Bearing Inner (No. 1) - Repair Data</title>
<tgroup cols="5">
<colspec colname="col1" colwidth="1*"/>
<colspec colname="col2" colwidth="1*"/>
<colspec colname="col3" colwidth="1*"/>
<colspec colname="col4" colwidth="1*"/>
<colspec colname="col5"/>
<thead>
<row rowsep="1">
<entry><para>Area</para></entry>
<entry><para>Maximum blend depth</para></entry>
<entry><para>Maximum blend length</para></entry>
<entry><para>Maximum blend width</para></entry>
<entry><para>Maximum number of blends</para></entry>
</row>
</thead>
<tbody>
```

```
<row>
<entry><para>All areas (unless specified differently)
</para></entry>
<entry><para>None</para></entry>
<entry><para>None</para></entry>
<entry><para>None</para></entry>
<entry colsep="0"><para>Blends are not permitted</para></entry>

<entry><para>17,00 mm</para></entry>
<entry><para>Six</para></entry>
</row>
</tbody>
</tgroup>
</table>
```

The example below shows the markup of a formal, image width table.

```
<table frame="topbot" pgwide="1" id="tab-0002">
<title>Ring, Bearing Inner (No. 1) - Repair Data</title>
<tgroup cols="5">
<colspec colname="col1"/>
<colspec colname="col2"/>
<colspec colname="col3"/>
<colspec colname="col4"/>
<colspec colname="col5"/>
<thead>
<row rowsep="1">
<entry colname="col1" colsep="0"><para>Area</para></entry>
<entry colname="col2" colsep="0"><para>Maximum blend
depth</para></entry>
<entry colname="col3" colsep="0"><para>Maximum blend
length</para></entry>
<entry colname="col4" colsep="0"><para>Maximum blend
width</para></entry>
<entry colname="col5" colsep="0"><para>Maximum number of
blends</para></entry>
</row>
</thead>
<tbody>
<row rowsep="0">
<entry colsep="0"><para>A3</para></entry>
<entry colsep="0"><para>0,60 mm</para></entry>
<entry colsep="0"><para>10,00 mm</para></entry>
<entry colsep="0"><para>10,00 mm</para></entry>
<entry colsep="0"><para>Four</para></entry>
</row>
<row rowsep="0">
<entry colsep="0"><para>A4</para></entry>
<entry colsep="0"><para>0,10 mm</para></entry>
```

```
<entry colsep="0"><para>Not applicable</para></entry>
<entry colsep="0"><para>Not applicable</para></entry>
<entry colsep="0"><para>No limit to the quantity. Remove the
high metal only.</para></entry>
</row>
</tbody>
</tgroup>
</table>
```

The example below shows the markup of a column width, informal table.

```
<table id="tab-0003">
<tgroup cols="2">
<colspec colname="col1"/>
<colspec colname="col2"/>
<tbody>
<row rowsep="0">

# 1 General

This chapter contains the definition and use of figures and foldouts from an author's point of view. It gives details about the available elements and attributes and how to use them to establish a connection between data module text and figures.

# 2 Figures and foldouts

## 2.1 Figures

**Description:** This element contains the figure. The figure consists of a title and one or more illustrations sheets and a figure title. It can also contain a legend.

For specific rules and guidance for the preparation of illustrations, refer to Chap 3.9.2.

In all cases, figures must be placed as near as possible to, and preferably immediately following, the related text.

Figure titles must be written in sentence case and must not have a period [.] at the end.

Figure titles must not exceed two lines.

**Note**

For paper based publications and documents, which are produced from data modules, the placement of the figure is given in the data module. There must be no manual attempt to move the figure to another page due to an automatic page break.

An ICN is used to control the production of the illustration. This ICN is used within the data module to identify the associated graphic as described below. Refer to Chap 4.4.

Where appropriate, figures can be divided over a number of illustration sheets. This is achieved using multiple occurrences of the element <graphic> within the element <figure>.

**Markup element**: <figure> (O)

ICN-83007-S1000DXXX-001-01

*Fig 1 Element <figure>*

**Attributes:**

- `applicRefId` (O) , the applicability information. Refer to Chap 3.9.5.3
- `id` (O), the identifier of the <figure> element. Refer to Chap 3.9.5.2.1.2
- `changeMark` (O), `changeType` (O) and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11
- `securityClassification` (O), `commercialClassification` (O) and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6

**Child elements:**

- <title> (M). Refer to Chap 3.9.5.2.1.5
- <graphic> (M). Refer to Para 2.1.1
- <legend> (O) used to contain the legend information related to the figure. Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

```
<figure>
<title>This is a figure title</title>
<graphic>
...
</graphic>
<legend>
...
```

```
</legend>
</figure>
```

### 2.1.1 Graphic

**Description:** This element contains the external entity reference to the illustration file.

**Markup element**: <graphic> (O)

**Attributes:**

- applicRefId (O) , the applicability information. Refer to Chap 3.9.5.3
- id (O), the identifier of the <graphic> element
- changeMark (O), changeType (O) and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1
- infoEntityIdent (M), the link to the external entity declaration, which points to the illustration file. The population of this attribute must include the complete ICN with the prefix "ICN-"
- reproductionWidth (O), used to indicate the presentation width to the presentation system
- reproductionHeight (O), used to indicate the presentation height to the presentation system
- reproductionScale (O), used to indicate the presentation scale to the presentation system
- xlink:type (O), specifies the link type, if an xlink link is established. Refer to Chap 7.7.4.
- xlink:href (O), specifies the link address, if an xlink link is established. Refer to Chap 7.7.4.
- xlink:title (O), specifies the link title, if an xlink link is established. Refer to Chap 7.7.4.
- xlink:show (O), specifies the link appearance, if an xlink link is established. Refer to Chap 7.7.4.
- xlink:actuate (O), specifies the link behavior, if an xlink link is established. Refer to Chap 7.7.4.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11
- securityClassification (O), commercialClassification (O) and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6

**Child elements:**

- <hotspot> (O), used for hotspotting. Refer to Chap 3.9.5.2.1.8.
- <reasonForAmendment> (O), used to contain the reason for amendment information. Refer to Chap 3.9.5.2.1.1.

**Business rules decisions:**

- Use of hotspots

**Markup example:**

```
<graphic>
<hotspot>
...
</hotspot>
<reasonForAmendment>
...
```

```
</reasonForAmendment>
</graphic>
```

### 2.1.2 Legend

**Description:** The element <legend> contains the legend or explanatory list.

**Note**

In the case of multi-sheet illustrations, only one legend is permitted.

**Markup element:** <legend> (O)

**Attributes:**

- id (O), the identifier of the <legend> element. Refer to Chap 3.9.5.2.1.2
- changeMark (O), changeType (O) and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1
- securityClassification (O), commercialClassification (O) and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6

**Child elements:**

- <definitionList> (C). Refer to Chap 3.9.5.2.1.3.

**Business rules decisions:**

- Use of legends
- Decide on the format of entries in the legend

**Markup example:**

```
<legend>
<definitionList>
...
</definitionList>
</legend>
```

## 2.2 Foldouts

**Description:** The element <foldout> is used to contain a figure, or table which is larger than the default size.

**Note**

Use of foldouts for tables is to be avoided.

**Markup element**: <foldout> (O)

**Attributes:**

- None

**Child elements:**

- <figure> (O). Refer to Para 2.1.
- <table> (O). Refer to Chap 3.9.5.2.1.6.

**Business rules decisions:**

- Use of foldouts

**Markup example:**

```
<foldout>
<figure>
...
</figure>
</foldout>
```

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use of hotspots**. The project or the organization must decide whether to use hotspots or not. Refer to Para 2.1.

**Use of applicability**. The project or the organization must decide whether and how to use the attribute `applicRefId` for complete figures and illustration sheets. Refer to Para 2.1.

**Type of legend**. The project or the organization must decide on the strategy for legends. Legends can appear as part of the illustration or as text using the element <`legend`>. The advantage of making the legend part of the text is that:

- the same illustration can have different legends wherever it appears (eg in multi-language projects)
- the text of the element <`legend`> can be searched. This might not be the case if the legend is part of the illustration
- items in the illustration can be linked to the legend by the use of hotspots
- the legend in the text can save space on the illustration (particularly when the legends are long). Refer to Para 2.1.2.

**Format of the entries in the legend**. The project or the organization must define:

- whether the text in the legend is in sentence case (D), uppercase or mixed case
- whether the element <`listItemTerm`> is to contain a leading zero when using callout/item numbers or not. The default is no leading zero. Refer to Para 2.1.2.

**Use of foldout**. The project or the organization must decide whether this element is only used for page-oriented publications, as it will not have an effect in the screen view of an IETP. Refer to Para 2.2.

# 4 Markup examples

## 4.1 Single illustration

The following example shows the markup for a data module that contains a single CGM illustration using the complete ICN in the attribute `infoEntityIdent` and example `ids`.

```
<!DOCTYPE dmodule [
<!ENTITY ICN-S1000DBIKE-AAA-D000000-0-U8025-00536-A-04-1 SYSTEM
"../../../illustrations/ICN-S1000DBIKE-AAA-D000000-0-U8025-
00536-A-04-1.CGM" NDATA cgm>
]>
...
<figure id="fig-0001">
<title>Complete bicycle</title>
<graphic infoEntityIdent="ICN-S1000DBIKE-AAA-D000000-0-U8025-
00536-A-04-1">
</graphic>
</figure>
```

## 4.2 Multiple illustrations

The following example shows the markup for a multiple illustration sheet figure:

```
<figure id="fig-0001">
<title>LP compressor - Removal</title>
<graphic id="fig-0001-gra-0001" infoEntityIdent="ICN-E2-A-
723200-R-K0378-00232-A-01-1">
</graphic>
<graphic id="fig-0001-gra-0002" infoEntityIdent="ICN-E2-A-
723200-R-K0378-00233-A-01-1">
</graphic>
</figure>
```

## 4.3 Legend

The following example shows the markup for a legend:

```
<figure id="fig-0001">
<title>LP compressor - Removal</title>
<graphic id="fig-0001-gra-0001" infoEntityIdent="ICN-E2-A-
723200-R-K0378-00232-A-01-1">
</graphic>
<graphic id="fig-0001-gra-0002" infoEntityIdent="ICN-E2-A-
723200-R-K0378-00233-A-01-1">
</graphic>
<legend>
<definitionList>
<title>Legend for <internalRef internalRefId="fig-0001">
</internalRef>
</title>
<definitionListItem>
<listItemTerm>1</listItemTerm>
<listItemDefinition>DISPLAY</listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm>2</listItemTerm>
<listItemDefinition>BUTTON</listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm>3</listItemTerm>
<listItemDefinition>WIDGET</listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm>4</listItemTerm>
<listItemDefinition>ADAPTOR</listItemDefinition>
</definitionListItem>
...
<definitionListItem>
<listItemTerm>102</listItemTerm>
<listItemDefinition>RETAINER</listItemDefinition>
</definitionListItem>
</definitionList>
</legend>
</figure>
```

## 4.4 Foldout

The following example shows the markup for a foldout illustration:

```
<foldout>
<figure id="fig-0001">
<title>LP compressor - Removal</title>
<graphic infoEntityIdent="ICN-E2-A-723200-R-K0378-00232-A-01-1">
</graphic>
<graphic infoEntityIdent="ICN-E2-A-723200-R-K0378-00233-A-01-1">
</graphic>
</figure>
</foldout>
```

# 1 General

This chapter contains the definition and handling of graphical hotspots from an author's point of view. It gives details about the available elements and attributes and how to use them to establish a connection between data module text and objects within a graphic.

Information and guidance on how to prepare graphics for hyperlinking and navigation, is given in Chap 7.3.2.

# 2 Content

## 2.1 Relationship to CGM V4

The content model of an S1000D CGM version 4 Application Structure (APS) can be described as a recursive definition of a CGM APS parameter `type` with value "`grobject`".

**Note**

All attributes of the CGM APS type value "`grobject`" correspond to CGM APS attributes, except CGM APS parameter `apsid`, which corresponds to the application structure identifier of the CGM APS itself.

## 2.2 Hotspot

**Description:** The element <`hotspot`> contains the definition of graphical regions in an illustration and contains information needed to navigate between graphical objects or between graphical objects and text. For use of the element <`hotspot`> in the context of a learning assessment, refer to Chap 3.9.5.2.13.5.

**Markup element:** <`hotspot`> (O)

**Attributes:**

- `applicRefId` (O), the applicability information. Refer to Chap 3.9.5.3.
- `id` (O), the identifier of the <`hotspot`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `applicationStructureIdent` (O), corresponds to the CGM APS parameter "apsid" and defines a relationship between the hotspot and the graphical object in the illustration
- `applicationStructureName` (O), corresponds to the CGM APS attribute "name" and defines an alternate relationship between the hotspot and the graphical object in the illustration
- `hotspotType` (O), can be used to classify a graphical object. Example values are "`callout`" or "`detail`".
- `hotspotTitle` (O), can be used to provide a context dependent human readable label to be displayed when the graphical cursor passes over a graphical object (tool tip)
- `objectDescr` (O), associates more detailed information with a graphical object

- `objectCoordinates` (O), is used to hold the coordinates of the overlay region as a closed polygon, separated by commas in the form "$x_1$, $y_1$,...,$x_n$, $y_n$" where each (x,y)-pair defines a vertex point of the closed region in absolute pixel coordinates. The coordinate system has its origin (0,0) at the top/left corner of the raster image with the x-axis pointing to the right and the y-axis pointing down.

  **Note**

  The word "closed" means that the last point equals the first one. Thus, a rectangular region is defined by five coordinate pairs. Attribute `objectCoordinates` is only needed for defining externally sensible regions applicable to raster graphics that are not embedded in CGM graphics.

- `visibility` (O), is set to value "`hidden`" to turn off any graphical regions that are not be displayed for the current use of a graphic, otherwise the value is assumed to be "`visible`"

  **Note**

  Summary of visibility/interactivity values for a graphical region:

  - visible, not selectable:
    - Do not define in a hotspot, ie do nothing, or
    - Define a hotspot without any internal references, data module references, or CSN references, or
    - Define a hotspot without any internal references, data module references, or CSN references and attribute `visibility="visible"`
  - visible, selectable:
    - Define a hotspot with at least one internal references, data module references, or CSN reference, or
    - Define a hotspot with at least internal references, data module references, or CSN reference and attribute `visibility="visible"`
  - not visible, not selectable:
    - Define a hotspot with no internal references, data module references, or CSN references and attribute `visibility="hidden"`
  - not visible, selectable:
    - Disallowed
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <`hotspot`> (O). Refer to Para 2.2.
- <`internalRef`> (O). Internal references must be populated in accordance with Chap 3.9.5.2.1.2.
- <`dmRef`> (O). Data module references must be populated in accordance with Chap 3.9.5.2.1.2.
- <`catalogSeqNumberRef`> (O). CSN references must be populated in accordance with Chap 3.9.5.2.7.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of hotspots

**Markup example:**

- Refer to Para 4.

## 2.3 Links to/from graphical objects

Graphical objects can be linked with text, other graphics or graphical objects, other data modules, and parts data in several ways. Links can originate from other objects linking to a graphical object. Links can also originate from graphical objects linking to other objects within the same data module (local), other data modules, or parts data.

If several links exist from the same object then the possible link destinations must be presented as a choice menu to the user when activating the object, eg by clicking on it.

### 2.3.1 Links to graphical objects originating from local text

Graphical objects are addressed from within data module text by using the element <`internalRef`>. The content model of element <`internalRef`> is as described in Chap 3.9.5.2.1.2.

**Note**

In order to allow more flexibility for element <`internalRef`> in data module text, it can have textual content including subscripts and superscripts to highlight link anchors to the end user in viewer applications. This expansion is not required when using element <`internalRef`> within the context of element <`hotspot`>.

Attribute `internalRefId` is used in cases where the link can be expressed by a simple XML ID/IDREF mechanism. This applies to all "outbound" links from data module text to graphical objects, all "inbound" links from a graphical object back to data module text (into the same data module where the graphical object is defined), and all "third-party" links from one graphical object to another.

In cases where attribute `internalRefId` cannot be used, the attribute `referredFragment` contains a Universal Resource Name (URN) reference (including a fragment identifier in the general case) which points to the destination of the link. An example of using attribute `referredFragment` would be to point into an audio/video data stream at a specific location. In this case, attribute `internalRefId` is not used.

The optional attribute `referredFragment` of element <`internalRef`> also covers the possibility of simultaneously addressing all graphical objects within a (multi-sheet) figure with the same value of attribute `applicationStructureName`. The optional attribute `applicationStructureName`, which is replicated in attribute `referredFragment` of element <`internalRef`>, can be used as a shorthand address for all graphical objects defined in a (multi-sheet) figure with that name. In this case, attribute `internalRefId` contains the value of attribute `id` of the corresponding element <`figure`>. This feature is especially useful in parts data modules by providing a link from the textual description of a part to each occurrence of that part in the figure.

The optional attribute `targetTitle` of element <`internalRef`> can be used to provide a human-readable label for the link destination, which will be displayed when for instance the graphical object is activated (eg by a mouse-down event). If element <`internalRef`> is attached to a graphical object more than once, then the possible link destinations (values of attribute `internalRefId` and/or attribute `referredFragment`) and/or the corresponding values of optional attribute `targetTitle` are presented as a choice menu to the user when activating the graphical object, eg by clicking on it.

The value "`hotspot`" of attribute `internalRefTargetType` is necessary to distinguish traditional references to a figure from references into it.

In case of multi-sheet figures, when cross-referencing to/into a single illustration sheet, the attribute `internalRefId` contains the value of attribute `id` of the referenced element <`graphic`>.

**Note**

The attribute `internalRefTargetType` is not mandatory. If the application is able to retrieve the name of the link destination element, then it can perform proper actions based on this looked-up name instead of using the value of the attribute `internalRefTargetType`. In this case, the attribute `internalRefTargetType` does not need to be given.

### 2.3.2 Links originating from graphical objects to local text or graphics

Links from graphical objects to objects within the same data module are expressed by using element <`internalRef`>. The links can be to data module text and/or to other graphic locations of a figure. The element <`internalRef`> is not used for references to another data module.

Use of the element <`internalRef`> follows the rules as described in Para 2.3.1 with the exception that the attribute `internalRefTargetType` is not limited to the value "`hotspot`". The value used accurately represents the type of the destination object.

In cases where attribute `internalRefId` cannot be used, the attribute `referredFragment` will contain a URN reference (including a fragment identifier in the general case) pointing to the destination of the link. An example of using attribute `referredFragment` is to point into an audio/video data stream at a specific location. In this case, attribute `internalRefId` is not used.

### 2.3.3 Links from graphical objects to other data modules

Links from graphical objects to other data modules are expressed by using the element <`dmRef`>.

The use of the element <`dmRef`> follows the rules as described in Chap 3.9.5.2.1.2.

Use of the optional attribute `referredFragment` of element <`dmRef`> covers the possibility of referencing into a figure within a different data module. This can be used, for instance, to provide a graphical navigation capability. Referencing into the middle of procedural data is strongly discouraged as critical warnings, cautions, and setup information can be skipped creating a hazardous condition for personnel and equipment. Refer to Chap 3.9.5.2.1.2.

### 2.3.4 Links from graphical objects to parts data

Links from graphical objects to parts data are expressed by using the element <`catalogSeqNumberRef`>.

The element <`catalogSeqNumberRef`> is used to contain a reference to a parts catalog entry. Refer to Chap 3.9.5.2.7.

## 2.4 XML "authoring"

The manual effort involved in authoring the definition of and the access to graphical objects within data modules and their associated illustrations can be minimized by the use of sufficiently powerful tools both in the CGM graphics and the textual XML environment. An example would be an existing tool, which automatically reads and transforms callout/item numbers/items in the graphic to addressable objects with names and unique identifiers. WebCGM 2.0 supports this approach through the Document Object Model (DOM) interface. Refer to Chap 7.3.2.

## 2.5 Hotspot definition

In general, the major manual effort required to define hotspots must be spent in the graphics environment. Leaving out the simple example above of only defining callout/item numbers/items as graphical objects, the illustrator has to group graphic primitives or has to define a geometric outline embracing them, and must associate address information (a unique identifier and possibly a name) to those potential hotspots.

Depending on the functionality of the CGM export facility in the graphic tool, this address information can be exposed to the textual XML environment for automated insertion of element <`hotspot`> in data module text.

Some further information to be associated with hotspots can be automatically retrievable from within the data module text, such as the value of attribute `hotspotTitle` of element <`hotspot`> (eg from the structural content of element <`legend`>) or predetermined context-dependent link ends originating from that graphical object (eg links back to part numbers in parts information data module text).

In case of separate raster graphics (not embedded in CGM), attribute `applicationStructureIdent` and attribute `applicationStructureName` have no predefined meaning in the graphics environment. As described above, attribute `objectCoordinates` of element <`hotspot`> is used to hold the coordinates of a sensible overlay region associated with the raster image and serves as the "address" for linking into the graphics environment.

**Note**

In the light of possible multiple use of a graphic in different data modules, it has to be clearly stated that not every object (APS in case of CGM) defined in the graphical environment needs to be inserted as element <`hotspot`> in a specific data module, ie only those graphical objects which are addressed by element <`internalRef`> in that specific data module must be defined therein. The graphic itself must not be copied and/or re-identified.

## 2.6 Cross-referencing

As opposed to the definition of hotspots, the insertion of cross-references cannot be automated to the same degree. Nevertheless, some support can be given to "link authors" by the XML editor or by a separate link tool.

**Note**

If the identifiers are semantically meaningful within the data module content (eg attribute `id` of element <`catalogSeqNumber`> in parts information data modules), then an automated cross-referencing process can be achieved.

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use of hotspots**. The project or the organization must decide on whether to use the hotspot mechanism to create intelligent graphics. Refer to Para 2.2.

# 4 Examples

The examples given below are to demonstrate the use of graphical hotspots in the data module text and the CGM illustration. The illustrations shown are not to scale.

## 4.1 Illustration example

ICN-1B-B-291101-M-C0419-00571-A-01-1

*Fig 1 Illustration example - Graphical hotspots*

## 4.2 CGM version 4 file

The following simple example is an extract from the CGM version 4 file of the illustration which shows the APS used for defining the two occurrences of callout number "6" and the single occurrence of callout number "8" as graphical objects. The APS parameter `id` values are "`hot001`", "`hot002`" and "`hot003`". The optional object names are "6" for both occurrences of callout number "6", whereas "`hot003`" is not named, and there are optional picking/highlighting regions (a continuous polybezier and two rectangles) defined for the three graphical objects.

```

The effect when highlighting these graphical objects and bringing them into view (possibly by defining an APS attribute `viewcontext` in addition) by a CGM viewer application can be as shown in the following illustration extract:

ICN-1B-B-291101-M-C0419-00571-B-01-1

*Fig 2 Illustration example - Highlighting graphical objects*

## 4.3 XML companion metadata

### 4.3.1 Hotspot definition

The original XML data module fragment, which defines the figure that corresponds to the illustration example above, looks as follows:

```
<figure id="fig-0001">
<title>Removal of solenoid valve, pump no. 1
```

```
(no. 2)</title>
<graphic infoEntityIdent="ICN-1B-B-291101-M-C0419-00571-A-001-
01">
</graphic>
<legend>
<definitionList>
<definitionListItem>
<listItemTerm>1</listItemTerm><listItemDefinition><para>Electric
al plug 3MRa (5MRa)</para></listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm>2</listItemTerm><listItemDefinition><para>Screw
</para></listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm>3</listItemTerm><listItemDefinition><para>Washer
</para></listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm>4</listItemTerm><listItemDefinition><para>Solenoid
valve</para></listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm>5</listItemTerm><listItemDefinition><para>Locating
pin</para></listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm id="fig-0001-trm-
0001">6</listItemTerm><listItemDefinition><para>O-
Ring</para></listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm>7</listItemTerm><listItemDefinition><para>O-
Ring</para></listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm id="fig-0001-trm-
0002">8</listItemTerm><listItemDefinition><para>Hydraulic
pump</para></listItemDefinition>
</definitionListItem>
</definitionList></legend></figure>
```

After automated insertion of the potential hotspots, the XML data module fragment for element <graphic> looks as follows, where the value "fig001" is the content of attribute id of the parent single-sheet element <figure>:

```
<graphic id="fig-001-gra-0000"
infoEntityIdent="ICN-1B-B-291101-M-C0419-00571-A-001-01">
<hotspot id="fig-0001-gra-0000-hot-0001"
applicationStructureIdent="hot001" applicationStructureName="6"
hotspotTitle="O-Ring">
<internalRef internalRefId="fig-0001-trm-0001"
targetTitle="Explanation"
internalRefTargetType="other"></internalRef></hotspot>
<hotspot id="fig-0001-gra-0000-hot-0002"
applicationStructureIdent="hot002" applicationStructureName="6"
hotspotTitle="O-Ring">
<internalRef internalRefId="fig-0001-trm-0001"
targetTitle="Explanation"
```

```
internalRefTargetType="other"></internalRef></hotspot>
<hotspot id="fig-0001-gra-0000-hot-0003"
applicationStructureIdent="hot003" hotspotTitle="Hydraulic
pump">
<internalRef internalRefId="fig-0001-trm-0002"
targetTitle="Explanation"
internalRefTargetType="other"></internalRef></hotspot></graphic>
```

This initial definition step can be performed, to a certain degree, without manual intervention by extracting the values of attribute `applicationStructureIdent` and optional attribute `applicationStructureName` from the CGM environment, and inserting them in the XML instance.

In this example, the individual value of attribute `hotspotTitle` of element <`hotspot`> is retrieved from element <`legend`>.

**Note**

The individual value of attribute `internalRefId` is an XML identifier that points (back) from the graphical object to the proper location within element <`legend`>.

### 4.3.2 Cross-referencing

For cross-referencing from within data module text to a single graphical object, the XML element <`internalRef`> can be used as follows:

```
<para>See <internalRef internalRefId="fig-0001-gra-0000-hot-
0003" internalRefTargetType="hotspot">item
8</internalRef></para>
```

In order to address both graphical objects named "6" at once, attribute `target` of element <`internalRef`> is used (in addition to attribute `internalRefId` which points to element <`figure`>) in the context of element <`legend`> as follows (emphasized in bold):

```
<legend>
<definitionList>
<definitionListItem>
<listItemTerm>1</listItemTerm><listItemDefinition><para>Electric
al plug 3MRa (5MRa)</para></listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm>2</listItemTerm><listItemDefinition><para>Screw</p
ara></listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm>3</listItemTerm><listItemDefinition><para>Washer</
para></listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm>4</listItemTerm><listItemDefinition><para>Solenoid
valve</para></listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm>5</listItemTerm><listItemDefinition><para>Locating
pin</para></listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm id="fig-0001-trm-0001">6</listItemTerm>
<listItemDefinition><internalRef internalRefId="fig-0001"
referredFragment="6" internalRefTargetType="hotspot">O-
```

```
Ring</internalRef></listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm>7</listItemTerm><listItemDefinition><para>O-
Ring</para></listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm id="fig-0001-trm-0002">8</listItemTerm>
<listItemDefinition><para>Hydraulic
pump</para></listItemDefinition>
</definitionListItem>
</definitionList>
</legend>
```

## 4.4 Separate raster graphics

In order to demonstrate the use of attributes of element <hotspot> in case of separate raster graphics (not embedded in CGM), it is assumed that the above illustration is only available as a TIF, CG4, GIF, PNG or JPG image file.

The XML data module fragment for the definition of the third element <hotspot> within element <graphic> looks then as follows:

```
<hotspot id="fig-0001-gra-0000-hot-0003" hotspotTitle="Hydraulic
pump" objectCoordinates="134,48,134,52,136,52,136,48,134,48">
<internalRef internalRefId="fig-0001-trm-0002"
targetTitle="Explanation"
internalRefTargetType="other"></internalRef></hotspot>
```

**Note**

Attribute `applicationStructureIdent` and attribute `applicationStructureName` are not used in this example.

## 4.5 References between graphical objects

For cross-referencing from one graphical object to another, the element <internalRef> is used within element <hotspot> as follows (building up on the example above):

```
<hotspot id="fig-0001-gra-0000-hot-0001"
applicationStructureIdent="hot001" applicationStructureName="6"
hotspotTitle="O-Ring">
<internalRef internalRefId="fig-0001-trm-0001"
targetTitle="Explanation"
internalRefTargetType="other">></internalRef>
<internalRef internalRefId="fig-0001-gra-0000-hot-0002"
internalRefTargetType="hotspot" targetTitle="Second occurrence
of catalogItemNumber 6"></internalRef></hotspot>
```

In this example, the link from the first to the second occurrence of item number "6" is expressed by another sub element <internalRef> of element <hotspot>.

## 4.6 References from within illustration sheets to other data modules

For cross-referencing from one graphical object to the figure and the XML text of another data module and to parts data, element <internalRef>, element <dmRef> and element <catalogSeqNumberRef> are used within element <hotspot> as follows (building up on the example above):

```
<hotspot id="fig-0001-gra-0000-hot-0003"
applicationStructureIdent="hot003" hotspotTitle="Hydraulic
```

```
pump">
<internalRef internalRefId="fig-0001-trm-0002"
targetTitle="Explanation"
internalRefTargetType="other"></internalRef>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="1B" systemDiffCode="B"
systemCode="24" subSystemCode="4" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="A"
infoCode="130" infoCodeVariant="B" itemLocationCode="A"/>
</dmRefIdent>
<dmRefAddressItems>
<dmTitle>
<techName>Disconnection of power supply</techName>
<infoName>Normal operation</infoName>
</dmTitle>
</dmRefAddressItems>
</dmRef>
<dmRef referredFragment="URN:S1000D:ICN-1B-B-244000-M-C0419-
00123-A-001-01" xlink:type="simple" xlink:actuate="onRequest"
xlink:show="new" xlink:title="Disconnection of power supply -
Figure">
<dmRefIdent>
<dmCode modelIdentCode="1B" systemDiffCode="B"
systemCode="24" subSystemCode="4" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="A"
infoCode="130" infoCodeVariant="B" itemLocationCode="A"/>
</dmRefIdent>
</dmRef>
<catalogSeqNumberRef xlink:type="simple"
xlink:actuate="onRequest" xlink:show="new"
xlink:title="Hydraulic pump XYZ" xlink:href="URN:S1000D:CSN-
53251001-001-00A"
catalogSeqNumberValue="53251001 001 "
itemSeqNumberValue="00A"></catalogSeqNumberRef>
</hotspot>
```

In this example, the second sub element <`dmRef`> of element <`hotspot`> demonstrates the possibility for link definitions from a graphical hotspot to another data module.

The third sub element <`dmRef`> of element <`hotspot`> demonstrates the possibility for link definitions from a graphical hotspot to other resources (ie to another figure), external to the context of a specific data module. This is accomplished by using the attribute `referredFragment` with standard S1000D URN name.

The fourth sub element <`catalogSeqNumberRef`> of element <`hotspot`> demonstrates the possibility for link definitions from a graphical hotspot to a part within an IPD data module. The example includes optional XLink attributes that describe the behavior and title of the link.

In this example, when the graphical hotspot is selected in an IETP, a list of four possible link destinations is presented:

- Explanation - Other
- Disconnection of power supply - Normal operation
- Disconnection of power supply - Figure
- Hydraulic pump XYZ - Parts data

# 1 General

This chapter contains the definition and handling of the sections "Preliminary requirements" and "Requirements after job completion" from an author's point of view. It gives details about the available elements and attributes and how to use them to populate Preliminary requirements and Requirements after job completion.

The rules for the presentation of Preliminary requirements and Requirements after job completion in page-oriented publications and IETP are given in Chap 6.2.3.3 and Chap 6.3.1, respectively.

Preliminary requirements, element <preliminaryRqmts>:

- lists (Required conditions) the actions to be done or conditions that must be satisfied before the Main procedure, element <mainProcedure>, is started
- lists any personnel, required technical information, support equipment, supplies and spares that are needed to perform the Procedure
- gives the safety conditions that apply to the Main procedure and the Requirements after job completion

Basic production maintenance data can also be specified by using in the element <productionMaintData>.

Requirements after job completion, element <closeRqmts>, captures any actions that are required after the Main procedure is complete, to return the Product to a serviceable condition or the conditions that must be satisfied to have the Product in a serviceable condition.

Fig 1 shows the overall construct of the element <preliminaryRqmts> and the element <closeRqmts> in procedural, fault isolation and process data modules. The maintenance planning data modules use only the element <preliminaryRqmts>.

It is recommended to give references to complete data modules only, in Required conditions, element <reqCondGroup>, and in Requirements after job completion, element <closeRqmts>. This enables an automatically preparation of situation adopted maintenance procedures, by compiling all the Preliminary requirements data and actions, and the Requirements after job completion data and actions, together with all Main procedures, consolidated into one complete sequence.

To prescribe a condition by giving an action in the element <preliminaryRqmts> or the element <closeRqmts>, without a reference to a data module, can reduce the possibility for further automated preparation of situation adopted maintenance procedures. The same limitation appears where an action just refers to one or more steps in the referred data module or publication.

The markup examples given in this chapter are presented in Chap 6.2.3.3 in the S1000D standard layout for page oriented presentation.

The graphical representation of the XML schema fragments use specific symbols which are explained in Chap 3.9.5.

ICN- S3627-S1000D0442-001-01

*Fig 1 Element <`preliminaryRqmts`> and element <`closeRqmts`> in a procedural data module*

## 2 Preliminary requirements

**Description:** The element <`preliminaryRqmts`> contains all preliminary requirements for a procedure as described at Para 2.2 thru Para 2.8.

**Markup element:** <`preliminaryRqmts`> (M)

The element is mandatory in procedural and fault isolation data modules and optional in process and maintenance planning data modules. The use of (M/O/C) in the following paragraphs is based on the procedural Schema.

**Attributes:**

– None

**Child elements:**

- <productionMaintData> (O), repeatable. Production management data. Refer to Para 2.1.
- <reqCondGroup> (M), required conditions. Refer to Para 2.2.
- <reqPersons> (O), repeatable. Required persons. Refer to Para 2.3.
- <reqTechInfoGroup> (O), required technical information. Refer to Para 2.4.
- <reqSupportEquips> (M), support equipment. Refer to Para 2.5.
- <reqSupplies> (M), consumables, materials and expendables. Refer to Para 2.6.
- <reqSpares> (M), spares. Refer to Para 2.7.
- <reqSafety> (M), safety conditions. Refer to Para 2.8.

**Business rules decisions:**

- None identified

**Markup example:**

```
<preliminaryRqmts>
<reqCondGroup>

## 2.1 Production maintenance data

**Description:** The element <`productionMaintData`> contains the basic information required for the planning and preparation of the task.

**Markup element:** <`productionMaintData`> (O)

ICN- S3627-S1000D0443-001-01

*Fig 2 Element <`productionMaintData`>*

**Attributes:**

- `applicRefId` (O), the applicability information. Refer to Chap 3.9.5.3.
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.

**Child elements:**

- <`thresholdInterval`> (O), repeatable. The threshold intervals, Refer to Para 2.1.1.
- <`zoneRef`> (O), repeatable. The references to the zones. Refer to Para 2.1.2.
- <`accessPointRef`> (O), repeatable. The references to the access points. Refer to Para 2.1.3.
- <`workArea`> (O), the descriptive identifier of the area where work is accomplished that cannot be deduced from the names of the collection of zones. Refer to Para 2.1.4.
- <`taskDuration`> (O), the maintenance task duration. Refer to Para 2.1.5.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– use of production maintenance data

**Markup example:**

```
<productionMaintData>
<workArea>Stem</workArea>
</productionMaintData>
```

### 2.1.1 Threshold interval

**Description:** The element <thresholdInterval> contains any (one or more) threshold interval information that is relevant to the task. It is populated in the format of threshold or threshold interval value, eg 25 (followed by the value of the attribute unitOfMeasure, eg FH).

**Markup element:** <thresholdInterval> (O), repeatable

**Attributes:**

– thresholdUnitOfMeasure (M), the unit of measurement for the threshold interval. This attribute can have the following values:
  - "th01" thru "th99". Refer to Chap 3.9.6.1.

**Recommendation**: The use of the element <thresholdInterval> can interfere with the same data given in the maintenance planning information data modules. A close coordination must be taken if the same data is given in both the procedure and the maintenance planning information. It is recommended to use the maintenance planning information in preference of the element <thresholdInterval> in each procedural data module.

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– use of the element <thresholdInterval>

**Markup example:**

The following example is a threshold interval indicating 25 flight hours. The attribute thresholdUnitOfMeasure set to "th01" indicates flight hours as specified in Chap 3.9.6.1.

```
<thresholdInterval
thresholdUnitOfMeasure="th01">25</thresholdInterval>
```

The following example is a threshold interval indicating 55 to 60 days. The attribute thresholdUnitOfMeasure set to "th06" indicates flight hours as specified in Chap 3.9.6.1.

```
<thresholdInterval thresholdUnitOfMeasure="th06">55 to
60</thresholdInterval>
```

### 2.1.2 Zone

**Description:** The element <zoneRef> contains the zoning information (one or more), as described in Chap 3.4. For the use of element <zoneRef> in connection with technical information repositories, refer to Chap 4.13.2.

**Markup element:** <zoneRef> (O), repeatable

**Attributes:**

- zoneNumber (O), the zone identifier
- id (O), the identifier of the <zoneRef> element. Refer to Chap 3.9.5.2.1.2.
- lsarData (O), a mark to identify if the reference is derived from a Logistics Support Analysis Record (LSAR) or not. This attribute can have the following values:
  - "0" (D) - No, when not derived from an LSAR
  - "1" - Yes, when derived from an LSAR
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <name> (O), the name of the zone. Refer to Chap 3.9.5.2.1.10.
- <refs> (O). Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of the element <zoneRef>

**Markup example:**

Example of zone with a name, zone number and indicating the use of LSAR data.

```
<zoneRef lsarData="1" zoneNumber="500">
<name>Left wing</name>
</zoneRef>
```

### 2.1.3 Access point

**Description:** The element <accessPointRef> describe/identify any (one or more) access points like panels, doors, hatches. The identifier of the access point is given either through the attribute accessPointNumber or the element <name> element <refs>. For the use of element <accessPointRef> in connection with technical information repositories, refer to Chap 4.13.2.

**Markup element:** <accessPointRef> (O), repeatable

**Attributes:**

- id (O), the identifier of the <accessPointRef> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- accessPointNumber (O), the identifier of the access point

- accessPointTypeValue (O), the access point type. This attribute can have the following values:
  - "accpnl01" - "accpnl99". Refer to Chap 3.9.6.1.
- lsarData (C), a mark to identify if the reference is derived from an LSAR or not. This attribute can have the following values:
  - "0" (D) - No, when not derived from an LSAR
  - "1" - Yes, when derived from an LSAR
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <name> (O), the name of the zone. Refer to Chap 3.9.5.2.1.10.
- <refs> (O). Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of the element <accessPointRef>

**Markup example:**

Example of an access point with a name, access point number, and indicating the use of LSAR data.

```
<accessPointRef accessPointNumber="2514VU" lsarData="1">
<name>Panel A</name>
</accessPointRef>
```

### 2.1.4 Work area

**Description:** The element <workArea> contains a descriptive identifier of the area where work is accomplished that cannot be deduced from the names of the collection of zones.

**Markup element:** <workArea> (O)

**Attributes:**

- None

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of the element <workArea>

**Markup example:**

```
<workArea>Nose cowl</workArea>
```

### 2.1.5 Maintenance task duration

**Description:** The element <taskDuration> contains the (one) elapsed time necessary to achieve the maintenance action.

**Markup element:** <taskDuration> (O)

**Attributes:**

- id (O), the identifier of the <taskDuration> element. Refer to Chap 3.9.5.2.1.2.
- unitOfMeasure (M), the unit of measure
- startupDuration (M), the duration for performing Preliminary requirements
- procedureDuration (M), the duration for performing the Procedure
- closeupDuration (M), the duration for performing the Requirements after job completion

The durations must be composed of maximum four numeric characters including the decimal separator. This value must be given in hours and tenths of an hour. The time unit is manhour corresponding to a workload for **one man** during one hour.

The total elapsed time for the maintenance task is built up by populating all three attributes startupDuration, procedureDuration and closeupDuration.

**Recommendation**: The use of the element <taskDuration> can interfere with the same data given in the maintenance planning information data modules. A close coordination must be taken if the same data is given in both the procedure and the maintenance planning information. It is recommended to use the maintenance planning information in preference of the element <taskDuration> in each procedural data module.

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of the element <taskDuration>

**Markup example:**

```
<taskDuration closeupDuration="0.5" procedureDuration="3.0"
startupDuration="1.5" unitOfMeasure="h"/>
```

## 2.2 Required conditions

**Description:** This element <reqCondGroup> contains any required conditions information. Required conditions are actions to be done and/or conditions that must be satisfied before the Procedure which is the subject of the data module is started.

**Markup element:** <reqCondGroup> (M)

ICN- S3627-S1000D0444-A-01-1

*Fig 3 Element <reqCondGroup>*

**Attributes:**

– None

**Child elements:**

– <noConds> (C). Refer to Para 2.2.1.

or one or more of the following:

– <reqCondNoRef> (C), any simple action/condition with no referenced data module or technical publication. Refer to Para 2.2.2.
– <reqCondCircuitBreaker> (C), the circuit breaker actions/conditions. Refer to Para 2.2.3.1.1.
– <reqCondDm> (C), any actions/conditions referenced to a data module. Refer to Para 2.2.3.
– <reqCondPm> (C), any actions/conditions referenced to a publication module. Refer to Para 2.2.6.
– <reqCondExternalPub> (C), any actions/conditions referenced to a non S1000D publication. Refer to Para 2.2.7.

In process data modules, each element can also include the element <variablePostSet> used to update the state information about the state of the Product. For example, if there were a required condition that Door 12 is Open, at some point an assertion can be made to the state information that Door 12 is open which can then impact maintenance instructions to follow. Refer to Chap 3.9.5.2.10.

**Note**

The required actions/conditions must be listed in the order that they must be carried out to accomplish the Procedure.

**Business rules decisions:**

– None identified

**Markup example:**

```
<reqCondGroup>
<reqCondNoRef>
<reqCond>The bicycle is outdoors.</reqCond>
```

```
</reqCondNoRef>
</reqCondGroup>
```

### 2.2.1 No conditions

**Description:** The element <noConds> contains the "marker" for no required actions/conditions. If there are no required actions/conditions for the Procedure then the element <noConds> must be used.

**Markup element:** <noConds> (C)

**Note**

When a data module is formatted, the element <noConds> generates the word "None".

For page-oriented presentation "None" is given in the Title/Condition column of the Required conditions table.

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<reqCondGroup>
<noConds/>
</reqCondGroup>
```

### 2.2.2 Required condition - simple action/condition

**Description:** The element <reqCondNoRef> contains the action/condition on its own with no referenced data module or technical publication to represent a simple one step action/condition that does not require further explanation.

The text of a required action must be written as an instruction that can be carried out, by a trained mechanic, without any additional information. For example, write "Remove the blanks from all orifices" or "Make sure the blanks are removed from all orifices".

The text of a required condition must be written as a statement that can be evaluated true or false. For example, write "The blanks are removed from all orifices".

**Markup element:** <reqCondNoRef> (C)

ICN- S3627-S1000D0526-A-01-1

*Fig 4 Element <reqCondNoRef>*

**Attributes:**

- `applicRefId` (O), the applicability information. Refer to Chap 3.9.5.3.
- `id` (O), the identifier of the <`reqCondNoRef`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <`reqCond`> (C), refer to Para 2.2.3.1.1.

**Business rules decisions:**

- None identified

**Markup example:**

```
<reqCondNoRef>
<reqCond>The bicycle is outdoors</reqCond>
</reqCondNoRef>
```

### 2.2.3 Required conditions - referenced data module

**Description:** The element <`reqCondDm`> contains the required action/condition when satisfied by completing a Procedure that is described in a separate data module.

The element <`reqCondDm`> is used to describe the required action/condition and the element <`dmRef`> to contain the reference to the data module that gives the Procedure to fulfill the condition.

The required action/condition must be equivalent to the full Procedure in the referenced data module.

The text of a required action must be written as a statement that can be carried out, by a trained mechanic, with support of the referenced data module if needed. For example, write "Make the engine safe for maintenance".

The text of a required condition must be written as a statement that can be evaluated true or false with support of the referenced data module if needed. For example, write "The engine is safe for maintenance" or "Make sure the engine is safe for maintenance".

**Markup element:** <reqCondDm> (C)

ICN- S3627-S1000D0527-001-01

*Fig 5 Element <reqCondDm>*

**Attributes:**

– Includes the same set of attributes as the element <reqCondNoRef>. Refer to Para 2.2.2.

**Child elements:**

– <reqCond> (C). Refer to Para 2.2.3.1.1.
– <dmRef> (C). Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

– None identified

**Markup example:**

```
<reqCondDm>
<reqCond>The tire is removed.</reqCond>
<dmRef xlink:type="simple" xlink:actuate="onRequest"
xlink:show="replace" xlink:href="URN:S1000D:">
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE"  systemDiffCode="AAA"
systemCode="DA0"  subSystemCode="1"  subSubSystemCode="0"
assyCode="20"  disassyCode="00"  disassyCodeVariant="AA"
infoCode="215"  infoCodeVariant="A"  itemLocationCode="A">
</dmCode>
</dmRefIdent>
</dmRef>
</reqCondDm>
```

*2.2.3.1.1 Required condition*

**Description:** The element <reqCond> contains the required action/condition statement, such as "Open the circuit breaker:" or "Make sure the circuit breaker is open, safetied/locked and tagged:" (which might require a separate Procedure).

**Markup element:** <reqCond> (C)

**Attributes:**

- `applicRefId` (O), the applicability information. Refer to Chap 3.9.5.3.
- `reqCondCategory`, the category of the condition, eg special environmental conditions such as reduced lighting, ventilation, and temperature. The attribute can have the following values:
  - "`rcc01`" thru "`rcc99`". Refer to Chap 3.9.6.1.

**Child elements:**

- <`internalRef`> (O). Refer to Chap 3.9.5.2.1.10.
- <`indexFlag`>(O). Refer to Chap 3.9.5.2.1.10.
- <`symbol`>(O). Refer to Chap 3.9.5.2.1.10.
- <`subScript`>(O). Refer to Chap 3.9.5.2.1.10.
- <`superScript`>(O). Refer to Chap 3.9.5.2.1.10.
- <`footnoteRef`> (O). Refer to Chap 3.9.5.2.1.10.
- <`acronym`> (O). Refer to Chap 3.9.5.2.1.10.
- <`acronymTerm`> (O). Refer to Chap 3.9.5.2.1.10.

**Business rules decisions:**

- None identified

**Markup example:**

```
<reqCond>The tire is removed.</reqCond>
```

### 2.2.4 Required conditions - circuit breaker list

**Description:** The element <`reqCondCircuitBreaker`> contains a set of circuit breaker actions (open or close)/conditions (open or closed) before the performance of the task.

**Markup element:** <`reqCondCircuitBreaker`> (C)

ICN- S3627-S1000D0528-001-01

*Fig 6 Element <`reqCondCircuitBreaker`>*

**Attributes:**

- Includes the same set of attributes as the element <`reqCondNoRef`>. Refer to Para 2.2.2.

**Child elements:**

- <`reqCond`> (C). Refer to Para 2.2.3.1.1.
- <`circuitBreakerDescrGroup`> (C). Refer to Para 2.2.5.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of list of the element <`reqCondCircuitBreaker`>

**Markup example:**

```
<reqCondCircuitBreaker>
<reqCond>Make sure the circuit breaker is open, safetied/locked
and tagged.</reqCond>
</reqCondCircuitBreaker>
```

### 2.2.5 Circuit breaker description group

**Description:** The element <circuitBreakerDescrGroup> contains the circuit breaker lists information.

**Markup element:** <circuitBreakerDescrGroup> (C)

ICN- S3627-S1000D0445-001-01

*Fig 7 Element <circuitBreakerDescrGroup>*

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the <circuitBreakerDescrGroup> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- circuitBreakerAction (O), the action to perform on the whole set of circuit breaker described in the table. This attribute can have the following values:
  - "open" - the action "to open"
  - "close" - the action "to close"
  - "verify-open" - the check of the condition: "is open"
  - "verify-closed" - the check of the condition: "is closed"
- checkSum (O), the entered data which allows potential integrity verification
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <circuitBreakerDescrSubGroup> (C)

**Business rules decisions:**

- None identified

**Markup example:**

```
<circuitBreakerDescrGroup circuitBreakerAction="open">
<circuitBreakerDescrSubGroup>
<circuitBreakerDescr>
<circuitBreakerRef circuitBreakerNumber="42RT"
circuitBreakerType="elmec">
</circuitBreakerRef>
<name>MMR-1 (ILS+GPS)</name>
<circuitBreakerLocation>0867</circuitBreakerLocation>
</circuitBreakerDescr>
<circuitBreakerDescr>
<circuitBreakerRef circuitBreakerNumber="800RT"
circuitBreakerType="elmec">
</circuitBreakerRef>
<name>GLIDE ANT2 SWGT RELAY</name>
<circuitBreakerLocation>SSPC</circuitBreakerLocation>
</circuitBreakerDescr>
</circuitBreakerDescrSubGroup>
</circuitBreakerDescrGroup>
```

*2.2.5.1.1 Circuit breaker description subgroup*

**Description:** The element <`circuitBreakerDescrSubGroup`> contains one or more sub circuit breaker lists.

**Markup element:** <`circuitBreakerDescrSubGroup`> (C)

**Attributes:**

- `circuitBreakerAction` (O), the action to perform on the whole set of circuit breaker described in the table. This attribute can have the following values:
  - "`open`" - the action "to open"
  - "`close`" - the action "to close"
  - "`verify-open`" - the check of the condition: "is open"
  - "`verify-closed`" - the check of the condition: "is closed"
- `checkSum` (O), the entered data which allows potential integrity verification
- `applicRefId` (O), the applicability information. Refer to Chap 3.9.5.3.
- `id` (O), the identifier of the <`circuitBreakerDescrGroup`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <`functionalItemRef`> (O) which indicates the particular context for this set of circuit breakers as described in Chap 3.9.5.1.
- <`circuitBreakerDescr`> (C) describing each circuit breaker. Refer to Para 2.2.5.1.2.

**Business rules decisions:**

- None identified

**Markup example:**

```
<circuitBreakerDescrSubGroup>
<circuitBreakerDescr>
<circuitBreakerRef circuitBreakerNumber="42RT"
circuitBreakerType="elmec">
</circuitBreakerRef>
<name>MMR-1 (ILS+GPS)</name>
<circuitBreakerLocation>0867</circuitBreakerLocation>
</circuitBreakerDescr>
<circuitBreakerDescr>
<circuitBreakerRef circuitBreakerNumber="800RT"
circuitBreakerType="elmec">
</circuitBreakerRef>
<name>GLIDE ANT2 SWGT RELAY</name>
<circuitBreakerLocation>SSPC</circuitBreakerLocation>
</circuitBreakerDescr>
</circuitBreakerDescrSubGroup>
```

2.2.5.1.2 *Circuit breaker description*

**Description:** The element <`circuitBreakerDescr`> contains the information on individual circuit breakers.

**Markup element:** <`circuitBreakerDescr`> (C)

ICN- S3627-S1000D0529-001-01

*Fig 8 Element <`circuitBreakerDescr`>*

**Attributes:**

- `applicRefId` (O), the applicability information. Refer to Chap 3.9.5.3.
- `id` (O), the identifier of the <`circuitBreakerDescr`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <circuitBreakerRef> (C), the circuit breaker number, circuit breaker action and circuit breaker type. Refer to Para 2.2.5.1.3.
- <name> (C), the name of the circuit breaker. Refer to Chap 3.9.5.2.1.10.
- <internalRef> (O), the cross-reference to the access point introduced in the product management data, element <productionMaintData>
- <accessPointRef> (O), the identifier of the access point allowing to manipulate the circuit breaker. Refer to Para 2.1.3.
- <circuitBreakerLocation> (O), the circuit breaker location in the circuit breaker panel by entering text. Refer to Para 2.2.5.1.4.

**Business rules decisions:**

- None identified

**Markup example:**

```
<circuitBreakerDescr>
<circuitBreakerRef circuitBreakerNumber="42RT"
circuitBreakerType="elmec">
</circuitBreakerRef>
<name>MMR-1 (ILS+GPS)</name>
<circuitBreakerLocation>0867</circuitBreakerLocation>
</circuitBreakerDescr>
```

**Markup example:**

```
<circuitBreakerDescr>
<circuitBreakerRef circuitBreakerNumber="800RT"
circuitBreakerType="elmec">
</circuitBreakerRef>
<name>GLIDE ANT2 SWGT RELAY</name>
<circuitBreakerLocation>SSPC</circuitBreakerLocation>
</circuitBreakerDescr>
```

*2.2.5.1.3 Circuit breaker reference*

**Description:** The element <circuitBreakerRef> contains the details about the circuit breaker, eg number, circuit breaker action and circuit breaker type.

**Markup element:** <circuitBreakerRef> (C)

**Attributes:**

- id (O), the identifier of the <circuitBreakerRef> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- circuitBreakerNumber (C), the circuit breaker identifier (number)
- circuitBreakerType (O), the circuit breaker type. The attribute can have the following values:
  - "eltro" - electronic circuit breakers
  - "elmec" - electro mechanic circuit breakers
  - "clip" - dummy circuit breakers for provisioning use
- circuitBreakerAction (O), the action to perform on the whole set of circuit breaker described in the table. This attribute can have the following values:
  - "open" - the action "to open"
  - "close" - the action "to close"

- "verify-open" - the check of the condition: "is open"
- "verify-closed" - the check of the condition: "is closed"

– checkSum (O), the entered data which allows potential integrity verification
– authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– <name> (O), the name of the zone. Refer to Chap 3.9.5.2.1.10.
– <refs> (O). Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

– None identified

**Markup example:**

```
<circuitBreakerRef circuitBreakerNumber="42RT"
circuitBreakerType="elmec">
</circuitBreakerRef>
```

*2.2.5.1.4 Circuit breaker location*

**Description:** The element <circuitBreakerLocation> contains the textual description of the circuit breaker location in the circuit breaker panel.

**Markup element:** <circuitBreakerLocation> (O)

**Attributes:**

– id (O), the identifier of the <circuitBreakerLocation> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<circuitBreakerLocation>0867</circuitBreakerLocation>
```

– Required conditions - circuit breaker list - Markup example

Example 1: Access point identifier given by element <accessPointRef>

```
<reqCondCircuitBreaker>
<reqCond>Make sure the circuit breaker is open, safetied/locked
and tagged:</reqCond>
<circuitBreakerDescrGroup circuitBreakerAction="open">

### 2.2.6 Required conditions - referenced publication module

**Description:** The element <reqCondPm> contains the required action/condition when they are contained in another publication module.

The element <reqCond> is used to describe the required action/condition and the element <pmRef> to contain the publication module identifier.

**Note**

The use of element <reqCondPm> needs a clear reference to the procedure needed to do the action or fulfill the condition. A general reference to eg a component maintenance publication can hinder the mechanic to do the job and also the automated generation of situation adopted maintenance procedures.

**Markup element:** <reqCondPm> (C)

**Attributes:**

– Includes the same set of attributes as the element <circuitBreakerDescr>. Refer to Para 2.2.5.1.2.

**Child elements:**

– <reqCond> (C). Refer to Para 2.2.3.1.1.
– <pmRef> (C). Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

– None identified

**Markup example:**

```
<reqCondPm>
<reqCond>Gather the following publication.</reqCond>
```

```
<pmRef>
<pmRefIdent>
<pmCode modelIdentCode="FRIGATE124ALFA" pmIssuer="01233"
pmNumber="01234"
pmVolume="01"/>
</pmRefIdent>
</pmRef>
</reqCondPm>
```

### 2.2.7 Required conditions - referenced non S1000D publication or document

**Description:** The element <reqCondExternalPub> contains the required action/condition when are contained in a non S1000D publication or document.

The element <reqCond> is used to describe the required action/condition and the element <externalPubRef> to contain the publication or document identifier.

**Note**

The use of element <reqCondExternalPub> needs a clear reference to the procedure needed to do the action or fulfill the condition. A general reference to eg a component maintenance publication can hinder the mechanic to do the job and also the automated generation of situation adopted maintenance procedures.

**Markup element:** <reqCondExternalPub> (C)

**Attributes:**

– Includes the same set of attributes as the element <circuitBreakerDescr>. Refer to Para 2.2.5.1.2.

**Child elements:**

– <reqCond> (C). Refer to Para 2.2.3.1.1.
– <externalPubRef> (C). Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

– None identified

**Markup example:**

```
<reqCondExternalPub>
<reqCond>Safely discard the horn that you removed</reqCond>
<externalPubRef><externalPubRefIdent><externalPubTitle>Local
Disposal Procedures</externalPubTitle>
</externalPubRefIdent></externalPubRef>
</reqCondExternalPub>
```

## 2.3 Required persons

**Description:** The element <reqPersons> contains the information on the required personnel for the task.

A program can choose to identify the number of a certain skill (category, skill level, trade) that is required. A program choosing this method must use the element <personnel> in conjunction with the attribute numRequired.

If there are requirements for a specific man, then the element <person> must be used. This element has the attribute man, which must be used to indicate the particular person (eg man "B"). This method identifies each person required to do the Procedure together with the

appropriate information as defined by the project: category, skill level, trade/trade code and estimated time spent per person.

If none of the element <reqPersons> is used this will be regarded as "As required".

Required persons can be represented by a mix of populated element <reqPersons> and element <person>.

**Markup element:** <reqPersons> (O)

ICN- S3627-S1000D0530-001-01

*Fig 9 Element <reqPersons>*

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the <circuitBreakerDescr> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <personnel> (O), the required personnel when the number of a certain skill is required. Refer to Para 2.3.1.

– <person> (O), the required personnel when skill per individual is required. Refer to Para 2.3.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– use of element <reqPersons>

**Markup example:**

```
<reqPersons>
<person man="A"></person>
</reqPersons>
```

### 2.3.1 Personnel

**Description:** The element <personnel> contains the information on the required personnel for the task by grouping the personnel by category, skill level and trade/trade code together with the number of personnel of a certain skill (category, skill level, trade).

If the number of personnel of a specific category, skill level or trade is not defined in the element <person> the absence of a specified quantity indicates as "As required".

**Note**

At page oriented presentation "As required" is given in the Person column of the Required persons table.

If the attribute numRequired is used, then the number required will be presented with the skill level in parentheses.

**Markup element:** <personnel> (O)

**Attributes:**

– id (O), the identifier of the <personnel> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– numRequired (O), the number of personnel for a certain combination of category, skill level and trade
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– <personCategory> (O), refer to Para 2.3.1.1.1.
– <personSkill> (O) refer to Para 2.3.1.1.2.
– <trade> (O) refer to Para 2.3.1.1.3.
– <estimatedTime> (O) refer to Para 2.3.1.1.4.

**Business rules decisions:**

– None identified

**Markup example:**

```
<personnel numRequired="2">
<personCategory personCategoryCode="Electrician"/>
<personSkill skillLevelCode="sk01"/>
<trade>AF901</trade>
```

```
<estimatedTime unitOfMeasure="h">1,5</estimatedTime>
</personnel>
```

*2.3.1.1.1 Category*

**Description:** The element <personCategory> contains the required category level of the person.

**Markup element:** <personCategory> (O)

**Attributes:**

- id (O), the identifier of the <personCategory> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- personCategoryCode (C), the typed in category level of the person
- numRequired (O), the number of personnel for a certain combination of category, skill level and trade
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- values for the attribute personCategoryCode

**Markup example:**

```
<personCategory personCategoryCode="Electrician"/>
```

*2.3.1.1.2 Skill level*

**Description:** The element <personSkill> contains the required skill level of the person. This represents the skill level that the person must have attained to be able to perform his or her role in the Procedure and is, eg Basic, Intermediate or Advanced.

**Markup element:** <personSkill> (O)

**Attributes:**

- id (O), the identifier of the <personSkill> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- skillLevelCode (C), the skill level of the person. The attribute can have the following values:
  - "sk01" thru "sk99". Refer to Chap 3.9.6.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- None

**Business rules decisions:**

– None identified

**Markup example:**

```
<personSkill skillLevelCode="sk01"/>
```

2.3.1.1.3 *Trade/trade code*

**Description:** The element <trade> contains the typed in required trade code of the person. Care must be taken when using this element when the product is, for example, multi-national or multi-customer. The trade or trade code or both is typed in.

**Markup element:** <trade> (O)

**Attributes:**

– id (O), the identifier of the <personSkill> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– list of trade codes

**Markup example:**

```
<trade>AF901</trade>
```

2.3.1.1.4 *Estimated time*

**Description:** The element <estimatedTime> contains the estimate of the time that the person will be required on the task. The time must be given in hours with one decimal, eg 2,4 h, or days, eg 1,5 d. The time and unit of measurement must be entered.

**Markup element:** <estimatedTime> (O)

**Attributes:**

– unitOfMeasure (C), the unit of measure
– id (O), the identifier of the <personSkill> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<estimatedTime unitOfMeasure="h">1,5</estimatedTime>
```

## 2.3.2 Person

**Description:** The element <person> contains the skill information on the required personnel for the task when there are requirements to individually specify the personnel.

Each person must be given an identifier in the attribute man. Eg A, B and C to represent "Man A", "Man B" and "Man C" respectively.

**Note**

The use of element <person> generates at presentation the word "Man" before the value of attribute man. At page-oriented presentation "Man A", etc, is given in the Person column of the Required persons table.

**Note**

The Procedure must be written from the point of view of "Man A".

**Markup element:** <person> (O)

**Attributes:**

- id (O), the identifier of the <person> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- man (O), the alphabetic identifier of the person, starting from A
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- Includes the same set of subelements as the element <personnel>. Refer to Para 2.3.1.

**Business rules decisions:**

- None identified

**Markup example:**

```
<person man="A">
<personCategory personCategoryCode="Electrician"/>
<personSkill skillLevelCode="sk02"/>
<trade>AF901</trade>
<estimatedTime unitOfMeasure="h">1,5</estimatedTime>
</person>
```

Markup using the element <person>:
In the following example, Man A is required for 1,5 hours and is an electrician (represented in this project by the category Electrician) of basic skill level (represented by the attribute value "sk01"). Electricians have the trade code AF901.

Man B is a propulsion engineer (represented in this project by the category code PE) who is required for 2,5 hours. Man B must be of intermediate skill level (represented by the attribute value "sk02"). The trade code for propulsion engineers is AF903.

Supervisors (as many as required to monitor and check the task) are required. These must be of advanced skill level (represented in this project by attribute value "sk03"). The trade code AF092 represents supervisors.

```
<reqPersons>
<personnel>
<personCategory personCategoryCode="SPRVR"/>
<personSkill skillLevelCode="sk03"/>
<trade>AF092</trade>
</personnel>
<person man="A">
<personCategory personCategoryCode="Electrician"/>
<personSkill skillLevelCode="sk01"/>
<trade>AF901</trade>
<estimatedTime unitOfMeasure="h">1,5</estimatedTime>
</person>
<person man="B">
<personCategory personCategoryCode="PE"/>
<personSkill skillLevelCode="sk02"/>
<trade>AF903</trade>
<estimatedTime unitOfMeasure="h">2,5</estimatedTime>
</person>
<personnel>
<personCategory personCategoryCode="SPRVR"/>
<personSkill skillLevelCode="sk03"/>
<trade>AF902</trade>
</personnel>
</reqPersons>
```

## 2.4 Required technical information

**Description:** The element <reqTechInfoGroup> contains references to any technical documents that are required, in addition to the actual data module, for the maintainer to complete the procedure. The list is not a reference list but can be equated to a special tool that needs to be selected. For example, required technical info can be engineering drawings not included in the data module that the maintainer needs to check out of a drawing library in order to complete the maintenance tasks.

**Markup element:** <reqTechInfoGroup> (O)

ICN-S3627-S1000D0531-001-01

*Fig 10 Element <reqTechInfoGroup>*

**Attributes:**

– None

**Child elements:**

– <reqTechInfo> (M). Refer to Para 2.4.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– use of the element <reqTechInfoGroup>

**Markup example:**

```
<reqTechInfoGroup>
<reqTechInfo>
<externalPubRef>
<externalPubRefIdent>
<externalPubTitle>Power Supply Schematic
(132E470092)</externalPubTitle>
</externalPubRefIdent>
</externalPubRef>
</reqTechInfo>
</reqTechInfoGroup>
```

### 2.4.1 Required technical information

**Description:** The element <reqTechInfo> contains the content of <reqTechInfoGroup>.

**Markup element:** <reqTechInfo> (O)

**Attributes:**

– reqTechInfoCategory, (O), the type of information. The attribute can have the following values:
  - "ti01" thru "ti99". Refer to Chap 3.9.6.1.

**Child elements:**

– <dmRef> (O), refer to Chap 3.9.5.2.1.2.
– <pmRef> (O), refer to Chap 3.9.5.2.1.2.
– <externalPubRef>(O), refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

– None identified

**Markup example:**

```
<reqTechInfo>
<externalPubRef>
<externalPubRefIdent>
<externalPubTitle>Power Supply Schematic
(132E470092)</externalPubTitle>
</externalPubRefIdent>
</externalPubRef>
</reqTechInfo>
```

## 2.5 Required support equipment

**Description:** The element <reqSupportEquips> must contain information to list any support equipment including special tools, required to accomplish the Procedure contained in the data module. Common types of test equipment such as voltmeters, signal generators and

continuity testers must be listed. Common tools that are part of a standard tool kit must not be listed.

Support equipment must be identified by the name of the support equipment, identification and a quantity. As an identification number, the CSN/ISN identifier given in S2000M is recommended in order to provide a direct link to the IPD at the relevant location.

If there is no support equipment required, then the element <noSupportEquips> must be used.

**Note**

The use of element <noSupportEquips> generates at presentation "None". At page-oriented presentation "None" is given in the Name column of the Support equipment table.

**Markup element:** <reqSupportEquips> (M)

ICN-S3627-S1000D0447-001-01

*Fig 11 Element <reqSupportEquips>*

**Attributes:**

– None

**Child elements:**

– <noSupportEquips> (O), the indicator of no required support equipment as given in the description above
– <supportEquipDecsrGroup> (O), contains one or more of the element <supportEquipDescr> (C). Refer to Para 2.5.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– listing of common and standard tools

**Markup example:**

```
<reqSupportEquips>
<supportEquipDescrGroup>
<supportEquipDescr id="seq-0001">
<name>Specialist toolset</name>
<identNumber>
<manufacturerCode>KZ666</manufacturerCode>
<partAndSerialNumber>
<partNumber>BSK-TLST-001</partNumber>
</partAndSerialNumber>
</identNumber>
<reqQuantity unitOfMeasure="EA">1</reqQuantity>
```

```
</supportEquipDescr>
</supportEquipDescrGroup>
</reqSupportEquips>
```

The following example, using a CSN reference, shows two support equipment items that are required:

```
<reqSupportEquips>
<supportEquipDescrGroup>
<supportEquipDescr id="seq-0001">
<name>Extractor, Left-handed, Puller</name>
<catalogSeqNumberRef catalogSeqNumberValue="11223301 002A"/>
<reqQuantity unitOfMeasure="EA">1</reqQuantity>
</supportEquipDescr>
<supportEquipDescr id="seq-0002">
<name>Extractor, Right-handed, Puller</name>
<catalogSeqNumberRef catalogSeqNumberValue="11223301 001 "
itemSeqNumberValue="00A"/>
<reqQuantity unitOfMeasure="EA">1</reqQuantity>
</supportEquipDescr>
</supportEquipDescrGroup>
</reqSupportEquips>
```

The following example, using a NATO stock number identification, shows two support equipment items that are required:

```
<reqSupportEquips>
<supportEquipDescrGroup>
<supportEquipDescr id="seq-0028">
<name>Extractor, D-Puller, Left-hand</name>
<natoStockNumber>4920991234567</natoStockNumber>
<identNumber> <manufacturerCode>K0378</manufacturerCode>
<partAndSerialNumber>
<partNumber>JJ134252</partNumber></partAndSerialNumber>
</identNumber>
<reqQuantity unitOfMeasure="EA">1</reqQuantity>
</supportEquipDescr>
<supportEquipDescr id="seq-0312">
<name>Extractor, D-Puller, Right-hand</name>
<natoStockNumber>4290991234561</natoStockNumber>
<reqQuantity unitOfMeasure="EA">1</reqQuantity>
</supportEquipDescr>
</supportEquipDescrGroup>
</reqSupportEquips>
```

The following example, using a NATO stock number identification broken into its constituent parts, together with a part number:

```
<reqSupportEquips>
<supportEquipDescrGroup>
<supportEquipDescr id="seq-0212">
<name>Extractor, D-Puller, Left-hand</name>
<natoStockNumber natoSupplyClass="4920"
natoCodificationBureau="99" natoItemIdentNumberCore="1234567"/>
<identNumber> <manufacturerCode>K0378</manufacturerCode>
<partAndSerialNumber><partNumber>JJ134252</partNumber>
</partAndSerialNumber></identNumber>
<reqQuantity unitOfMeasure="EA">1</reqQuantity>
</supportEquipDescr>
<supportEquipDescr id="seq-0041">
<name>Extractor, D-Puller, Right-hand</name>
```

```
<natoStockNumber natoSupplyClass="4290"
natoCodificationBureau="99" natoItemIdentNumberCore="1234561"/>
<identNumber> <manufacturerCode>K0378</manufacturerCode>
<partAndSerialNumber><partNumber>JJ134259</partNumber>
</partAndSerialNumber></identNumber>
<reqQuantity unitOfMeasure="EA">1</reqQuantity>
</supportEquipDescr>
</supportEquipDescrGroup>
</reqSupportEquips>
```

The following example, using a part number identification, shows two support equipment items that are required:

```
<reqSupportEquips>
<supportEquipDescrGroup>
<supportEquipDescr id="seq-0101">
<name>Extractor, Left-handed, Puller</name>
<identNumber><manufacturerCode>K0378</manufacturerCode>
<partAndSerialNumber><partNumber>JJ123452</partNumber>
</partAndSerialNumber></identNumber>
<reqQuantity unitOfMeasure="EA">1</reqQuantity>
</supportEquipDescr>
<supportEquipDescr id="seq-0002">
<name>Extractor, Right-handed, Puller</name>
<identNumber><manufacturerCode>K0378</manufacturerCode>
<partAndSerialNumber><partNumber>JJ123456</partNumber>
</partAndSerialNumber></identNumber>
<reqQuantity unitOfMeasure="EA">1</reqQuantity>
</supportEquipDescr>
</supportEquipDescrGroup>
</reqSupportEquips>
```

### 2.5.1 Support equipment description

**Description:** The element <supportEquipDescr> contains the information on each item of support equipment.

**Markup element:** <supportEquipDescr> (C)

ICN- S3627-S1000D0532-0014-01

*Fig 12 Element <supportEquipDescr>*

**Attributes:**

- `applicRefId` (O), the applicability information. Refer to Chap 3.9.5.3.
- `id` (O), the identifier of the <`supportEquipDescr`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <`name`> (O). Refer to Para 2.5.1.1.1.
- <`shortName`> (O). Refer to Para 2.5.1.1.2.
- The identification by one or more of the elements <`catalogSeqNumberRef`> <`natoStockNumber`>, <`identNumber`> and <`toolRef`>. Refer to Para 2.5.1.1.3.
- <`reqQuantity`> (C). Refer to Para 2.5.1.1.12.
- <`remarks`> (O). Refer to Para 2.5.1.1.13.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of the attribute `id`

**Markup example:**

```
<supportEquipDescr id="seq-0001">
<name>Specialist toolset</name>
<identNumber>
```

```
<manufacturerCode>KZ666</manufacturerCode>
<partAndSerialNumber>
<partNumber>BSK-TLST-001</partNumber>
</partAndSerialNumber>
</identNumber>
<reqQuantity unitOfMeasure="EA">1</reqQuantity>
</supportEquipDescr>
```

*2.5.1.1.1 Name of the support equipment element*

The element <name> contains the name of the support equipment. If the technical repository is used in the authoring process, the name of the support equipment is optional as it will be populated during the publication process. Refer to Chap 3.9.5.2.1.10.

*2.5.1.1.2 Shortname*

**Description:** The element <shortName> contains an abbreviated alternate name of the support equipment part designation corresponding to the element <name>. This short form for the name of the part designation is meant to be presented in the narrative of the data module to make the reading easier.

**Markup element:** <shortName> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<name>Specialist toolset</name>
```

*2.5.1.1.3 Identification*

One or more of the following elements can be used to identify the support equipment:

– <catalogSeqNumberRef> (O), the CSN. Refer to Para 2.5.1.1.4.
– <natoStockNumber> (O), the North Atlantic Treaty Organisation (NATO) stock number. Refer to Para 2.5.1.1.5.
– <identNumber> (O), the identification number. Refer to Para 2.5.1.1.6.
– <toolRef> (O), the tool reference. Refer to Para 2.5.1.1.9.

ICN- S3627-S1000D0533-0014-01

*Fig 13 Identification elements*

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– use of identification

*2.5.1.1.4 Catalog sequence number - CSN*

**Description:** The element <`catalogSeqNumberRef`> contains the link to the associated parts data module.

The CSN reference using only attribute `catalogSeqNumberValue` is the preferred method. The CSN can also be referenced by the use of both attribute `catalogSeqNumberValue` and attribute `itemSeqNumberValue`.

**Note**

The use of attribute `catalogSeqNumberValue` only, gives a generic reference to an item and no change is needed when a new specific part instance is added to the CSN in the IPD.

The CSN (attribute `catalogSeqNumberValue`) must consist of a 13 thru 16 character string, eg value "`11223301A002A`".

The CSN must be populated with all the 13 thru 16 characters. If there is no character in a position this position must be represented by a space. Eg value "`11223301 002A`".

The Item Sequence Number, ISN, (attribute `itemSeqNumberValue`) must consist of three characters, eg value "`01A`". All three positions must to be filled in.

**Note**

The CSN is 13 thru 16 characters depending on the project data module code rules. Refer to Chap 3.9.5.2.7 for details.

For details on CSN and ISN, refer to Chap 3.9.5.2.7.

**Markup element:** <`catalogSeqNumberRef`> (O)

**Attributes:**

- `id` (O), the identifier of the <`catalogSeqNumberRef`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `catalogSeqNumberValue` (C)
- `itemSeqNumberValue` (O), the Item Sequence Number, ISN, is used to specify a specific part instance of a CSN. For details on ISN, refer to Chap 3.9.5.2.7.
- `initialProvisioningProjectValue` (O), the Initial Provisioning project Number, Initial Provisioning project Number (IPPN) must be populated when the CSN belongs to a non-chapterized IPD. The IPPN must consist of nine characters comprising the five characters for the CAGE code and the four characters for the IPPN. Eg value "`F611799AA`". Used for non-chapterized IPD only.
- `responsiblePartnerCompanyCode` (O), the Responsible Partner Company, Responsible Partner Company (RPC), code can be filled in when the CSN belongs to a non-chapterized IPD. This is used to manage the corresponding IPD data module code from which the CSN belongs to, as this data module code is built with the RPC code, Refer to Chap 5.3.1.3. Used for non-chapterized IPD only.

  **Note**

  The attribute `responsiblePartnerCompanyCode` is optional for non-chapterized CSN reference, as it also can be deduced from the IPPN CAGE code (the first five digits of attribute `initialProvisioningprojectValue`).

- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.
- `xlink:href` (O), XLink attribute used to specify remote resource. Refer to Chap 7.7.4.
- `xlink:title` (O), XLink attribute used to used to describe the meaning of a link or resource in a human-readable fashion. Refer to Chap 7.7.4.
- `xlink:show` (O), XLink attribute used to used to describe how the reference will show. Refer to Chap 7.7.4. This attribute can have the following values:
  - "`new`", opens a new window to display the information
  - "`replace`", replaces the current window with the displayed information
  - "`embed`", embeds the information inline
  - "`other`", defined by user
  - "`none`", does not display the information

– xlink:acutate (O), XLink attribute used to used to describe if the data will be displayed automatically or on click. Refer to Chap 7.7.4. This attribute can have the following values:
  - "onLoad", displays the information when the page loads
  - "onRequest", displays the information on user click

**Child elements:**

– <refs> (O), to establish a reference to a document containing additional parts data related to the equipment concerned, ie a data module or publication module or some non-S1000D publication. Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

– None identified

**Markup example:**

```
<catalogSeqNumberRef catalogSeqNumberValue="D00000000A010"
itemSeqNumberValue="00A">...</catalogSeqNumberRef>
```

*2.5.1.1.5 NATO stock number - NSN*

**Description:** The element <natoStockNumber> contains the NATO Stock Number (NSN) of the support equipment. Optionally, the complete NSN can be broken into its constituent parts by using its attributes.

The NATO stock number reference is normally followed by an identification number (manufacturer code and part number).

The NSN (contained in <natoStockNumber>) consists of a 13 character string, eg value "4920991234567" with all positions filled in without any spaces.

**Markup element:** <natoStockNumber> (O)

**Attributes:**

– id (O), the identifier of the <natoStockNumber> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– natoSupplyClass (O), the first part of the NSN
– natoCodificationBureau (O), the second part of the NSN
– natoItemIdentNumberCore(O), the third part of NSN
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

The NSN parts (attribute natoSupplyClass, attribute natoCodificationBureau and attribute natoItemIdentNumberCore) is built up of four, two and seven characters respectively. Eg value "4290" value "99" and value "1234567" respectively.

**Child elements:**

– <fullNatoStockNumber> (O), this element contains all three of the individual elements that make up the complete NSN
– <refs> (O), to establish a reference to a document containing additional parts data related to the equipment concerned, ie a data module or publication module or some non-S1000D publication. Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– population of the element <natoStockNumber>

**Markup example:**

```
<natoStockNumber natoCodificationBureau="99"
natoItemIdentNumberCore="123456" natoSupplyClass="4920"/>
```

*2.5.1.1.6 Identification number*

**Description:** The element <identNumber> contains the manufacturer's identification information.

**Markup element:** <identNumber> (O)

ICN- S3627-S1000D0534-0014-01

*Fig 14 Element <identNumber>*

**Attributes:**

– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

**Child elements:**

– <manufacturerCode> (C). Refer to Para 2.5.1.1.7.
– <partAndSerialNumber> (O). Refer to Para 2.5.1.1.8.
– <refs> (O), to establish a reference to a document containing additional parts data related to the equipment concerned, ie a data module or publication module or some non-S1000D publication. Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

– None identified

**Markup example:**

```
<identNumber>
<manufacturerCode>KZ666</manufacturerCode>
<partAndSerialNumber>
<partNumber>BSK-TLST-001</partNumber>
</partAndSerialNumber>
</identNumber>
```

2.5.1.1.7 *Manufacturer code*

**Description:** The element <manufacturerCode> contains the manufacturer's code.

**Markup element:** <manufacturerCode> (C)

**Attributes:**

- id (O), the identifier of the <manufacturerCode> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

```
<manufacturerCode>KZ666</manufacturerCode>
```

2.5.1.1.8 *Part and serial number*

**Description:** The element <partAndSerialNumber> contains parts and serial numbers.

**Markup element:** <partAndSerialNumber> (O)

**Attributes:**

- None

**Child elements:**

- <partNumber> (M), the part number
- <serialNumber> (O), the listing of a single serial number or a range. Refer to Para 2.5.1.1.9.

**Business rules decisions:**

- None identified

**Markup example:**

```
<partAndSerialNumber>
<partNumber>BSK-TLST-001</partNumber>
</partAndSerialNumber>
```

2.5.1.1.9 *Part number*

**Description:** The element <partNumber> contains the part number.

**Markup element:** <partNumber> (C)

**Attributes:**

- id (O), the identifier of the <partNumber> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

– `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<identNumber>
<manufacturerCode>KZ666</manufacturerCode>
<partAndSerialNumber>
<partNumber>BSK-TLST-001</partNumber>
</partAndSerialNumber>
</identNumber>
```

*2.5.1.1.10 Serial number*

**Description:** The element <`serialNumber`> contains the listing of a single serial number or a range.

**Markup element:** <`serialNumber`> (O)

**Attributes:**

– `serialNumberForm` (C), the is used to specify if the serial number is a single value or a range of values. This attribute can have the following values:
  - "`single`", specifies a single value
  - "`range`", specifies a range of values
– `serialNumberValue` (C), the single value or the range of values. A tilde [~] is used to separate the two values. For example, LKJ123~LKJ777.

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<identNumber>
<manufacturerCode>KZ666</manufacturerCode>
<partAndSerialNumber>
<partNumber>BSK-TLST-001</partNumber>
<serialNumber serialNumberValue="LKJ123~LKJ777"
serialNumberForm="range"/>
</partAndSerialNumber>
</identNumber>
```

*2.5.1.1.11 Tool reference*

**Description:** The element <`toolRef`> contains the reference to a tool, for those projects which manage a technical information repository.

**Markup element:** <`toolRef`> (O)

**Attributes:**

- id (O), the identifier of the <toolRef> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- toolNumber (O), the tool identifier in the tool repository, see Chap 3.9.5.2.11.9
- manufacturerCodeValue (O), the supplier code
- specific (O), the indicator if it is a standard or a specific tool. This attribute can have the following values:
  - "1" (D) - indicates it is a standard tool
  - "0" - all tools that are not specific to the Product, and that are not a "common tool" (standard hand tool), ie it comprises mainly test equipments such as voltmeter or signal generators, but also ladders, platforms, torque wrench with particular value range, etc.
- toolAltFlag (O) the indicator if the tool is an alternative of the previously described tool. This attribute can have the following values:
  - "0" (D) - indicates that it is not an alternate tool
  - "1" - indicates that it is an alternate tool
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <refs> (O), to provide a link to the "Tools" technical information repository data module. Refer to Chap 3.9.5.2.11.9.

  **Note**

  Refer to Chap 4.13.1 for more information on paragraph significant data elements and their relations with their associated technical information repository data modules.

**Business rules decisions:**

- None identified

**Markup example:**

```
<supportEquipDescr>
<toolRef toolNumber="T123"></toolRef>
<reqQuantity>2</reqQuantity>
</supportEquipDescr>
```

*2.5.1.1.12 Quantity*

**Description:** The element <reqQuantity> contains the quantity of the support equipment item.

For items of indeterminate quantity, "As required" must be entered as text in the element <reqQuantity> and no attribute unitOfMeasure value must be specified.

**Markup element:** <reqQuantity> (C)

**Attributes:**

- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

– `unitOfMeasure` (C), the unit of measure. When the unit of measure is just the number of pieces, EA (= each) must be used.

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<reqQuantity>2</reqQuantity>
```

*2.5.1.1.13 Remarks*

**Description:** The element <`remarks`> contains any additional information to support the identification or use of the support equipment. Refer to Chap 3.9.5.1.

## 2.6 Required supplies

**Description:** The element <`reqSupplies`> contains information to list any required supplies.

**Markup element:** <`reqSupplies`> (M)

A list of any consumables (such as oils, greases, locking wire), materials (gasket sheet, sheet metal) and expendables (such as O-rings, gaskets, tab washers) required to accomplish the Procedure contained in the data module. Supplies must be identified by a name of the supply, identification and a quantity as applicable. As an identification number, the CSN/ISN identifier given in S2000M is recommended in order to provide a direct link to the IPD at the relevant location.

The element <`reqSupplies`> contains the same elements and attributes as the element <`reqSupportEquips`> (refer to Para 2.5) with the following exception:

– The element <`supplyDescr`> contains the same subelements as the element <`supportEquipDescr`>, as described at Para 2.5.1, except that element <`toolRef`> is substituted with the element <`supplyRqmtRef`> as described in Para 2.6.1.

If there are no supplies required, then the element <`noSupplies`> must be used.

**Note**

The use of element <`noSupplies`> generates at presentation "None". At page-oriented presentation "None" is given in the Name column of the Consumables, materials and expendables table.

If there are supplies required, then the element <`supplyDescr`>, within the element <`supplyDescrGroup`>, must be used for each consumable, material and expendable.

The attribute `id` in element <`supplyDescr`> can be applied so that the supply can be cross-referenced from the Procedure.

ICN- S3627-S1000D0448-001-01

*Fig 15 Element <reqSupplies>*

Refer to Para 2.6.1 for details on element <supplyRqmtRef>.

**Business rules decisions:**

– None identified

**Markup example:**

```
<reqSupplies>
<supplyDescrGroup>
<supplyDescr id="suppliedBy-0054">
<name>Oil, Engine, Gas Turbine</name>
<identNumber><manufacturerCode>K0378</manufacturerCode>
<partAndSerialNumber><partNumber>OIL-HHGA</partNumber>
</partAndSerialNumber></identNumber>
<reqQuantity unitOfMeasure="L">2,0</reqQuantity>
</supplyDescr>
<supplyDescr id="suppliedBy-0302">
<name>Grease, Lubricating</name>
<identNumber><manufacturerCode>K0378</manufacturerCode>
<partAndSerialNumber><partNumber>GRL-6726</partNumber>
</partAndSerialNumber></identNumber>
<reqQuantity unitOfMeasure="L">0,5</reqQuantity>
</supplyDescr>
</supplyDescrGroup>
</reqSupplies>
```

## 2.6.1 Supply requirement reference

**Description**: The element <supplyRqmtRef> contains the reference to a consumable, material and expendable for projects which manage a technical information repository.

**Markup element:** <supplyRqmtRef> (C)

**Attributes:**

- id (O), the identifier of the <supplyRqmtRef> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- supplyRqmtNumber (C) identifies the consumable in the consumable requirement repository, Refer to Chap 3.9.5.2.11.8.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <refs> (O), to provide a link to the "Supplies, requirements" repository data module. Refer to Chap 3.9.5.2.11.8.

**Note**

Refer to Chap 4.13.1 for more information on paragraph significant data elements and their relations with their associated technical information repository data modules.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of the attribute id on the element <internalRef>
- use of identification

**Markup example:**

Simple example:

```
<supplyRqmtRef supplyRqmtNumber="sup-0002"></supplyRqmtRef>
```

The following example shows that two liter of oil and 0,5 liter of grease are required for this Procedure. Here a part number and manufacturer identify the supplies to be used:

```
<reqSupplies>
<supplyDescrGroup>
<supplyDescr id="suppliedBy-0054">
<name>Oil, Engine, Gas Turbine</name>
<identNumber><manufacturerCode>K0378</manufacturerCode>
<partAndSerialNumber><partNumber>OIL-HHGA</partNumber>
</partAndSerialNumber></identNumber>
<reqQuantity unitOfMeasure="L">2,0</reqQuantity>
</supplyDescr>
<supplyDescr id="suppliedBy-0302">
<name>Grease, Lubricating</name>
<identNumber><manufacturerCode>K0378</manufacturerCode>
<partAndSerialNumber><partNumber>GRL-6726</partNumber>
</partAndSerialNumber></identNumber>
<reqQuantity unitOfMeasure="L">0,5</reqQuantity>
</supplyDescr>
</supplyDescrGroup>
</reqSupplies>
```

## 2.7 Required spares

**Description:** This element <reqSpares> must contain information to list any required spares.

**Markup element:** <reqSpares> (M)

A list of any spares required to accomplish the Procedure contained in the data module. Spares must be identified by a name of the spare, identification and a quantity as applicable. As an identification number, the CSN/ISN identifier given in S2000M is recommended in order to provide a direct link to the IPD at the relevant location.

The element <reqSpares> contains the same elements and attributes as the element <reqSupportEquips> (refer to Para 2.5) with the following exception:

– The element <sparesDescr> contains the same subelements as the element <supportEquipDescr>, as described at Para 2.5.1, except that element <toolRef> is substituted with the element <functionalItemRef> as described in Para 2.7.1.

If there are no spares requirements, then the element <noSpares> must be used.

**Note**

The use of element <noSpares> generates at presentation "None". At page-oriented presentation "None" is given in the Name column of the Spares table.

If there are spares required, then the element <spareDescr>, within the element <spareDescrGroup>, must be used for each spare.

The attribute id in element <spareDescr> can be applied so that the spares can be cross-referenced from the Procedure.

ICN-S3627-S1000D0449-001-01

*Fig 16 Element <reqSpares>*

Refer to Para 2.7.1 for details on element <functionalItemRef>.

**Business rules decisions:**

– None identified

**Markup example:**

```
<reqSpares>
<spareDescrGroup>
<spareDescr id="spa-0987">
<name>Blade, LP Compressor</name>
<natoStockNumber natoSupplyClass="2840"
natoCodificationBureau="99" natoItemIdentNumberCore="1234524"/>
<catalogSeqNumberRef catalogSeqNumberValue="72321001A010A"
itemSeqNumberValue="00A"/>
<reqQuantity unitOfMeasure="EA">23</reqQuantity>
</spareDescr>
<spareDescr id="spa-0752">
<name>Retainer, Blade, LP Compressor</name>
<natoStockNumber natoSupplyClass="2840"
natoCodificationBureau="99" natoItemIdentNumberCore="1234584"/>
<catalogSeqNumberRef catalogSeqNumberValue="72321001A040A"
itemSeqNumberValue="00A"/>
<reqQuantity unitOfMeasure="EA">23</reqQuantity>
</spareDescr>
</spareDescrGroup>
</reqSpares>
```

### 2.7.1 Functional item reference

The element <functionalItemRef> is used for projects using functional item number, as introduced in Chap 3.9.5.1. Refer to Chap 3.9.5.1 for detail on population of element <functionalItemRef>.

## 2.8 Required safety

**Description:** The element <reqSafety> must contain information to list any safety requirements.

Any warnings, cautions and notes applicable to the Procedure and the Requirements after job completion in the data module must be listed here.

If there are no safety requirements, then the element <noSafety> must be used.

**Note**

The use of element <noSafety> generates at presentation "None". At page-oriented presentation "None" is given as a text paragraph under the caption Safety conditions.

**Markup element:** <reqSafety> (M)

ICN- S3627-S1000D0482-001-01

*Fig 17 Element <reqSafety>*

**Attributes:**

– None

**Child elements:**

- <noSafety> (O), the indicator of no required safety requirements as given in the description above
- <safetyRqmts> (O). Refer to Para 2.8.1.

**Business rules decisions:**

- None identified

**Markup example:**

The following example shows two warnings in the Safety conditions:

```
<reqSafety>
<safetyRqmts>
<warning>
<warningAndCautionPara>Sellinium-X is corrosive. Do not get it
on your skin.
Do not drink it. Use it in a well ventilated
area.</warningAndCautionPara>
</warning>
<warning>
<warningAndCautionPara>Make sure you read the standard reqSafety
conditions
that are given in <dmRef>
<dmRefIdent>
<dmCode assyCode="00" disassyCode="00" disassyCodeVariant="A"
infoCode="012"
infoCodeVariant="A" itemLocationCode="D" modelIdentCode="AE"
subSubSystemCode="0"
subSystemCode="0" systemCode="00"
systemDiffCode="A"/></dmRefIdent>
</dmRef>.</warningAndCautionPara>
</warning>
</safetyRqmts>
</reqSafety>
```

### 2.8.1 Safety requirements

**Description:** If there are any safety requirements, then the element <safetyRqmts> must be used. This element can be populated with the attribute warningRefs or the attribute cautionRefs, or the element <warning>, the element <caution>, or the element <note>, as described at Chap 3.9.3.

**Markup element:** <safetyRqmts> (O)

**Attributes:**

- id (O), the identifier of the <safetyRqmts> element. Refer to Chap 3.9.5.2.1.2.
- warningRefs (O), the warning reference to the warnings and cautions collection. Refer to Chap 3.9.3.
- cautionRefs (O), the caution reference to the warnings and cautions collection. Refer to Chap 3.9.3.

**Child elements:**

- <warning> (C), repeatable. Refer to Chap 3.9.3.
- <caution> (C), repeatable. Refer to Chap 3.9.3.
- <note> (C), repeatable. Refer to Chap 3.9.3.

**Business rules decisions:**

– None identified

**Markup example:**

```
<safetyRqmts>
<warning>
<warningAndCautionPara>Sellinium-X is corrosive. Do not get it
on your skin.
Do not drink it. Use it in a well ventilated
area.</warningAndCautionPara>
</warning>
<warning>
<warningAndCautionPara>Make sure you read the standard reqSafety
conditions
that are given in <dmRef>
<dmRefIdent>
<dmCode assyCode="00" disassyCode="00" disassyCodeVariant="A"
infoCode="012"

subSubSystemCode="0"
subSystemCode="0" systemCode="00"
systemDiffCode="A"/></dmRefIdent>
</dmRef>.</warningAndCautionPara>
</warning>
</safetyRqmts>
```

## 2.9 Requirements after job completion

**Description:** The element <closeRqmts> contains any actions that are required after the Procedure is complete.

**Markup element:** <closeRqmts> (M)

ICN-S3627-S1000D0535-001-01

*Fig 18 Element <closeRqmts>*

The element is mandatory in procedural data modules and optional in process data modules.

If there are no actions then the element <noConds> must be used.

If there are actions, then the element <reqCond>, element <reqCondDm>, element <reqCondCircuitBreaker> or element <reqCondTechPub> must be used to give the close-up requirement action in accordance with Para 2.2.

The requirements can reference data modules, publication modules, non-S1000D publications or contain no reference at all. It is recommended that details for close up be given by only referring to complete data modules. The use of element <reqCond> without a reference must be avoided. The requirements after job completion must be in the order that the requirements are satisfied.

**Attributes:**

- id (O), the identifier of the <closeRqmts> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

<recCondGroup> (M). Refer to Para 2.2.

**Business rules decisions:**

- None identified

**Markup example:**

```
<closeRqmts>
<reqCondGroup>
<reqCondNoRef>
<reqCond>Replace the tire.</reqCond>
</reqCondNoRef>
<reqCondDm>
<reqCond>Inflate the tire with air.</reqCond>
<dmRef xlink:type="simple" xlink:actuate="onRequest"
xlink:show="replace" xlink:href="URN:S1000D:DMC-S1000(DBIKE)-

infoCode="215" infoCodeVariant="A" itemLocationCode="A"/>
</dmRefIdent>
</dmRef>
</reqCondDm>
</reqCondGroup>
</closeRqmts>
```

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use of production maintenance data**. The project or the organization must decide whether to use the production maintenance data, element <productionMaintData>, or not. Refer to Para 2.1.

**Use of the element <thresholdInterval>.** The project or the organization must decide whether to use element <thresholdInterval>or not. Refer to Para 2.1.1.

**Use of the element <zoneRef>.** The project or the organization must decide whether to use the element <zoneRef> element or not, and how to use it. Consideration for duplication and mismatch of data given in the maintenance planning information has to be taken. Refer to Para 2.1.2.

**Use of the element <accessPointRef>.** The project or the organization must decide whether to use the element <accessPointRef> or not, and how to use it. Consideration for duplication and mismatch of data given in the maintenance planning information has to be taken. Refer to Para 2.1.3.

**Use of the attribute lsarData.** The project or organization must decide whether to use the attribute lsarData or not. Refer to Para 2.1.2 and Para 2.1.3.

**Use of the element <workArea>.** The project or the organization must decide whether to use the element <workArea> element or not, and how to use it. If used, projects will decide which data module types will use it. Refer to Para 2.1.4.

**Use of the element <taskDuration>.** The project or the organization must decide whether to use the <taskDuration> element or not, and how to use them. Consideration for duplication and mismatch of data given in the maintenance planning information has to be taken. Refer to Para 2.1.5.

**Use of list of the element <reqCondCircuitBreaker>.** The projects or the organization must decide if a circuit breaker list is to be considered as part of preliminary conditions and thus the use of the element (refer to Para 2.2.4) or if the circuit breaker settings are part of the steps. In this later case the element <circuitBreakerDescrGroup> in steps content can be used (refer to Chap 3.9.5.2.3).

**Use of element <reqPersons>**. The project or the organization must decide how to use the element. Eg use of either the element <reqPersons> or the element <person> or by use of a mix of the two elements. Refer to Para 2.3.

**Values for the attribute personCategoryValue.** The project or the organization must define a list of categories, eg Electrician, Propulsion engineer, Maintainer. Refer to Para 2.3.1.1.1.

**Trade codes.** The project or the organization must define a list of trades/trade codes. Refer to Para 2.3.1.1.3.

**Use of the element <reqTechInfo>.** The project or the organization must decide whether to use the element <reqTechInfo> or not. Refer to Para 2.4.

**How to use the element <reqTechInfo>.** The project or the organization must decide how to use the element <reqTechInfo>.

- Allowed values of attribute reqTechInfoCategory
- Which categories to be presented in the table Required technical information and which to be presented in Reference table (element <refs> in the element <content>. Refer to Chap 3.9.5.2.1.2 and Para 2.4.

**Listing of common and standard tools.** The project or the organization must decide what types of common and standard tools or toolkits to be identified and listed. Refer to Para 2.5.

**Use of the attribute id on the element <supportEquipDescr>**. The project or the organization must decide to make use of cross-references from the Procedure to the support equipment listed in preliminary requirements. The attribute id on element <supportEquipDescr> respectively, is used to establish the link between the two and

will guarantee consistent use identification throughout the Procedure. The use of cross-references is encouraged. Refer to Para 2.5.1.

**Use of identification**. The project or the organization must decide which elements to use for identification and how to populate these elements. Refer to Para 2.5.1.1.3.

**Population of NSN**. projects must decide on how to populate the element <natoStockNumber>. Refer to Para 2.5.1.1.5.

**Use of the attribute id on element <supplyDescr>.** The project or the organization must decide to make use of the element <supplyDescr>**.** Refer to Para2.6.

**Use of the attribute id on the element <internalRef>**. The project or the organization must decide to make use of cross-references from the Procedure to the support equipment listed in preliminary requirements. The attribute internalRefId of element <internalRef> and the attribute id on element <spareDescr > respectively, are used to establish the link between the two and will guarantee consistent use identification throughout the Procedure. The use of cross-references is encouraged. Refer to Para 2.6.1.

**Use of attribute responsiblePartnerCompanyCode**. The project or the organization must decide on the use of the attribute responsiblePartnerCompanyCode for non-chapterized IPD. Refer to Para 2.7.

# 4 Examples

## 4.1 Preliminary requirements

The following markup example gives the preliminary requirements for S1000DBIKE-AAA-D00-00-00-00AA-258A-A. This data module is presented in full in Chap 6.2.3.3.

```
<preliminaryRqmts>
<reqCondGroup>
<reqCondNoRef>
<reqCond>The bicycle is outdoors</reqCond>
</reqCondNoRef>
</reqCondGroup>
<reqPersons applicRefId="apMK9">
<person man="A">
<personCategory personCategoryCode="Chemical technician"/>
<personSkill skillLevelCode="sk02"/>
<trade>Bike cleaner</trade>
<estimatedTime unitOfMeasure="h">1,0</estimatedTime>
</person>
</reqPersons>
<reqPersons applicRefId="apMK1">

# 1 General

The paragraph elements are used to capture text. Several different paragraph models are available depending upon which data module type is being used and where the paragraph is used. The available subelements for each paragraph model are tailored dependent upon its use. For example: including a list within a paragraph is desirable when used in a procedural

step (in element <para>), but is not desirable when used in an applicability statement (in element <simplePara>). The different models are detailed within this paragraph. Usage of individual content elements is detailed in Para 2.

The rules for the presentation of the text, including tables and figures are given in Chap 6.

Care must be taken when authoring text when placing spaces around embedded elements within the element <para> to ensure that spaces are inserted correctly so that the displayed/printed output is spaced correctly. Example:

```
<para>This is<emphasis
emphasisType="em01">bold</emphasis>text.</para>
```

Will yield

"This is**bold**text."

When the following is intended:

```
<para>This is <emphasis emphasisType="em01">bold</emphasis>
text.</para>
```

Will yield

"This is **bold** text."

## 1.1 Paragraph models

The paragraph model holds five types of paragraph elements:

- <para>
- <warningAndCautionPara>. Refer to Chap 3.9.3 for details.
- <attentionListItemPara>. Refer to Chap 3.9.3 for details.
- <notePara>. Refer to Chap 3.9.3.
- <simplePara>. Refer to Para 2.2 for details.

The element <para> consists of two groups of elements:

- textElementGroup which is detailed in this chapter. Refer to Para 1.1.1and Para 2.
- listElementGroup. Refer to Para 1.1.2 and Chap 3.9.5.2.1.3 for details.

ICN-S3627-S1000D0536-001-01

*Fig 1 Element <para>*

### 1.1.1 The textElementGroup

The content of the `textElementGroup` vary depending on data module type but the name of the group is still the same for all data module types. The full (maximum) content of the `textElementGroup` is shown in Fig 2.

**Note**

The `textElementGroup` is used in several other text elements, eg in the element <`action`> in the fault isolation schema. The content of the `textElementGroup` is always the same within the same data module type wherever it appears.

ICN-S3627-S1000D0537-001-01

*Fig 2 The `textElementGroup`*

The content of the five different paragraph types are detailed in Fig 3. The figure provides the element name, which data module types the element is available in and which subelements are available in that context.

**Note**

Even if this chapter is aimed for the element <`para`> or rather the `textElementGroup` and the element <`simplePara`>, the figure includes all five paragraph types to give a complete overview of the where the subelements are used.

**Note**

The `attentionText` group is detailed in Chap 3.9.3.

| Element [group] | Data module type in which the element occurs | Available subelements (grey indicates available) | | | | | | | | | | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | functionalItemRef | circuitBreakerRef | controlIndicatorRef | inlineSignificantData | quantity | zoneRef | accessPointRef | identNumber | internalRef | indexFlag | changeInline | emphasis | symbol | subScript | superScript | dmRef | pmRef | externalPubRef | footnote | footnoteRef | acronym | acronymTerm | captionGroup | caption | verbatimText |
| <para> [textElementGroup] | descript<br>learning<br>scormContent | | | | | | | | | | | | | | | | | | | | | | | | | |
| <para> [textElementGroup] | crew | | | | | | | | | | | | | | | | | | | | | | | | | |
| <para> [textElementGroup] | checkList | | | | | | | | | | | | | | | | | | | | | | | | | |
| <para> [textElementGroup] | fault | | | | | | | | | | | | | | | | | | | | | | | | | |
| <para> [textElementGroup] | proced<br>process | | | | | | | | | | | | | | | | | | | | | | | | | |
| <para> [textElementGroup] | ipd<br>schedul | | | | | | | | | | | | | | | | | | | | | | | | | |
| <warningAndCautionPara> [attentionText] | checkList<br>crew<br>descript<br>learning | | | | | | | | | | | | | | | | | | | | | | | | | |
| <warningAndCautionPara> [attentionText] | fault<br>proced<br>process<br>schedul | | | | | | | | | | | | | | | | | | | | | | | | | |
| <attentionListItemPara> [attentionText] | checkList<br>crew<br>descript<br>learning | | | | | | | | | | | | | | | | | | | | | | | | | |
| <attentionListItemPara> [attentionText] | fault<br>proced<br>process<br>schedul | | | | | | | | | | | | | | | | | | | | | | | | | |
| <notePara> [attentionText] | checkList<br>crew<br>descript<br>learning | | | | | | | | | | | | | | | | | | | | | | | | | |
| <notePara> [attentionText] | fault<br>proced<br>process<br>techrep | | | | | | | | | | | | | | | | | | | | | | | | | |
| <notePara> [attentionText] | schedul | | | | | | | | | | | | | | | | | | | | | | | | | |
| <simplePara> | all | | | | | | | | | | | | | | | | | | | | | | | | | |

ICN-S3627-S1000D0538-001-01

*Fig 3 Paragraph models and available subelements*

### 1.1.2 The listElementGroup

The content of the `listElementGroup` is:

- sequential (ordered) lists
- random lists
- definition lists

For details of authoring lists, refer Chap 3.9.5.2.1.3.

# 2 Text elements

## 2.1 Available subelements in the textElementGroup

The complete list of possible subelements in the textElementGroup is:

- paragraph meaningful data, including:
  - elements with dedicated associated technical repository:
    - <functionalItemRef> - functional item number. Refer to Chap 3.9.5.1.
    - <circuitBreakerRef> - circuit breaker. Refer to Para 2.1.1.
    - <controlIndicatorRef> - control or indicator. Refer to Para 2.1.2.
    - <zoneRef> - zone. Refer to Para 2.1.5.
    - <acceassPointRef> - access point. Refer to Para 2.1.6.
  - elements without dedicated technical repository:
    - <inlineSignificantData> - paragraph significant data. Refer to Para 2.1.3.
    - <quantity> - quantity data. Refer to Para 2.1.4.
- <identNumber> - identification number (part/serial number and associated manufacturer code). Refer to Chap 3.9.5.2.1.9.
- <indexFlag> - indexes. Refer to Para 2.1.7.
- <changeInline> - inline change marking. Refer to Chap 3.9.5.2.1.1.
- <emphasis> - emphasis. Refer to Para 2.1.8.
- <symbol> - symbols. Refer to Para 2.1.9.
- <subScript> - subscript. Refer to Para 2.1.10.
- <superScript> superscript. Refer to Para 2.1.11.
- references, refer to Chap 3.9.5.2.1.2, including:
  - <internalRef> - internal references
  - <dmRef> - data module references
  - <pmRef> - publication module references
  - <externalPubRef> - external publication references
- <footnote> - footnotes. Refer to Para 2.1.12.
- <footnoteRef> - footnote references. Refer to Para 2.1.13.
- <acronym> and <acronymTerm> - acronyms, refer to Para 2.1.14.
- <captionGroup> and <caption> - captions. Refer to Chap 3.9.5.2.1.4.
- <verbatim> - verbatim. Refer to Para 2.1.15.

### 2.1.1 Circuit breaker

**Description:** The element <circuitBreakerRef> contains the details about the circuit breaker eg, number, circuit breaker action and circuit breaker type.

**Markup element:** <circuitBreakerRef>

**Attributes:**

- id (O), the identifier of the circuit breaker reference element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1
- circuitBreakerNumber (M), the circuit breaker identifier (number).
- circuitBreakerType (O), the circuit breaker type. This attribute can have one of the following values:
  - "eltro" - electronic circuit breaker
  - "elmec" - electromechanical circuit breaker
  - "clip" - dummy circuit breaker for provisioning use (clipped circuit breaker)

- circuitBreakerAction (O), indicates the action to perform on the circuit breaker. This attribute can have one of the following values:
  - "open" - the action "to open"
  - "close" - the action "to close"
  - "verify-open" - the check of the condition: "is open"
  - "verify-close" - the check of the condition: "is closed"
- checkSum (O), the entered data which allows potential integrity verification
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11
- securityClassification (O), commercialClassification (O) and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6

**Child elements:**

- <name> (O), the name of the circuit breaker. Refer to Para 2.1.16.
- <refs> (O), references providing a link to the circuit breaker. Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use of the attribute circuitBreakerAction, and if used, how to populate the attribute.
- Use of the attribute checkSum, and if used, how to populate the attribute.

**Markup example:**

```
<circuitBreakerRef circuitBreakerNumber="809-VM"
circuitBreakerAction="open" checkSum="f9f62226"/>
```

### 2.1.2 Controls and indicators

**Description:** The element <controlIndicatorRef> contains the number and name of the controls or indicators and the reference to the control and indicator repository data module.

**Markup element:** <controlIndicatorRef> (O)

**Attributes:**

- id (O), the identifier of the controls and indicators element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1
- controlIndicatorNumber (O), the control or indicator number identified in the technical repository data module. Refer to Chap 3.9.5.2.11.11 and Chap 4.13.2.
- securityClassification (O), commercialClassification (O) and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6

**Child elements:**

- <name> (O), the name of the control or indicator. Refer to Para 2.1.16.
- <refs> (O), provides a link to the control and indicator repository data module. Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the attribute `controlIndicatorNumber`

**Markup example:**

```
<controlIndicatorRef controlIndicatorNumber="ci-0001">
...
</controlIndicatorRef>
```

### 2.1.3 Paragraph significant data

**Description:** The element <`inlineSignificantData`> contains a significant meaning, such as a lubricant or manufacturer code.

**Markup element:** <`inlineSignificantData`> (O)

**Attributes:**

– `significantParaDataType` (M), the meaning of the data. This attribute can have the following values:
  - "`psd01`" - "`psd99`". Refer to Chap 3.9.6.1.

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Types of data to markup.

**Markup example:**

The following markup example illustrates the use of <`inlineSignificantData`>:

```
<para>Use lubricant
(<inlineSignificantData
significantParaDataType="psd03">1X234</inlineSignificantData>)
on threads...
</para>
```

The display of this markup can be as follows:

"Use lubricant (1X234) on threads..."

### 2.1.4 Quantity data

**Description:** The element <`quantity`> provides the capability to identify a portion of a paragraph that corresponds to a numeric value with a special meaning, such as a torque value. The exact meaning of the quantity data can be specified using a set of predefined S1000D values, or extended to support specific project needs.

The quantity data provides the ability to define numerical values to a very precise level. Use of the quantity group structure within quantity data provides the following capabilities:

– Specify a decimal value that does not contain display format information, ie adheres to the W3C XML standard for decimal numbers
– Specify a unit of measure that applies to the value
– Group a value and a tolerance together
– Specify units of measure to the value/tolerance group or to value and tolerance individually
– Group multiple values and tolerances together, units can be apply to the group or individual values

**Markup element:** <quantity> (O)

ICN-S3627-S1000D0539-001-01

*Fig 4 Element <quantity>*

**Attributes:**

– quantityType (O), the type of quantity, eg length, time. This attribute can have the following values:
  - "qty01" - "qty99". Refer to Chap 3.9.6.1.

**Child elements:**

– <quantityGroup> (O). Refer to Para 2.1.4.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the quantity data markup and to what extent
– Determine which types of data to mark up and in what contexts

**Markup example:**

Example 1: Simple quantity with the use of the attribute type:

```
<para>Maximum torque not to exceed
<quantity quantityType="qty05">8 Nm</quantity>.
</para>
```

The display of this markup can be as follows:

"Maximum torque not to exceed 8 Nm."

Example 2: Quantity with the use of the quantity group:

```
<para>Maximum torque not to exceed
<quantity quantityType="qty05">
<quantityGroup quantityGroupType="nominal">
<quantityValue quantityUnitOfMeasure="N.m">8</quantityValue>
</quantityGroup>
</quantity>
.</para>
```

The display of this markup can be as follows:

"Maximum torque not to exceed 8 Nm."

2.1.4.1 Quantity group

**Description:** The element <quantityGroup> contains a group of values and tolerances and/or multiple values in the case where multiple units of measure are used (eg 2 h 30 min).

**Markup element:** <quantityGroup> (O)

**Attributes:**

- quantityGroupType (O). This attribute can have the following values:
  - "nominal" (D) - a single value
  - "minimum" - a "from" (beginning of a range) or "minimum" value
  - "maximum" - a "to" (end of a range) or "maximum" value
- quantityUnitOfMeasure (O), the unit of measure. Refer to Chap 3.9.6.2 for an enumerated list of standard quantity unit of measures. These can be extended using the standard BREX file mechanism. The value within the attribute quantityUnitOfMeasure is a code specifying the exact unit of measure. A quantityUnitOfMeasure at this level indicates that the quantityUnitOfMeasure applies to the entire group, possibly including several values and/or tolerances. The implication is that by default the unit of measure will be displayed once after the value/tolerance; eg "0.250 +0.003 -0.000 in.", but other formats can be applied by stylesheets.

  Refer to Chap 3.9.1 for rules for presentation of unit of measurements and fractions.

About unit of measurements

- attribute quantityUnitOfMeasure on nothing indicates no unit of measure is to be displayed
- attribute quantityUnitOfMeasure on element <quantityValue> and on element <quantityTolerance> within same element <quantityGroup> applies to each value or tolerance independent of the others
- attribute quantityUnitOfMeasure on two elements <quantityValue> within same element <quantityGroup> applies to each value independent of the other or others

  **Note**

  In cases where the attribute quantityUnitOfMeasure is specified at both the element <quantityGroup> level and at the element <quantityValue> or element <quantityTolerance> level, the quantityUnitOfMeasure value from the lower level (element <quantityValue> or element <quantityTolerance>) must take precedence over the attribute quantityUnitOfMeasure value from the element <quantityGroup>.

**Child elements:**

- <quantityValue> (M), the value and an optional unit of measure. Refer to Para 2.1.4.1.1
- <quantityTolerance> (O), the tolerance value. Refer to Para 2.1.4.1.2

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use of value and tolerance decomposition and to what level of the markup that the unit of measure is to be applied
- Which unit of measure types to allow

**Markup example:**

Example 1: Quantity group and is a simple quantity with value and unit of measure:

```
<para>The windshield assembly weighs approximately
<quantity>
<quantityGroup quantityGroupType="nominal">
<quantityValue quantityUnitOfMeasure="kg">40</quantityValue>
</quantityGroup>
</quantity>
and requires two persons ...
</para>
```

The display of this markup can be as follows:

"The windshield assembly weighs approximately 40 kg and requires two persons ..."

Example 2: Quantity where value and tolerance have the same unit of measure:

```
<para>If hole tolerance of
<quantity>
<quantityGroup quantityGroupType="nominal"
quantityUnitOfMeasure="mm">
<quantityValue>0.700</quantityValue>
<quantityTolerance
quantityToleranceType="plus">0.010</quantityTolerance>
<quantityTolerance
quantityToleranceType="minus">0.000</quantityTolerance>
</quantityGroup>
</quantity>
has been exceeded ...
</para>
```

The display of this markup can be as follows:

"If hole tolerance of 0,700 +0,010 -0,000 mm has been exceeded ..."

Example 3: Quantity with minimum/maximum values:

```
<para>Tighten fasteners
<quantity quantityType="qty05">
<quantityGroup quantityGroupType="minimum">
<quantityValue quantityUnitOfMeasure="N.m">18.0</quantityValue>
</quantityGroup>
<quantityGroup quantityGroupType="maximum">
<quantityValue quantityUnitOfMeasure="N.m">22.0</quantityValue>
</quantityGroup>
</quantity>
using torque wrench ...
</para>
```

The display of this markup can be as follows:

"Tighten fasteners from 18,0 Nm to 22,0 Nm using torque wrench ..."

*2.1.4.1.1 Value*

**Description:** The element <`quantityValue`> contains a decimal value and an optional unit of measure. The value must conform to the W3C XML standard for decimal values which

requires use a period [.] for the separator between the integral part and the fractional part, and no thousands separator. The display format is not specified in the XML code but, must conform to program or country requirements at presentation (Refer to Chap 3.9.1 for rules on presentation).

**Markup element:** <quantityValue> (M)

**Attributes:**

– quantityUnitOfMeasure (O), specifies the unit of measure. Refer to Para 2.1.4.1.

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of value and tolerance decomposition and to what level of the markup that the unit of measure is to be applied
– Which unit of measure types to allow

**Markup example:**

The following markup example illustrates the use of quantity group and is a simple quantity with value and unit of measure:

```
<quantityValue quantityUnitOfMeasure="kg">40</quantityValue>
```

*2.1.4.1.2 Tolerance*

**Description:** The element <quantityTolerance> contains a decimal tolerance value, the type of tolerance, and an optional unit of measure. The tolerance value must conform to the W3C XML standard for decimal values which reuires use a period [.] for the separator between the integralpart and the fractionalpart, and no thousands separator. The display format is not specified in the XML code, but must conform to program or country requirements at presentation (refer to Chap 3.9.1 for rules on presentation).

**Markup element:** <quantityTolerance> (O)

**Attributes:**

– quantityToleranceType (O), the type of tolerance with allowable values. This attribute can have the following values:
  - "plus" - the tolerance must be within the range of the value specified
  - "minus" - the tolerance must be within the range of the value specified
  - "plusorminus" - the tolerance must be within range of the value specified
– quantityUnitOfMeasure (O), specifies the unit of measure. Refer to Para 2.1.4.1.

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of value and tolerance decomposition and to what level of the markup that the unit of measure is to be applied
– Which unit of measure types to allow

**Markup example:**

Example 1: Quantity with type, value, tolerance, and unit of measure:

```
<para>Holding nut, torque bolt to
<quantity quantityType="qty05">
<quantityGroup quantityGroupType="nominal" unitOfMeasure="N.m">
<quantityValue>20</quantityValue>
<quantityTolerance
quantityToleranceType="plusorminus">2</quantityTolerance>
</quantityGroup>
</quantity>
.
</para>
```

The display of this markup can be as follows:

"Holding nut, torque bolt to 20 ±2 Nm."

Example 2: Quantity with multiple value groups and value and tolerance with different units:

```
<para>Chamfer both sides of rib
<quantity>
<quantityGroup quantityGroupType="nominal">
<quantityValue>0.153</quantityValue>
<quantityTolerance
quantityToleranceType="plusorminus">0.005</quantityTolerance>
</quantityGroup>
x
<quantityGroup quantityGroupType="nominal">
<quantityValue quantityUnitOfMeasure="dega">45</quantityValue>
<quantityTolerance quantityToleranceType="plusorminus"
quantityUnitOfMeasure="mina">30
</quantityTolerance>
</quantityGroup>
</quantity>
.
</para>
```

The display of this markup formatted for Système International d'Unites (SI) can be as follows:

"Chamfer both sides of rib 0,153 ±0,005 × 45° ±30´."

The display of this markup formatted for imperial can be as follows:

"Chamfer both sides of rib 0.153 ±0.005 × 45° ±30´."

Example 3: Quantity with tolerance only:

```
<para>Make sure that spacing is within
<quantity>
<quantityGroup quantityGroupType="nominal">
<quantityTolerance
quantityToleranceType="plusorminus">0.030</quantityTolerance>
</quantityGroup>
</quantity>
on each side ...
</para>
```

The display of this markup formatted for SI can be as follows (comma separator):

"Make sure that spacing is within ±0,030 on each side ..."

The display of this markup formatted for imperial can be as follows (period separator):

"Make sure that spacing is within ±0.030 on each side ..."

### 2.1.5 Zone

**Description:** The element <zoneRef> contains the zoning information (one or more), as described in Chap 3.4. For the use of element <zoneRef> in connection with technical information repositories, refer to Chap 4.13.2.

This element is available in the product management data within the element <productionMaintData> of preliminary requirements (refer to Chap 3.9.5.2.1.9) and within the element <para> of descriptive data modules.

**Markup element:** <zoneRef> (O), repeatable

**Attributes:**

- id (O), the identifier of the zone element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O) and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1
- zoneNumber (O), the zone identifier
- lsarData (C), a mark to identify if the reference is derived from a Logistics Support Analysis Record (LSAR) or not. This attribute can have the following values:
  - "0" (D) - No, when not derived from an LSAR
  - "1" - Yes, when derived from an LSAR
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11
- securityClassification (O), commercialClassification (O) and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6

**Child elements:**

- <name> (O), the name of the zone. Refer to Para 2.1.16.
- <refs> (O). Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use of the element <zoneRef>

**Markup example:**

Example 1: A zone with a name, zone number and indicating the use of LSAR data:

```
<zoneRef lsarData="1" zoneNumber="500">
<name>Left wing</name>
</zoneRef>
```

Example 2: A zone with a zone identifier and a zone number:

```
<zoneRef id="zoneRef-210" zoneNumber="210"/>
```

### 2.1.6 Access point

**Description:** The element <accessPointRef> describe/identify any (one or more) access points like panels, doors, hatches. The identifier of the access point is given either through the attribute accessPointNumber or the element <name> element <refs>. For the use of

element <accessPointRef> in connection with technical information repositories, refer to Chap 4.13.2.

This element is available in the product management data within the element <productionMaintData> of preliminary requirements (refer to Chap 3.9.5.2.1.9) and within the element <para> of descriptive data modules.

**Markup element:** <accessPointRef> (O), repeatable

**Attributes:**

- id (O), the identifier of the access point element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O) and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1
- attribute accessPointNumber (O), the identifier of the access point
- attribute accessPointTypeValue (O), the access point type. This attribute can have the following values:
  - "accpnl01" - "accpnl99". Refer to Chap 3.9.6.1.
- lsarData (C), a mark to identify if the reference is derived from an LSAR or not. This attribute can have the following values:
  - "0" (D) - No, when not derived from an LSAR
  - "1" - Yes, when derived from an LSAR
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11
- securityClassification (O), commercialClassification (O) and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6

**Child elements:**

- <name> (O), the name of the zone. Refer to Para 2.1.16.
- <refs> (O). Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use of the element <accessPointRef>

**Markup example:**

Example 1: An access point with a name, access point number, and indicating the use of LSAR data:

```
<accessPointRef accessPointNumber="2514VU" lsarData="1">
<name>Panel A</name>
</accessPointRef>
```

**Markup example:**

Example 2: A n access point with an identifier and an access point number:

```
<accessPointRef id="accessRef-210" accessPointNumber="210"/>
```

### 2.1.7 Index

**Description:** The element <indexFlag> is used to contain the text of an item that is required to be included in an automatically generated index.

**Markup element:** <indexFlag> (O)

**Attributes:**

– indexLevelOne (O), indexLevelTwo (O), indexLevelThree (O), and indexLevelFour (O), which are used to indicate the four permissible levels of indexing

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Whether an index is required and to what level indexing is made

**Markup example:**

```
<indexFlag indexLevelOne="1">Bike tire</indexFlag>
```

### 2.1.8 Emphasis

**Description:** The element <emphasis> contains eg a word, an expressions or a sentence to be highlighted.

To highlight a word, an expression or a sentence, bold text is the preferred method. Alternatively, the use of color is permitted. Capital (uppercase) letters, italics or underlining are not permitted to highlight text, except for legacy data. Refer to Chap 3.9.1.

**Markup element:** <emphasis> (O)

**Attributes:**

– emphasisType (O), the type of emphasis such as bold and is set to one of the values given in Chap 3.9.6

**Child elements:**

– Includes the same set of child elements as the textElementGroup applicable for the actual data module type. Refer to Para 1.1.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of attribute emphasisType values

**Markup example:**

Example 1: A paragraph with a highlighted word which is intended by the author to be emphasized by making it appear in bold:

```
<para>This is some text which has the word <emphasis
emphasisType="em01">emphasis</emphasis> emphasized in
bold.</para>
```

Example 2: Use of the over-line function for the signal name CONTROL:

```
<para>Pin 12 carries the negatively going signal <emphasis
emphasisType="em04">CONTROL</emphasis> which goes more negative
when active.</para>
```

### 2.1.9 Symbol

**Description:** The element <symbol> contains illustrations and graphics that are intended to be presented inline within the normal text. Symbols must be controlled using the ICN, as described in Chap 4.4. However, the ICN must not be presented.

**Markup element:** <symbol> (O)

**Attributes:**

- applicRefId (O), the applicability information by referencing the element <applic> as described in Chap 3.9.5.3
- id (O), the identifier of the symbol element. Refer to Chap 3.9.5.2.1.2.
- infoEntityIdent (M), the ID/IDREF mechanism. Refer to Chap 3.9.5.2.1.7.
- reproductionHeight (O), reproductionWidth (O), and reproductionScale (O), the presentation sizes and scaling for the presentation system
- xlink:type (O), the attribute used to specify link type. This attribute can have the following values:
  - "simple" - the reference to a single target object, the normal case
  - "extended" - the reference to multiple target objects
- xlink:href (O), the attribute used to specify remote resource
- xlink:title (O), the attribute used to used to describe the meaning of a link or resource in a human-readable fashion
- xlink:show (O), the attribute used to used to describe how the reference will show. This attribute can have the following values:
  - "new" - opens a new window to display the information
  - "replace" - replaces the current window with the displayed information
  - "embed" - embeds the information inline
  - "other" - defined by user
  - "none" - does not display the information
- xlink:acutate (O), the attribute used to used to describe if the data will be displayed automatically or on click. This attribute can have the following values:
  - "onLoad" - displays the information when the page loads
  - "onRequest" - displays the information on user click
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Sizes and scaling of symbols

**Markup example:**

The following example shows a paragraph with a symbol which is intended to be displayed inline.

```
<para>When this condition occurs the symbol
<symbol infoEntityIdent="ICN-S1000DBIKE-AAA-DA10000-0-U8025-
09999-A-01-1"></symbol> will show on the display.</para>
```

### 2.1.10 Subscript

**Description:** The element <subScript> contains the text that is intended to be presented subscripted.

**Markup element:** <subScript> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the element <subScript>

**Markup example:**

The following example shows a paragraph with text that is subscripted:

```
<para>The chemical symbol for water is H
<subScript>2</subScript>O.</para>
```

### 2.1.11 Superscript

**Description:** The element <superScript> contains the text that is intended to be presented superscripted.

**Note**

Superscript is the default value for inline and table footnotes.

**Markup element:** <superScript> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the element <superScript>

**Markup example:**

The following example shows a paragraph with text that is superscripted:

```
<para>The symbol for a square meter is m
<superScript>2</superScript>.</para>
```

### 2.1.12 Footnote

**Description:** The element <footnote> contains can eg bibliographic references or explanations which would take too much space or in any other way would be annoying for the reader.

The element <footnote> is a wrapper around the contents of a footnote. The element <footnote> typically generates a marker (eg a superscripted number) at the place in the flow of the document where it occurs. The footnote itself is then generally presented at the bottom of the page or the end of the table.

Footnotes are used in tables (table footnotes) or in regular text and titles (inline footnotes)

Footnotes must not

- be used for references and cross-references
- include footnotes

It is recommended to use only one type of footnote marker for each of the table footnotes and inline footnotes throughout a project. It is recommended that the superscripted numbers are used for both.

**Note**

Additional information that can be useful to the user to understand descriptive information, to carry out an action etc, can be presented in notes. Refer to Chap 3.9.3.

**Note**

The use of footnotes puts demands on the presentation of the footnote markers and the footnotes themselves. Project decisions on the presentation have to be made dependant on the publishing as page-oriented or IETP or both. Refer to Chap 6.2 and Chap 6.3.

**Markup element:** <footnote> (O)

**Attributes:**

- applicRefId (O), the applicability information by referencing the element <applic> as described in Chap 3.9.5.3
- id (O), the identifier of the footnote element. Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1
- footnoteMark (O), the type of footnote marker to be used to identify the footnote. Only one type of footnote marker must be used for each of the table footnotes and inline footnotes throughout a data module. This attribute can have the following values:
  - "num" (D) - superscripted numbers will be used
  - "sym" - symbols such as asterisk (*) and dagger (†) will be used
  - "alpha" - alpha characters will be used
- securityClassification (O), commercialClassification (O) and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6

**Child elements:**

- <para> (M), repeatable, is used to include the footnote text. Refer to Para 1.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use of footnotes
- Determine footnote marker type

**Markup example:**

Example 1: An inline page footnote:

```
<para>This paragraph includes a footnote. I would like to
further define a footnote<footnote id="ftn-1234"
footnoteMark="num"><para>A footnote is used to further define
information and it is printed at the bottom of the
page</para></footnote> and where the footnote is printed.</para>
```

Example 2: Table footnotes:

```
<table frame="topbot">
<title>Example table with footnotes</title>
<tgroup cols="3">
<colspec colnum="1" colname="col1"/>
<colspec colnum="2" colname="col2"/>
<colspec colnum="3" colname="col3"/>
<thead>
<row rowsep="1">
<entry><para>Col 1 Heading</para></entry>
<entry><para>Col 2 Heading</para></entry>
<entry><para>Col 3 Heading</para></entry>
</row>
</thead>
<tfoot>
<row>
<entry namest="col1" nameend="col3"><para>This is footer
information and spans the bottom of the table. The footer could
be table information such as "All units are measured in inches".
</para></entry>
</row>
</tfoot>
<tbody>
<row>
<entry><para>Row 1 entry 1 has a footnote<footnote id="ftn-
0001"><para>This is a footnote for entry
1</para></footnote></para></entry>
<entry><para>Row 1 entry 2</para></entry>
<entry><para>Row 1 entry 3</para></entry>
</row>
<row>
<entry><para>Row 2 entry 1 continues on a second
line</para></entry>
<entry><para>Row 2 entry 2</para></entry>
<entry><para>Row 2 entry 3 uses the first footnote for the
second time<footnoteRef internalRefId="ftn-
0001"/></para></entry>
</row>
<row rowsep="1">
<entry><para>Row 3 entry 1 also has a footnote<footnote id="ftn-
0002"><para>Second footnote</para></footnote></para></entry>
<entry><para>Row 3 entry 2</para></entry>
<entry><para>Row 3 entry 3</para></entry>
</row>
</tbody>
</tgroup>
</table>
```

### 2.1.13 Footnote reference

**Description:** The element <`footnoteRef`> contains the link to a previously defined footnote. The same link is used to reference the same footnote many times.

**Markup element:** <footnoteRef> (O)

**Attributes:**

– internalRefId (O), the target id of the footnote. Refer to Chap 3.9.5.2.1.2.

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

The following markup example illustrates a footnote reference:

```
<para>This paragraph includes the same footnote<footnoteRef
internalRefId="ftn-1234"/>given in the previous paragraph</para>
```

### 2.1.14 Acronym

**Description:** The element <acronymTerm> contains the acronym itself and the definition of the acronym when that acronym is first used.

Separately, the element <acronymTerm> can be used to indicate the acronym and refer to its definition by using the attribute internalRefId. Refer to Para 2.1.14.1.

**Markup element:** <acronym> (O)

ICN-S3627-S1000D0540-001-01

*Fig 5 Element <acronym>*

**Attributes:**

– id (O), the identifier of the acronym element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1
– acronymType (O), the type of acronym. This attribute can have the following values:
  - "at01" - "at99". Refer to Chap 3.9.6.1.
– authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11
– securityClassification (O), commercialClassification (O) and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6

**Child elements:**

– <acronymTerm> (M), the acronym. Refer to Para 2.1.14.1.
– <acronymDefinition> (M), the definition of the acronym when that acronym is first used. Refer to Para 2.1.14.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the element <acronym>

**Markup example:**

```
<acronym id="acr-0001">
<acronymTerm>ASD</acronymTerm>
<acronymDefinition>AeroSpace and Defence Industries Association
of Europe</acronymDefinition>
</acronym>
```

2.1.14.1 Acronym term

**Description:** The element <acronymTerm> contains the acronym itself and a reference to its definition.

**Markup element:** <acronymTerm> (M)

**Attributes:**

– internalRefId (O), the target id of the acronym definition to be reused. Refer to Chap 3.9.5.2.1.2

**Child elements:**

– <subScript> (O),the items to be subscripted. Refer to Para 2.1.10
– <superScript> (O), the items to be superscripted. Refer to Para 2.1.11

**Business rules decisions:**

– None identified

**Markup example:**

The following example shows the coding of an acronym and its reuse by the attribute internalRefId:

```
<acronym id="acr-0001">
<acronymTerm>ASD</acronymTerm>
<acronymDefinition>AeroSpace and Defence Industries Association
of Europe</acronymDefinition>
</acronym>
…
<acronymTerm internalRefId="acr-0001">ASD</acronymTerm>
```

2.1.14.2 Acronym definition

**Description:** The element <acronymDefinition> contains the definition of the acronym when that acronym is first used.

**Markup element:** <acronymDefinition> (O)

**Attributes:**

– id (O), the identifier of the element acronym definition. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1
– authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11

- `securityClassification` (O), `commercialClassification` (O) and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6

**Child elements:**

- <`subScript`> (O), the items to be subscripted. Refer to Para 2.1.10.
- <`superScript`> (O), the items to be superscripted. Refer to Para 2.1.11.

**Business rules decisions:**

- None identified

**Markup example:**

The following example shows the coding of an acronym definition:

```
<acronymDefinition>AeroSpace and Defence Industries Association
of Europe</acronymDefinition>
```

### 2.1.15 Verbatim text

**Description:** The element <`verbatimText`> contains text that is supposed to be presented with as little content distorting formatting applied. Typically, using the element <`verbatimText`>, the verbatim text is included to represent and show information like computer program text, non-proportional screen display text.

When the element is applied to contain markup information, that content must be entered in such a way that the contained marked up information does not interfere with the data module markup itself. One way to contain markup type of information in element <`verbatimText`> is to apply a CDATA marked section to represent the information. This will also retain line feeds, etc.

**Markup element:** <`verbatimText`> (O)

**Attributes:**

- `id` (O), the identifier of the element verbatim. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1
- `verbatimStyle` (O), the style of verbatim text in the cases where there are more than one type of verbatim information and the types should be recognized and/or presented differently. This attribute can have the following values:
  - "`vs01`" - "`vs99`", refer to Chap 3.9.6.1
- `securityClassification` (O), `commercialClassification` (O) and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use of values for attribute `verbatimStyle`

**Markup example:**

Example 1: A paragraph containing a PC command line sequence (used this way, line feeds will normally be dropped):

```
<para>
<verbatimText>
C:\>cd C:\BikeDS\the_text_xml

C:\BikeDS\the_text_xml>dir data module code-S1000DBIKE-AAA-DA0-
20*.* /b
data module code-S1000DBIKE-AAA-DA0-20-00-0000-412A-A_000-02.XML
data module code-S1000DBIKE-AAA-DA0-20-00-0000-520A-A_000-02.XML

C:\BikeDS\the_text_xml>
</verbatimText>
</para>
```

Example 2: The markup for the same paragraph as in Example 1 containing a PC command line sequence using a CDATA marked section (this way, line feeds will be retained.):

```
<para>
<verbatimText>
<![CDATA[
C:\>cd C:\BikeDS\the_text_xml

C:\BikeDS\the_text_xml>dir DMC-S1000DBIKE-AAA-DA0-20*.* /b
DMC-S1000DBIKE-AAA-DA0-20-00-0000-412A-A_000-02.XML
DMC-S1000DBIKE-AAA-DA0-20-00-0000-520A-A_000-02.XML

C:\BikeDS\the_text_xml>
]]>
</verbatimText>
</para>
```

Example 3: A paragraph of tagged text (such as XML) using a CDATA marked section:

```
<para>
<verbatimText>
<![CDATA[
<para>For a full description of the headset,
refer to <dmRef xlink:type="simple"
xlink:actuate="onRequest" xlink:show="replace"
xlink:href=
"URN:S1000D:DMC-S1000DBIKE-AAA-DA2-30-00-00AA-041A-A">
<dmRefIdent><dmCode modelIdentCode="S1000DBIKE"
systemDiffCode="AAA" systemCode="DA2" subSystemCode="3"
subSubSystemCode="0" assyCode="00" disassyCode="00"
disassyCodeVariant="AA" infoCode="041" infoCodeVariant="A"
itemLocationCode="A"/></dmRefIdent>
</dmRef>.</para>
]]>
</verbatimText>
</para>
```

Example 4: A paragraph of tagged text (such as XML) using parameter entities to avoid tag character conflicts (in this case line feeds will normally be dropped):

```
<para>
<verbatimText>
&lt;para&gt;For a full description of the headset,
```

```
refer to &lt;refdm xlink:type="simple"
xlink:actuate="onRequest" xlink:show="replace"
xlink:href=
"URN:S1000D:DMC-S1000DBIKE-AAA-DA2-30-00-00AA-041A-A"&gt;
&lt;modelic&gt;S1000DBIKE&lt;/modelic&gt;
&lt;sdc&gt;AAA&lt;/sdc&gt;
&lt;chapnum&gt;DA2&lt;/chapnum&gt;
&lt;section&gt;3&lt;/section&gt;
&lt;subsect&gt;0&lt;/subsect&gt;
&lt;subject&gt;00&lt;/subject&gt;
&lt;discode&gt;00&lt;/discode&gt;
&lt;discodev&gt;>AA&lt;/discodev&gt;
&lt;incode&gt;041&lt;/incode&gt;
&lt;incodev&gt;A&lt;/incodev&gt;
&lt;itemloc&gt;A&lt;/itemloc&gt;
&lt;/refdm&gt;.&lt;/para&gt;
</verbatimText>
</para>
```

Example 5: A paragraph of text containing an example of inline xml text that has to be recognized in its context:

```
<para>This is a running text demonstrating how the attribute
<verbatimText verbatimStyle="vs01">verbatimStyle</verbatimText>
itself could be marked up in some context.</para>
```

This text would typically be presented as:

"This is a running text demonstrating how the attribute `verbatimStyle` itself could be marked up in some context."

### 2.1.16 Name

**Description:** The element <`name`> contains the name of the function, circuit breaker, controls and indicators, zone or access point. If technical repositories are used in the authoring process, the name is optional as it will be populated during the publication process.

**Markup element:** <`name`> (O)

**Attributes:**

– `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1

**Child elements:**

– None

**Business rules decisions:**

– None identified

## 2.2 Simple paragraph

**Description:** The element <`simplePara`> contains a minimum set of text subelements. It is used where the full set of elements that are available in a full paragraph (element <`para`>) are not required. Simple paragraphs are used in eg the element <`reasonForUpdate`> and the element <`remarks`>.

**Markup element:** <`simplePara`>

**Attributes:**

- `id` (O), the identifier of the element simple paragraph. Refere to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11
- `securityClassification` (O), `commercialClassification` (O) and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6

**Child elements:**

- <`subScript`> (O), the items to be subscripted. Refer to Para 2.1.10.
- <`superScript`> (O), the items to be superscripted. Refer to Para 2.1.11.

**Business rules decisions:**

- None identified

**Markup example:**

```
<reasonForUpdate>
<simplePara>Updated to include requirements of modification JS-
P-ORT-1ON</simplePara><simplePara>Updated to include
requirements of scheme ME-BAB1EE</simplePara>
</reasonForUpdate >
```

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use of the attribute `circuitBreakerAction`.** The project or the organization must decide whether to use the attribute `circuitBreakerAction` or not, and, if used establish writing rules to ensure that authors will be consistent in the paragraph text and the value of the attribute itself. Refer to Para 2.1.1.

**Use of the attribute `checkSum`.** The project or the organization must decide whether to use the attribute `circuitBreakerAction` or not, and, if used how to populate the attribute. Refer to Para 2.1.1.

**Use of the attribute `controlIndicatorNumber`.** The project or the organization must decide whether to use the attribute `controlIndicatorNumber` or not. Refer to Para 2.1.2.

**Types of inline significant data to markup.** If using paragraph significant data markup, the project or the organization must decide which types of data to mark up and in what contexts. The project or the organization must also consider that data modules can be less portable if the paragraph significant data types are extended in the BREX file past the standard types. Refer to Para 2.1.3.

**Types of quantity data to markup.** If using quantity data markup, the project or the organization must decide which types of data to mark up and in what contexts. The project or the organization must also consider that data modules can be less portable if the quantity data types are extended in the BREX file past the standard types. Refer to Para 2.1.4.

**Level of implementation.** The project or the organization must decide whether to use quantity data markup and to what extent it is used. The quantity data markup can be used with or without using the value and tolerance decomposition. Refer to Para 2.1.4.

**Use of unit of measure.** If using the value and tolerance decomposition, the project or the organization must decide at which level of the markup that the unit of measure is to be applied. A consistent usage of unit of measure is required to produce a consistent display or printout to the user. Refer to Para 2.1.4.1.

**Types of unit of measure.** If using the value and tolerance decomposition, the project or the organization must decide which unit of measure types to allow. Due to the large number of units of measure, it is expected that a project will only use a small subset of the available units of measure. The project or the organization must also consider that data modules can be less portable if the units of measure types are extended in the BREX file past the standard types. Refer to Para 2.1.4.1.

**Use of the element <`zoneRef`>.** The project or the organization must decide whether to use the element <`zoneRef`> element or not, and how to use it. Consideration for duplication and mismatch of data given in the maintenance planning information has to be taken. Refer to Para 2.1.5.

**Use of the element <`accessPointRef`>.** The project or the organization must decide whether to use the element <`accessPointRef`> or not, and how to use it. Consideration for duplication and mismatch of data given in the maintenance planning information has to be taken. Refer to Para 2.1.5.

**Definitions of attribute values for `accessPointTypeValue`.** The project or the organization must decide the use of values and allocate suitable definitions to them in the project or organization business rules. Refer to Chap 3.9.6.1 and Para 2.1.5.

**Use of indexing.** The project or the organization must decide whether an index is required and to what level indexing should be made. Refer to Para 2.1.7.

**Definitions of attribute values.** The project or the organization must decide the use of attribute `emphasisType` values and allocate suitable definitions to them in the project business rules. Refer to Chap 3.9.6 and Para 2.1.8.

**Size and scaling of symbols.** The project or the organization must decide the sizes and scaling of symbols. Refer to Para 2.1.9.

**Use of the element <`subScript`>.** The project or the organization must decide on the use of this element. Refer to Para 2.1.10.

**Use of the element <`superScript`>.** The project or the organization must decide on the use of this element. Refer to Para 2.1.11.

**Use of the element <`footnotes`>.** The project or the organization must decide if footnotes are used or not, or be limited to regular text and titles (inline) or tables (table footnotes). Refer to Para 2.1.12.

**Note**

The use of footnotes puts demands on the presentation of the footnote markers and the footnotes themselves. Project decisions on the presentation have to be made dependant on the publishing as page-oriented or IETP or both. Refer to Chap 6.2 and Chap 6.3.

**Determine footnote mark type.** It is recommended to use only one type of footnote marker for each of the table footnotes and inline footnotes throughout a project. It is recommended that the superscripted numbers are used for both. Refer to Para 2.1.12.

**Use of the element <`acronyms`>.** The project or the organization must decide whether acronyms will be indicated with markup. Refer to Para 2.1.14.

**Use of attribute `verbatimStyle`**. The project or the organization must decide the use of values and allocate suitable definitions to them in the project or organization business rules. Refer to Chap 3.9.6.1 and Para 2.1.15.

| Chap No./Document No. | Title |
|---|---|
| Chap 3.9.5.2.1.11 | Common constructs - Controlled content |

## 1 General

This chapter gives rules and guidance for marking controlled content within the content section of data modules.

There are cases where data receivers are offered the opportunity to augment or modify technical content prior to its publication. This content is referred to as controlled content.

## 2 Controlled content

The attributes indicating that an element contains controlled content are present on many of the elements in the data module structures.

### 2.1 Controlled content requirements

The requirements for controlled content can be summarized as:

- Controlled content that is not originator content must be identified
- Controlled content must identify the entity that controls the content, and, optionally, related authority documentation
- The identification of controlled content must remain persistent across revisions
- The data receiver must be able to clearly identify controlled content

## 2.2 Marking an element as controlled content

When applying controls over elements, the effect of the control propagates downward through the hierarchy. Controlled content is indicated by setting the values of the attributes. When there is the need to mark controlled content, the attribute `authorityName` must be used.

**Attributes:**

– `authorityName` (M) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Presentation**. The project or the organization must decide the method of presentation for controlled content. Refer to Para 2.

# 4 Examples

The following markup example shows that the second element of type <`proceduralStep`> is originated by the data receiver identified by the 3-letter attribute `authorityName` value of "`xyz`".

```
<proceduralStep>
<para>This is normal procedural step content</para>
<proceduralStep>
<para>This is normal originator owned content</para>
</proceduralStep>
<proceduralStep authorityName="xyz" authorityDocument="xyz-prod-
1">
<para>This content is controlled by data receiver xyz</para>
</proceduralStep>
</proceduralStep>
```

# 1 General

This chapter contains the definition and handling of the element <commonInfo> from an author's point of view. It gives details about the available elements and attributes and how to use them to populate <commonInfo>.

Common information is used to provide data to the user that applies to the entire data module. The information can contain a general description or introduction of the task or subtask contained in the data module. The element <commonInfo> must not contain procedural steps.

The element <commonInfo> is contained in the procedural, fault, checklist, and maintenance planning data modules.

# 2 Common information

ICN-XXXXX-S1000D-00001-001-01

*Fig 1 Element <commonInfo>*

## 2.1 Definition

**Description:** The element <commonInfo> contains descriptive information that applies to an entire data module.

**Markup element:** <commonInfo> (M)

**Attributes:**

– None

**Child elements:**

– <title> (O). Refer to Chap 3.9.5.2.1.5.
– <figure> (O). Refer to Chap 3.9.5.2.1.7.
– <note> (C). Refer to Chap 3.9.3.
– <para> (C). Refer to Chap 3.9.5.2.1.10.

– <commonInfoDescrPara> (M). Refer to Para 2.1.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of common information (element <commonInfo>)

**Markup example:**

Refer to Para 4 for a complete markup example.

```
<commonInfo>
<commonInfoDescrPara>
...
</commonInfoDescrPara>
</commonInfo>
```

### 2.1.1 Paragraph text

2.1.1.1 Definition

The common information text can be marked up using one of two methods. One method makes use of an optional element <note>, one or more element <para>, and optional and repeatable element <commonInfoDescrPara>. The other method makes use of one or more element <commonInfoDescrPara>.

2.1.1.2 Descriptive Paragraph Definition

**Description:** The element <commonInfoDescrPara> is used to contain text information.

**Markup element:** <commonInfoDescrPara> (C)

**Attributes:**

– applicRefId (O), the applicability information. Refer to Chap 3.9.5.3
– id (O), the identifier of the <commonInfoDescrPara> element. Refer to Chap 3.9.5.2.1.2
– changeMark (O), changeType (O) and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1
– securityClassification (O), commercialClassification (O) and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6
– authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11

**Child elements:**

– <warning> (O). Refer to Chap 3.9.3.
– <caution> (O). Refer to Chap 3.9.3.
– <note> (O). Refer to Chap 3.9.3.
– <circuitBreakerDescrGroup> (O). Refer to Chap 3.9.5.2.1.10.
– <para> (O). Refer to Chap 3.9.5.2.1.10.
– <figure> (O). Refer to Chap 3.9.5.2.1.7.
– <multimedia> (O). Refer to Chap 3.9.2.4.
– <foldout> (O). Refer to Chap 3.9.5.2.1.7.
– <table> (O). Refer to Chap 3.9.5.2.1.6.
– <commonInfoDescrPara> (O).

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Markup method for common information text.

**Markup example:**

Refer to Para 4 for a complete markup example.

```
<commonInfoDescrPara>
<para>
...
</para>
</commonInfoDescrPara>
```

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use of common information**. The project or the organization must decide whether to use the element <commonInfo> in procedural, maintenance planning, and/or fault data modules or not. Refer to Para 2.

**Markup method for common information text**. The project or the organization must decide whether to use the markup method containing <note>, <para> and <commonInfoDescrPara> or the method containing only <commonInfoDescrPara>. Refer to Para 2.1.1.

# 4 Examples

The following markup examples demonstrate the use of the <commonInfo> element.

```
<commonInfo>
<title>General Information</title>
<commonInfoDescrPara>
<title>Components Involved in an Accident</title>
<para>Any component removed for reason of accident shall be
preserved and shall be shipped in the same condition it was in
after the accident</para>
</commonInfoDescrPara>
</commonInfo>
```

```
<commonInfo>
<title>Special Instructions</title>
<commonInfoDescrPara>
<para>The columns headed I and P are used to indicate the
requirements for Intermediate and Periodic inspections
respectively. When item is required with a frequency other than
that indicated by these column headings, the proper frequency is
indicated in the appropriate column.</para>
</commonInfoDescrPara>
<commonInfoDescrPara>
<para>Work time requirements for individual items are stated in
the W/T column.</para>
</commonInfoDescrPara>
</commonInfo>
```

```
<commonInfo>
<title>Condition Inspection</title>
<para>Operators have periodically experienced fram vibration and
```

```
have had difficulty identifying the cause of vibration.
Troubleshooting frame vibration can consume a number of man-
hours and cause considerable amount of concern. This procedure
proivdes a compliation of known causes of frame vibration and
the required corrective action.</para>
</commonInfo>
```

## 1 General

This Schema is used to capture and represent descriptive information.

The granularity of descriptive data modules must follow the breakdown reflected by the SNS providing descriptions at:

- system
- subsystem
- sub-subsystem levels

as required by the:

- maintenance philosophy
- scope of information required

For details on the scope of information, refer to Chap 5.2.1.2.

The granularity must be determined by the project or the organization.

# 2 Descriptive information

## 2.1 Description

**Description:** The element <description> is used to contain the descriptive information. Descriptive paragraphs can be broken down into subparagraphs, which can be broken down further into sub-subparagraphs and so on. The depth of this breakdown is unlimited, however, it is recommended to not exceed five levels of depth. It is further recommended that additional levels only be used in a conversion effort, where existing data is authored to such a depth and restructuring of data is not feasible. In these cases, the subparagraph breakdown must never exceed eight levels of depth. The project or the organization must decide on the depth of breakdown.

**Note**

The descriptive data module uses common constructs. For the detailed explanations and rules for common constructs, refer to Chap 3.9.5.2.1.

**Markup element:** <description> (M)

ICN-83007-0000000054-001-01

*Fig 1 Element <description>*

**Attributes:**

- `warningRefs` (O), the warning reference to the warnings and cautions collection. Refer to Chap 3.9.3.
- `cautionRefs` (O), the caution reference to the warnings and cautions collection. Refer to Chap 3.9.3.

**Child elements:**

- <para> (O). Refer to Chap 3.9.5.2.1.10.
- <warning> (O). The use of warnings in descriptive information is a project or an organization decision. Refer to Chap 3.9.3.
- <caution> (O). The use of cautions in descriptive information is a project or an organization decision. Refer to Chap 3.9.3.
- <note> (O). Refer to Chap 3.9.3.
- <levelledPara> (O). Refer to Chap 3.9.5.2.1.10.
- <figure> (O). Refer to Chap 3.9.5.2.1.7.
- <multimedia> (O). Refer to Chap 3.9.2.
- <foldout> (O). Refer to Chap 3.9.5.2.1.7 and Chap 3.9.5.2.1.6.
- <table> (O). Refer to Chap 3.9.5.2.1.6.
- <caption> (O). Refer to Chap 3.9.5.2.1.4.

**Business rules decisions:**

- paragraph depth
- occurrences of subparagraphs

– use of warnings and cautions

**Markup example:**

Refer to Para 4.

## 2.2 Levelled paragraphs

**Description:** The element <`levelledPara`> is the equivalent of a headed paragraph and subparagraphs. It can have one or more <`levelledPara`> elements nested within it. The depth of this structure is unlimited, however, it is recommended to not exceed five levels of depth. It is further recommended that additional levels only be used in a conversion effort, where existing data is authored to such a depth and restructuring of data is not feasible. In these cases, the structure must never exceed eight levels of depth. The project or the organization must decide on the depth of breakdown.
The Schema allows for a single occurrence of <`levelledPara`> under a parent <`levelledPara`>. The project or organization must decide whether to allow this structure in their descriptive data modules or to insist on a minimum occurrence of two <`levelledPara`> elements.

**Markup element:** <`levelledPara`> (O)

ICN-83007-0000000061-001-01

*Fig 2 Element* <`levelledPara`>

**Attributes:**

- `applicRefId` (O), the applicability information. Refer to Chap 3.9.5.3.
- `id` (O), the identifier of the [*insert description*] element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O) and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `warningRefs` (O), the warning reference to the warnings and cautions collection. Refer to Chap 3.9.3.
- `cautionRefs` (O), the caution reference to the warnings and cautions collection. Refer to Chap 3.9.3.

- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- `securityClassification` (O), `commercialClassification` (O) and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <`title`> (O). Refer to Chap 3.9.5.2.1.5.
- <`captionGroup`> (O). Refer to Chap 3.9.5.2.1.4.
- <`warning`> (O). The use of warnings in descriptive information is a project or an organization decision. Refer to Chap 3.9.3.
- <`caution`> (O). The use of cautions in descriptive information is a project or an organization decision. Refer to Chap 3.9.3.
- <`note`> (O). Refer to Chap 3.9.3.
- <`circuitBreakerDescrGroup`> (O). Refer to Chap 3.9.5.2.11.2.
- <`para`> (O). Refer to Chap 3.9.5.2.1.10.
- <`figure`> (O). Refer to Chap 3.9.5.2.1.7.
- <`multimedia`> (O). Refer to Chap 3.9.2.
- <`foldout`> (O). Refer to Chap 3.9.5.2.1.7 and Chap 3.9.5.2.1.6.
- <`table`> (O). Refer to Chap 3.9.5.2.1.6.
- <`caption`> (O). Refer to Chap 3.9.5.2.1.4.
- <`levelledPara`> (O)

**Business rules decisions:**

- paragraph depth
- occurrences of subparagraphs
- use of warnings and cautions

**Markup example:**

Refer to Para 4.

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Granularity of data modules**. The project or the organization must define the granularity of data modules. Refer to Para 1.

**Paragraph depth.** The project or the organization must decide on the depth of breakdown for paragraphs. Refer to Para 2.2.

**Occurrences of subparagraphs.** The project or the organization must decide whether to allow this breakdown in their descriptive data modules or to insist on a minimum of two subparagraphs or not. Refer to Para 2.2.

**Use of warnings and cautions.** The project or the organization must decide whether to use warnings and cautions in descriptive information. Refer to Para 2.1 and Para 2.2.

# 4 Examples

```
<levelledPara>
<title>The bicycle wheel</title>
<para>The wheel (refer to <internalRef internalRefId="fig-0001"
internalRefTargetType="figure"></internalRef>) of a bicycle is a
complex structure. The wheel assembly has these parts:
```

```
<randomList listItemPrefix="pf01">
<listItem>the tire</listItem>
<listItem>the tube</listItem>
<listItem>the spokes</listItem>
<listItem>the spoke nipples</listItem>
<listItem>the valve</listItem>
<listItem>the hub</listItem>
</randomList>
On their own, the individual components are not very strong.
But, when they are installed together, the components make the
complete wheel (refer to <internalRef internalRefId="fig-0001"
internalRefTargetType="figure"></internalRef>). The complete
wheel is resistant to almost any type of heavy loads and
operation.</para>
<figure id="fig-0001">
<title>Parts of the wheel</title>

00504-A-03-1" reproductionWidth="510"></graphic>
</figure>
<levelledPara id="par-0001">
<title>Spokes</title>
<para>The spokes go out from the hub and go across and below
each other. The spoke nipples attach the spokes to the rim
with the threads on the end of the spokes. You can use the
spoke nipples to adjust the tension of the spokes.
The tension on each of the spokes must be equal.</para>
</levelledPara>
<levelledPara id="par-0002">
<title>Wheel rim</title>
<para>The rim (refer to <internalRef internalRefId="fig-0002"
internalRefTargetType="figure"></internalRef>) of the wheel has
a lining of rim tape. This tape protects the tube from damage
that the rough edges on the spoke nipples can cause.</para>
<figure id="fig-0002">
<title>The tire and rim</title>
<graphic infoEntityIdent="ICN-S1000DBIKE-AAA-DA00000-0-U8025-
00504-B-03-1" reproductionWidth="510"></graphic>
</figure>
</levelledPara>
<levelledPara id="par-0003">
<title>Tube and tire</title>
<para>The tube and the tire install on the rim. The sidewalls of
the tire have markings on them. These which are used to indicate
the correct direction of rotation. The markings also make sure
the tire installs on the rim and that the directional arrows
points in the correct direction. You install the tube into the
tire before you inflate it. The tube has a valve (refer to
<internalRef internalRefId="fig-0003"
internalRefTargetType="figure"></internalRef>) which you put
through the hole in the rim. This valve (refer to <internalRef
internalRefId="fig-0003"
internalRefTargetType="figure"></internalRef>)is used to inflate
the tube and the tire to the correct pressure. A dust cap
installs on the valve (refer to <internalRef internalRefId="fig-
0003" internalRefTargetType="figure"></internalRef>)to prevent
damage that dust and debris can cause.</para>

# 1 General

The procedural Schema is used to capture and represent procedural information. The granularity of maintenance procedural data modules is to follow the breakdown reflected by the SNS, the information codes and should reflect the tasks identified in the maintenance plan. The granularity of crew/operator procedural data modules is to follow the breakdown reflected by the SNS, information codes and should reflect the operation identified. The use of the common entities, elements and attributes is to be as detailed in Chap 3.9.5.2.1.

# 2 Procedural information

## 2.1 Schema basic rules

The procedural Schema has structural elements that are used to provide a hierarchy of steps and substeps. Note that if a condition applies to a step or substep, then that condition also applies to all its substeps.

## 2.2 Content

This procedural Schema can be used for all types of information of procedural or instructional type. Eg for the technical content in maintenance procedures, refer to Chap 5.2.1.3.1.

ICN-S3627-S1000D0498-001-01

*Fig 1 Major elements in procedural content*

**Attributes:**

– id (O), the identifier of the <content> element. Refer to Chap 3.9.5.2.1.2.

## 2.3 References

References, element <refs> must be populated in accordance with Chap 3.9.5.2.1.2.

## 2.4 Warnings and cautions collection

The collection of warnings and cautions, element <warningAndCautions> must be populated in accordance with Chap 3.9.3.

## 2.5 Procedure

**Description:** The element <procedure> contains all information necessary to carry out the task or the main objective of the procedural information.

**Markup element:** <procedure> (M)

ICN-S3627-S1000D0499-001-01

*Fig 2 Element <procedure>*

**Attributes:**

– None

**Child elements:**

– <commonInfo> (O). Refer to Chap 3.9.5.2.1.12.
– <preliminaryRqmts> (M). Refer to Chap 3.9.5.2.1.9.
– <mainProcedure> (M). Refer to Para 2.6.
– <closeRqmts> (M). Refer to Chap 3.9.5.2.1.9.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– use of the optional element <commonInfo>

**Markup example:**

– Refer to Para 4.

## 2.6 Main procedure

**Description:** The element <mainProcedure> contains the detailed procedural steps to be done, properly supported by figures, multimedia, foldouts and tables.

**Markup element:** <mainProcedure> (M)

ICN-S3627-S1000D0500-001-01

*Fig 3 Element <mainProcedure>*

**Attributes:**

- id (O), the identifier of the <mainProcedure> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- skillLevelCode (O), the skill level required for the complete procedure. Refer to Chap 3.9.5.1. This attribute can have the following values:
  - "sk01" thru "sk99". Refer to Chap 3.9.6.1.
- independentCheck (O), the complete procedure must be checked by a supervisor with a given qualification
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

One or more of the following:

- <proceduralStep> (O). Refer to Para 2.6.1.
- <figure> (O). Refer to Chap 3.9.5.2.1.7.
- <multimedia> (O). Refer to Chap 3.9.2.4.
- <foldout> (O). Refer to Chap 3.9.5.2.1.7.
- <table> (O). Refer to Chap 3.9.5.2.1.6.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of the optional attribute skillLevelCode
- use of the optional attribute independentCheck

**Markup example:**

- Refer to Para 4.

### 2.6.1 Procedural step

**Description:** The element <proceduralStep > contains a step in the procedure. A step can be broken down into substeps by including another element <proceduralStep>, which can itself be broken down further into substeps by including another element <proceduralStep>, and so on following the lower branch in Fig 1. In this way, any depth

of substep breakdown can be achieved. However, it is highly discouraged not to exceed five levels of depth. The substep breakdown must never exceed eight levels of depth (for details, refer to Business rules decisions below).

**Markup element:** <`proceduralStep`> (M)

ICN-S3627-S1000D0501-001-01

*Fig 4 Element <`proceduralStep`>*

**Attributes:**

- `applicRefId` (O), the applicability information. Refer to Chap 3.9.5.3.
- `id` (O), the identifier of the <`proceduralStep`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `warningRefs` (O), the warning reference to the warnings and cautions collection. Refer to Chap 3.9.3.
- `cautionRefs` (O), the caution reference to the warnings and cautions collection. Refer to Chap 3.9.3.
- `independentCheck` (O), the step must be checked by eg a supervisor with a given qualification.
- `skillLevelCode` (O), the skill level required for complete procedure. Refer to Chap 3.9.5.1. This attribute can have the following values:
  - "`sk01`" thru "`sk99`". Refer to Chap 3.9.6.1.
- `keepWithNext` (O), the indication whether a step is presented together with the next step, if possible. This attribute is intended for use only when absolutely necessary in a situation where eg scrolling is not practical for the user or the viewing device does not allow scrolling. This attribute can have the following values:
  - "`0`" (D), No
  - "`1`", Yes - the step is kept with the next sibling step (if one exists) and therefore, all children of the element for which the attribute is set should be kept together as well (if possible). This attribute has no meaning when placed on a final step.
- `itemCharacteristic` (O), used to indicate characteristics of the item that is the subject of a given procedural step. This attribute can have the following values:
  - "`ic00`" thru "`ic99`". Refer to Chap 3.9.6.1.
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <`title`> (O). Refer to Para 2.6.2 for the use of titles. Refer to Chap 3.9.5.2.1.5 for general rules on titles.
- <`warning`> (O). Refer to Para 2.6.3 for the validity of warnings. Refer to Chap 3.9.3 for general rules on warnings.
- <`caution`> (O). Refer to Para 2.6.3 for the validity of cautions. Refer to Chap 3.9.3 for general rules on cautions.
- <`note`> (O). Refer to Chap 3.9.3.
- <`circuitBreakerDescrGroup`> (O). Refer to Chap 3.9.5.2.1.10.
- <`para`> (O). Refer to Chap 3.9.5.2.1.10.
- <`figure`> (O). Refer to Chap 3.9.5.2.1.7.
- <`multimedia`> (O). Refer to Chap 3.9.2.4.
- <`foldout`> (O). Refer to Chap 3.9.5.2.1.7.
- <`table`> (O). Refer to Chap 3.9.5.2.1.6.
- <`caption`> (O). Refer to Chap 3.9.5.2.1.4.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- maximum number of step levels allowed

- minimum number of substeps under a parent
- use of the optional attribute `skillLevelCode`
- use of the optional attribute `independentCheck`
- use of the optional attribute `keepWithNext`
- use of the optional attribute `itemCharacteristic`

**Markup example:**

- Refer to Para 4.

### 2.6.2 Title

**Description:** The element <`title`>is used give the title of the step or a sequence of substeps. The element <`title`>must not be used on a substep when the preceding step or substep does not have a title.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use of titles in procedural steps

### 2.6.3 Warnings, cautions and notes

A warning, caution or note or a warning or caution reference that is placed in a step (element <`proceduralStep`>) applies to all substeps (element <`proceduralStep`>) within. The converse of this does not hold true.

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use of the optional element <`commonInfo`>**. The project or the organization must decide whether to use the element <`commonInfo`> or not, when to use the element, and give guidance and rules that will make sure that it is consistently used. Refer to Para 2.5.

**Use of the optional attribute `skillLevelCode`**. The element <`mainProcedure`> and the element <`proceduralStep`> can contain an indication of the skill level required for the whole procedure and/or for individual steps/substeps using the attribute. The project or the organization must decide whether to use the attribute `skillLevelCode` or not and how to use it. Refer to Para 2.6.

**Use of the optional attribute `independentCheck`**. The element <`mainProcedure`> and the element <`proceduralStep`> can contain a check using the attribute `independentCheck` to indicate that the whole procedure and/or individual steps/substeps must be checked by a supervisor with a given qualification. The project or the organization must decide whether to use the attribute `independentCheck` or not and how to use it. Refer to Para 2.6.

**Maximum number of step levels**. Exceeding a substep breakdown of five levels of depth is highly discouraged in development of new data. It is recommended that additional levels only be used in a conversion effort where the existing data is authored to this depth (maximum eight levels) and restructuring of data is not feasible. The project or the organization must decide on the maximum step levels allowed. Refer to Para 2.6.

**Minimum number of substeps under a parent**. The Schema allows for a single substep under a parent. The project or the organization must decide whether to allow this breakdown in their procedural data modules or to insist on a minimum of two substeps. Refer to Para 2.6.1.

**Use of the optional attribute `keepWithNext`**. The project or the organization must decide whether to use the attribute `keepWithNext` or not. Refer to Para 2.6.1.

**Use of the optional attribute `itemCharacteristic`**. The project or the organization must decide whether to use the attribute `itemCharacteristic` or not and how to use it.

**Use of titles in procedural steps**. The project or the organization must decide whether to use the element <`title`> or not and how to use it. Refer to Para 2.6.1.

# 4 Examples

The following is a markup example of a procedure.

# 1 General

The fault Schema is used to capture and represent fault reporting, fault isolation and fault correlation information. The granularity of these data modules is to follow the breakdown reflected by the SNS.

The use of the common entities, elements and attributes is detailed in Chap 3.9.5.2.1.

# 2 Fault information

## 2.1 Content

**Description:** The fault isolation Schema allows for five types of fault information to be produced as individual data modules. These are fault reporting (in terms of isolated, detected, observed or correlated faults) or fault isolation. Refer to Chap 5.2.1.3.2.

**Markup element:** <content> (M)

**Attributes:**

– `id` (O), the identifier of the <`content`> element. Refer to Chap 3.9.5.2.1.2.

**Child elements:**

– <`refs`> (O). Refer to Chap 3.9.5.2.1.2.
– <`warningsAndCautions`> (O). Refer to Chap 3.9.3.

and one of

– <`faultReporting`> (O). Refer to Para 2.4.
– <`faultIsolation`> (O). Refer to Para 2.5.

ICN-3627-S1000D0502-001-01

</isolatedFault>
</faultReporting>
</content>
```

## 2.2 References

References (element <refs>) must be populated in accordance with Chap 3.9.5.2.1.2.

## 2.3 Warnings and cautions

Warnings and cautions (element <warningsAndCautions>) must be populated in accordance with Chap 3.9.3.

## 2.4 Fault reporting

**Description:** The element <faultReporting > contains information to enable technician or computerized maintenance systems to indicate faults through data modules.

**Markup element:** <faultReporting > (O)

**Attributes:**

– None

**Child elements:**

– <commonInfo> (O). Refer to Chap 3.9.5.2.1.12.
– <preliminaryRqmts> (O). Refer to Chap 3.9.5.2.1.9.

and one of

– <isolatedFault>(O). Refer to Para 2.4.1.
– <detectedFault>(O). Refer to Para 2.4.2.
– <observedFault>(O). Refer to Para 2.4.3.
– <correlatedFault>(O). Refer to Para 2.4.4.

**Business rules decisions:**

– None identified

**Markup example:**

```
<faultReporting>
<isolatedFault id="flt-0003" faultCode="NYCJD03">
<faultDescr>
<detailedFaultDescr>
<systemName>Engine</systemName>
<faultMessageBody>Engine will not start.</faultMessageBody>
</detailedFaultDescr>
</faultDescr>
```

```
<locateAndRepair>
<locateAndRepairLruItem>
<lru>
</lru>
</locateAndRepairLruItem>
</locateAndRepair>
</isolatedFault>
</faultReporting>
```

### 2.4.1 Isolated faults

**Description:** The element <isolatedFault> is used to capture isolated faults information.

**Markup element:** <isolatedFault> (O)

ICN-3627-S1000D0503-001-01

*Fig 2 Element <isolatedFault>*

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the <isolatedFault> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- faultCode (M), the fault code that is allocated as part of a logistic analysis process
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.

**Child elements:**

- <faultDescr> (C). Refer to Para 2.4.1.1.
- <detectionInfo> (O). Refer to Para 2.4.1.3.
- <locateAndRepair> (C). Refer to Para 2.4.1.4.
- <remarks> (O). Refer to Chap 3.9.5.1.

**Business rules decisions:**

- None identified

**Markup example:**

```
<isolatedFault id="flt-0003" faultCode="NYCJD03">
<faultDescr>
<detailedFaultDescr>
<systemName>Engine</systemName>
<faultMessageBody>Engine will not start.</faultMessageBody>
</detailedFaultDescr>
</faultDescr>
```

```
<locateAndRepair>
<locateAndRepairLruItem>
<lru>
</lru>
</locateAndRepairLruItem>
</locateAndRepair>
</isolatedFault>
```

2.4.1.1 Description of the isolated fault

**Description:** The element <faultDescr> contains the description of the isolated fault.

**Markup element:** <faultDescr> (C)

ICN-3627-S1000D0504-001-01

*Fig 3 Element <faultDescr>*

**Attributes:**

- id (O), the identifier of the <faultDescr> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <descr> (O), the textual fault description by the message identification as it is displayed to the maintenance crew.
- <detailedFaultDescr> (O). Refer to Para 2.4.1.2.
- <refs> (O), the references to, if required, other data modules, publication modules or non S1000D publications to complete the description. Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

- None identified

**Markup example:**

```
<faultDescr>
<descr>Horn failed</descr>
</faultDescr>
```

2.4.1.2 Detailed description of the isolated fault

**Description:** The element <detailedFaultDescr> contains the detailed description of the isolated fault.

**Markup element:** <detailedFaultDescr> (O)

**Attributes:**

- id (O), the identifier of the <faultDescr> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

All child elements can have a textual content and all have the same set of attributes as the element <faultDescr >.

- <viewLocation> (O), the physical location on display system
- <systemLocation> (O), the location or panel where the malfunction is shown
- <systemName> (C) , the faulty system
- <faultySubSystem> (O), the faulty subsystem
- <systemIdent> (O), the discriminating identification information to identify the faulty system, eg "yellow" for a hydraulic flag system
- <systemPosition> (O), the discriminating identification information, position-oriented, eg "left"
- <faultEquip>) (O), the equipment involved in the malfunction
- <faultMessageIndication> (O), the indication part of the fault message, eg "temperature"
- <faultMessageBody> (C), the main part of the fault message
- <faultCond> (O), the potential fault condition

**Business rules decisions:**

- None identified

**Markup example:**

```
<detailedFaultDescr>
<systemName>Engine</systemName>
<faultMessageBody>Engine will not start.</faultMessageBody>
</detailedFaultDescr>
```

2.4.1.3 Fault detecting information

**Description:** The element <detectionInfo> contains the information for detecting the fault.

**Markup element:** <detectionInfo> (O)

ICN-3627-S1000D0505-001-01

*Fig 4 Element <detectionInfo>*

**Attributes:**

- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- detectionType (O), the type of fault

**Child elements:**

- <detectedLruItem>. Refer to Para 2.4.1.3.1.

**Business rules decisions:**

- None identified

**Markup example:**

```
<detectionInfo detectionType="Major">
<detectedLruItem>
<lru>
<name>Tire</name>
<identNumber>
<manufacturerCode>KT666</manufacturerCode>
<partAndSerialNumber>
<partNumber>TIRES-010101</partNumber>
</partAndSerialNumber>
</identNumber>
</lru>
</detectedLruItem>
</detectionInfo>
```

*2.4.1.3.1 Detected Line Replaceable Unit (LRU) item*

**Description:** The element <detectedLruItem> contains the identification, name and abbreviation of the detected LRU.

**Markup element:** <detectedLruItem> (C)

**Attributes:**

- id (O), the identifier of the <detectedLruItem> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- faultProbability (O), the probability factor to indicate the likelihood that this particular LRU is faulty
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <lru> (C). Refer to Para 2.4.1.3.2.
- <remarks> (O). Refer to Chap 3.9.5.1.
- <detectSruItem> (O). Refer to Para 2.4.1.3.3.

**Business rules decisions:**

- None identified

**Markup example:**

```
<detectedLruItem>
<lru>
<name>Tire</name>
<identNumber>
<manufacturerCode>KT666</manufacturerCode>
<partAndSerialNumber>
<partNumber>TIRES-010101</partNumber>
</partAndSerialNumber>
</identNumber>
</lru>
</detectedLruItem>
```

*2.4.1.3.2 LRU identification*

**Description:** The element <lru> contains name, a shortname and identification of the LRU.

**Markup element:** <lru> (C)

ICN-3627-S1000D0506-001-01

*Fig 5 Element <lru>*

**Attributes:**

- id (O), the identifier of the <faultDescr> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <name> (O). Refer to Chap 3.9.5.2.1.9.
- <shortName> (O). Refer to Chap 3.9.5.2.1.9.
- The identification by one or more of the elements <catalogSeqNumberRef> <natoStockNumber>, <identNumber> and <toolRef>. Refer to Chap 3.9.5.2.1.9.
- <remarks> (O). Refer to Chap 3.9.5.1.

**Business rules decisions:**

- None identified

**Markup example:**

```
<lru>
<name>Tire</name>
<identNumber>
<manufacturerCode>KT666</manufacturerCode>
<partAndSerialNumber>
<partNumber>TIRES-010101</partNumber>
</partAndSerialNumber>
</identNumber>
</lru>
```

*2.4.1.3.3 Detected Shop Replaceable Unit (SRU) item*

**Description:** The element <detectedSruItem> contains the identification, name and abbreviation of the detected SRU.

**Markup element:** <detectedSruItem> (C)

**Attributes:**

- id (O), the identifier of the <detectedLruItem> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- faultProbability (O), the probability factor to indicate the likelihood that this particular LRU is faulty
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <sru> (C). Refer to Para 2.4.1.3.4.
- <remarks> (O). Refer to Chap 3.9.5.1.

**Business rules decisions:**

- None identified

**Markup example:**

```
<detectedSruItem>
<sru>
<identNumber>
<manufacturerCode>KT666</manufacturerCode>
<partAndSerialNumber>
<partNumber>TIRES-010101</partNumber>
</partAndSerialNumber>
</identNumber>
</sru>
</detectedSruItem>
```

*2.4.1.3.4 SRU identification*

**Description:** The element <sru> contains name, a shortname and identification of the SRU.

**Markup element:** <sru> (C)

**Attributes:**

- id (O), the identifier of the <faultDescr> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <name> (O). Refer to Chap 3.9.5.2.1.9.
- <shortName> (O). Refer to Chap 3.9.5.2.1.9.
- The identification by one or more of the elements <catalogSeqNumberRef> <natoStockNumber>, <identNumber> and <toolRef>. Refer to Chap 3.9.5.2.1.9.
- <remarks> (O). Refer to Chap 3.9.5.1.

**Business rules decisions:**

- None identified

**Markup example:**

```
<sru>
<identNumber>
<manufacturerCode>KT666</manufacturerCode>
<partAndSerialNumber>
<partNumber>TIRES-010101</partNumber>
</partAndSerialNumber>
</identNumber>
</sru>
```

2.4.1.4 Locate and repair/Locate and repair LRU

**Description:** The element <`locateAndRepair`>/<`locateAndRepairLruItem`> contains any locating and repairing tasks and information on the faulty LRU.

**Markup element:** <`locateAndRepair`> (M)

ICN-3627-S1000D0507-001-01

*Fig 6 Element <`locateAndRepair`>/<`locateAndRepairLruItem`>*

**Attributes:**

- `id` (O), the identifier of the <`detectedLruItem`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `faultProbability` (O), the probability factor to indicate the likelihood that this particular LRU is faulty
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <`lru`> (C). Refer to Para 2.4.1.3.2.
- <`repair`> (O). Refer to Para 2.4.1.4.1.
- <`remark`> (O). Refer to Chap 3.9.5.1.
- <`locateAndRepairSruItem`> (O). Refer to Para 2.4.1.4.2.

**Business rules decisions:**

– None identified

**Markup example:**

```
<locateAndRepair>
<locateAndRepairLruItem>
<lru>
</lru>
</locateAndRepairLruItem>
</locateAndRepair>
```

*2.4.1.4.1 Repair*

**Description:** The element <repair> contains any repair procedure.

**Markup element:** <repair> (O)

**Attributes:**

– None

**Child elements:**

– <refs> (M). Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

– None identified

**Markup example:**

```
<repair>
<refs>
<externalPubRef>
<externalPubRefIdent>
<externalPubTitle>External repair publication</externalPubTitle>
</externalPubRefIdent>
</externalPubRef>
</refs>
</repair>
```

*2.4.1.4.2 Locate and repair SRU*

**Description:** The element <locateAndRepairSruItem> contains any locating and repairing tasks and information on the faulty SRU.

**Markup element:** <locateAndRepairSruItem> (C)

**Attributes:**

– id (O), the identifier of the <detectedLruItem> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– faultProbability (O), the probability factor to indicate the likelihood that this particular LRU is faulty
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– <sru> (C). Refer to Para 2.4.1.3.4.

– <repair> (O). Refer to Para 2.4.1.4.1.
– <remarks> (O). Refer to Chap 3.9.5.1.

**Business rules decisions:**

– None identified

**Markup example:**

```
<faultReporting>
<isolatedFault id="flt-0003" faultCode="NYCJD03">
<faultDescr>
<descr>Horn failed</descr>
</faultDescr>
<locateAndRepair>
<locateAndRepairLruItem>
<lru>
<name>Horn</name>
<identNumber>
<manufacturerCode>KZ444</manufacturerCode>
<partAndSerialNumber>
<partNumber>Horn-001</partNumber>
</partAndSerialNumber>
</identNumber>
</lru>
<repair>
<refs>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="DA3" subSystemCode="1" subSubSystemCode="0"

infoCode="921" infoCodeVariant="A" itemLocationCode="A"/>
</dmRefIdent>
</dmRef>
</refs>
</repair>
</locateAndRepairLruItem>
</locateAndRepair>
</isolatedFault>
</faultReporting>
```

### 2.4.2 Detected faults

**Description:** The element <detectedFault> contains information on detected faults.

**Markup element:** <detectedFault> (O)

ICN-3627-S1000D0508-001-01

*Fig 7 Element <detectedFault>*

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the <isolatedFault> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- faultCode (M), the fault code that is allocated as part of a logistic analysis process
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.

**Child elements:**

- <faultDescr> (C). Refer to Para 2.4.1.1.
- <detectInfo> (O). Refer to Para 2.4.1.3.
- <isolateDetectedFault> (O). Refer to Para 2.4.2.1.
- <remarks> (O). Refer to Chap 3.9.5.1.

**Business rules decisions:**

- None identified

**Markup example:**

```
<detectedFault id="flt-0002" faultCode="NYCJD00">
<faultDescr>
<descr>The rear wheel does not operate correctly</descr>
</faultDescr>
<detectionInfo detectionType="Major">
<detectedLruItem>
<lru>
<name>Tire</name>
<identNumber>
<manufacturerCode>KT666</manufacturerCode>
<partAndSerialNumber>
<partNumber>TIRES-010101</partNumber>
</partAndSerialNumber>
</identNumber>
</lru>
</detectedLruItem>
</detectionInfo>
<isolateDetectedFault>
<lruItem>
<lru>
<name>Rear wheel</name>
```

```
<identNumber>
<manufacturerCode>KZ333</manufacturerCode>
<partAndSerialNumber>
<partNumber>WH-001</partNumber>
</partAndSerialNumber>
</identNumber>
</lru>
</lruItem>
</isolateDetectedFault>
<remarks><simplePara>Prepare the rear wheel for the removal of
the tire</simplePara></remarks>
</detectedFault>
```

2.4.2.1 Isolate detected fault

**Description:** The element <isolateDetectedFault > contains the information needed to isolate the detected fault to an LRU from amongst a list of suspected LRU. This is done by referring out to another data module through the element <faultIsolationRef> or by describing a test on these LRU using the element <lruItem>.

**Markup element:** <isolateDetectedFault > (O)

ICN-3627-S1000D0509-001-01

*Fig 8 Element <isolateDetectedFault>*

**Attributes:**

– None

**Child elements:**

– <faultIsolationRef> (O), the reference to information needed to isolate the detected fault
– <lruItem> (M). Refer to Para 2.4.2.1.1.

**Business rules decisions:**

– None identified

**Markup example:**

```
<isolateDetectedFault>
<lruItem>
<lru>
<name>Rear wheel</name>
<identNumber>
<manufacturerCode>KZ333</manufacturerCode>
<partAndSerialNumber>
<partNumber>WH-001</partNumber>
</partAndSerialNumber>
</identNumber>
</lru>
</lruItem>
</isolateDetectedFault>
```

*2.4.2.1.1 Fault isolation test - LRU*

**Description:** The element <`lruItem` > contains the information needed to perform the test on the faulty LRU.

**Markup element:** <`lruItem` > (O)

**Attributes:**

– `id` (O), the identifier of the <`detectedLruItem`> element. Refer to Chap 3.9.5.2.1.2.
– `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– `faultProbability` (O), the probability factor to indicate the likelihood that this particular LRU is faulty
– `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– <`lru`> (O). Refer to Para 2.4.1.3.2.
– <`faultIsolationTest` > (M). Refer to Para 2.4.2.1.2.
– <`repair`> (M). Refer to Para 2.4.1.4.1.
– <`remarks`> (M). Refer to Chap 3.9.5.1.
– <`sruItem`> (C). Refer to Para 2.4.2.1.4.

**Business rules decisions:**

– None identified

**Markup example:**

```
<lruItem>
<lru>
<name>Rear wheel</name>
<identNumber>
<manufacturerCode>KZ333</manufacturerCode>
<partAndSerialNumber>
<partNumber>WH-001</partNumber>
</partAndSerialNumber>
</identNumber>
```

```
</lru>
</lruItem>
```

2.4.2.1.2 *Fault isolation test performance*

**Description:** The element <faultIsolationTest > contains the test description, test parameters and the test procedure.

**Markup element:** <faultIsolationTest > (O)

ICN-3627-S1000D0510-001-01

*Fig 9 Element <faultIsolationTest>*

**Attributes:**

- id (O), the identifier of the <faultIsolationTest> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- testType (M), the name of the type of test
- testCode (M), the code for test
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <testDescr> (O), the name of the test and any reference to a test description
- <testParameters> (O). Refer to Para 2.4.2.1.3.
- <testProcedure> (O), the reference to test procedures or any relevant information

**Business rules decisions:**

- None identified

**Markup example:**

```
<faultIsolationTest testCode="O-001" testType="Operation">
<testDescr>
<testName>Test the bulbs</testName>
</testDescr>
```

```
<testParameters from="1" to="1" unitOfMeasure="Days"/>
<testProcedure>
<refs>
<dmRef xlink:actuate="onRequest" xlink:href="URN:S1000D:DMC-

<dmRefIdent>
<dmCode assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="341" infoCodeVariant="A" itemLocationCode="A"
modelIdentCode="S1000DLIGHTING" subSubSystemCode="0"
subSystemCode="0" systemCode="D00" systemDiffCode="AAA"/>
</dmRefIdent>
</dmRef>
</refs>
</testProcedure>
</faultIsolationTest>
```

*2.4.2.1.3 Test parameters*

**Description:** The element <`testParameters`> contains a set of attributes to capture parameters for the test.

**Markup element:** <`testParameters`> (O)

**Attributes:**

- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `from` (O), the start value for a range of values
- `to` (O), the end value for a range of values
- `unitOfMeasure` (O), the unite of measurement for the range

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

```
<testParameters from="1" to="1" unitOfMeasure="Days"/>
```

*2.4.2.1.4 Fault isolation test - SRU*

**Description:** The element <`sruItem`> contains the information needed to perform the test on the faulty SRU.

**Markup element:** <`sruItem` > (O)

ICN-3627-S1000D0511-001-01

*Fig 10 Element <sruItem>*

**Attributes:**

- id (O), the identifier of the <detectedLruItem> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- faultProbability (O), the probability factor to indicate the likelihood that this particular LRU is faulty
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <sru> (C). Refer to Para 2.4.1.3.4.
- <faultIsolationTest > (O). Refer to Para 2.4.2.1.2.
- <repair> (O). Refer to Para 2.4.1.4.1.
- <remarks> (O). Refer to Chap 3.9.5.1.

**Business rules decisions:**

- None identified

**Markup example:**

```
<sruItem>
<sru><name>Shop unit</name></sru>
</sruItem>
```

### 2.4.3 Observed faults

**Description:**The element <observedFault> contains information on observed faults but not detected by the computerized maintenance system.

The element has an attribute faultCode, which can be used to contain the fault code that is allocated as part of a logistic analysis process and an attribute faultType which can capture the type of fault.

**Markup element:** <observedFault> (O)

ICN-3627-S1000D0512-001-01

*Fig 11 Element <observedFault>*

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the <observedFault> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- faultCode (O), the fault code that is allocated as part of a logistic analysis process.
- faultType (O), the fault type that is allocated as part of a logistic analysis process.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.

**Child elements:**

- <faultDescr> (C), the description of the isolated fault. Refer to Para 2.4.1.1.
- <contextAndIsolationInfo> (C). Refer to Para 2.4.3.1.
- <remarks>. Refer to Chap 3.9.5.1.

**Business rules decisions:**

- None identified

**Markup example:**

```
<observedFault faultCode="NYCJD02" id="flt-0001">
<faultDescr>
<descr>The lights are set to the dim position.</descr>
</faultDescr>
<contextAndIsolationInfo>
<isolationInfo>
<lruItem>
<lru></lru>
</lruItem>
</isolationInfo>
</contextAndIsolationInfo>
</observedFault>
```

2.4.3.1 Context and isolation information

**Description:** The element <contextAndIsolationInfo> contains the description of the context in which the fault is observed and information needed to isolate the faulty item.

**Markup element:** <contextAndIsolationInfo> (C)

ICN-3627-S1000D0513-001-01

*Fig 12 Element <contextAndIsolationInfo>*

**Attributes:**

– None

**Child elements:**

– <faultContext> (O), the textual description of the context in which the fault is observed
– <isolationInfo> (C). Refer to Para 2.4.3.2.

**Business rules decisions:**

– None identified

**Markup example:**

```
<observedFault faultCode="NYCJD02" id="flt-0001">
<faultDescr>
<descr>The lights are set to the dim position.</descr>
</faultDescr>
<contextAndIsolationInfo>
<isolationInfo>
<lruItem>
<lru></lru>
</lruItem>
</isolationInfo>
</contextAndIsolationInfo>
</observedFault>
```

2.4.3.2 Fault isolation information

**Description:** The element <isolationInfo> contains the diagnostic information for the observed fault. This is done by referring out using the element <faultIsolationRef> or by describing a diagnostic process using the element <diagnosticProcess> or simply testing the LRU using the element <lruItem>.

**Markup element:** <isolationInfo> (O)

**Attributes:**

– None

**Child elements:**

- <faultIsolationRef> (O), the references to diagnostic information for the observed fault by using the element <refs>. Refer to Chap 3.9.5.2.1.2.
- <diagnosticProcess> (O). Refer to Para 2.4.3.3.
- <lruItem> (O). Refer to Para 2.4.2.1.1.

**Business rules decisions:**

- None identified

**Markup example:**

```
<isolationInfo>
<lruItem>
<lru></lru>
</lruItem>
</isolationInfo>
```

2.4.3.3 Diagnostics

**Description:** The element <diagnosticProcess> contains a textual description of the reason and a reference to a repair procedure or any locating and repairing tasks and information on the faulty LRU.

**Markup element:** <diagnosticProcess> (O)

ICN-3627-S1000D0514-001-01

*Fig 13 Element <diagnosticProcess>*

**Attributes:**

- None

**Child elements:**

- <diagnosticsReason> (O), the textual description of the of the cause of the failure.
- <repair> (O). Refer to Para 2.4.1.4.1.
- <locateAndRepairLruItem> (O). Refer to Para 2.4.1.4.

**Business rules decisions:**

- None identified

**Markup example:**

```
<diagnosticProcess>
<locateAndRepairLruItem>
<lru></lru>
</locateAndRepairLruItem>
</diagnosticProcess>
```

### 2.4.4 Correlated faults

**Description:** The element <correlatedFault> contains the information on correlated faults.

**Markup element:** <correlatedFault> (O)

ICN-3627-S1000D0515-001-01

*Fig 14 Element <correlatedFault>*

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the <correlatedFault> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <basicCorrelatedFault> (C), the correlated messages and warnings/malfunctions descriptions. Refer to Para 2.4.4.1.1.
- <isolateDetectedFault> (C), the fault information for the correlated fault isolation. Refer to Para 2.4.2.1.
- <remarks> (O). Refer to Chap 3.9.5.1.

**Business rules decisions:**

- None identified

**Markup example:**

```
<correlatedFault id="CFS0001">
<basicCorrelatedFaults>
<bitMessage><fault faultCode="100FC01"/>
<faultDescr>
<descr>The pedal mechanism is jammed</descr>
</faultDescr>
</bitMessage>
<bitMessage><fault faultCode="200FC01"/>
<faultDescr>
<descr>The derailleur is jammed</descr>
</faultDescr>
</bitMessage>
</basicCorrelatedFaults>
<isolateDetectedFault>
```

```
<lruItem>
<lru>
<name>Bicycle chain</name>
<identNumber>
<manufacturerCode>KZ120</manufacturerCode>
<partAndSerialNumber>
<partNumber>Tchain-120</partNumber>
</partAndSerialNumber>
</identNumber>
</lru>
</lruItem>
</isolateDetectedFault>
<remarks><simplePara>Prepare the derailleur to put transmission
chain back on pedal mechanism.</simplePara></remarks>
</correlatedFault>
```

*2.4.4.1.1 Messages and warnings*

**Description:** The element <basicCorrelatedFaults> contains the list of basic faults (messages and/or warnings) that have been correlated.

**Markup element:** <basicCorrelatedFaults> (C)

ICN-3627-S1000D0516-001-01

*Fig 15 Element <basicCorrelatedFault>*

**Attributes:**

- `id` (O), the identifier of the <`basicCorrelatedFault`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <`warningMalfunction`> (O). Refer to Para 2.4.4.1.2.
- <`assocWarningMalfunction`> (O). Refer to Para 2.4.4.1.3.
- <`bitMessage`> (O). Refer to Para 2.4.4.1.4.

**Business rules decisions:**

- None identified

**Markup example:**

```
<basicCorrelatedFaults>
<bitMessage><fault faultCode="100FC01"/>
<faultDescr>
<descr>The pedal mechanism is jammed</descr>
</faultDescr>
</bitMessage>
<bitMessage><fault faultCode="200FC01"/>
<faultDescr>
<descr>The derailleur is jammed</descr>
</faultDescr>
</bitMessage>
</basicCorrelatedFaults>
```

*2.4.4.1.2 Warning or malfunction*

**Description:** The basic fault (warning or malfunction) which is part of the current correlated fault.

**Markup element:** <`warningMalfunction`> (O)

ICN-3627-S1000D0517-001-01

*Fig 16 Element <`warningMalfunction`>*

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the <warningMalfunction> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- faultPartCategory (O), the category of the fault part of the correlation
- subCategory (O), the subcategory of the fault part of the correlation
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <fault> (C), the basic fault presented through the attribute faultCode
- <dmRef> (O), an optional reference to the data module where the unitary fault has been introduced, eg: a reference to a "detected fault list" data module. Refer to Chap 3.9.5.2.1.2.
- <faultDescr> (O). Refer to Para 2.4.1.1.
- <detectInfo> (O). Refer to Para 2.4.1.3.

**Business rules decisions:**

- None identified

**Markup example:**

```
<warningMalfunction>
<fault faultCode="100FC01"/>
</warningMalfunction>
```

2.4.4.1.3 *Associated warning or malfunction*

**Description:** The associated fault (warning or malfunction) which is part of the current correlated fault.

**Markup element:** <assocWarningMalfunction> (O)

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the <warningMalfunction> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- faultPartCategory (O), the category of the fault part of the correlation
- subCategory (O), the subcategory of the fault part of the correlation
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <fault> (C), the basic fault presented through the attribute faultCode

- <dmRef> (O), an optional reference to the data module where the unitary fault has been introduced, eg: a reference to a "detected fault list" data module. Refer to Chap 3.9.5.2.1.2.
- <faultDescr> (O). Refer to Para 2.4.1.1.
- <detectInfo> (O). Refer to Para 2.4.1.3.

**Business rules decisions:**

- None identified

**Markup example:**

```
<assocWarningMalfunction>
<fault faultCode="100FC01"/>
</assocWarningMalfunction>
```

*2.4.4.1.4 Computerized message from built-in test equipment*

**Description:** The basic fault (computerized message or warning/malfunction) which is part of the current correlated fault.

**Markup element:** <bitMessage> (O)

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the <warningMalfunction> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- faultPartCategory (O), the category of the fault part of the correlation
- subCategory (O), the subcategory of the fault part of the correlation
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <fault> (C), the basic fault presented through the attribute faultCode
- <dmRef> (O), an optional reference to the data module where the unitary fault has been introduced, eg: a reference to a "detected fault list" data module. Refer to Chap 3.9.5.2.1.2.
- <faultDescr> (O). Refer to Para 2.4.1.1.
- <detectInfo> (O). Refer to Para 2.4.1.3.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of correlation
- correlated fault messages and warnings
- population of detection and description information elements

**Markup example:**

```
<bitMessage><fault faultCode="100FC01"/>
<faultDescr>
<descr>The pedal mechanism is jammed</descr>
</faultDescr>
</bitMessage>
```

## 2.5 Fault isolation

**Description:** The fault isolation branch of the Schema identifies and describes the fault and gives the diagnostic path to isolate a faulty item.

**Markup element:** <faultIsolation> (O)

ICN-3627-S1000D0518-001-01

*Fig 17 Element <faultIsolation>*

**Attributes:**

- id (O), the identifier of the <faultIsolation> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <commonInfo> (O). Refer to Chap 3.9.5.2.1.12.
- <preliminaryRqmts> (O). Refer to Chap 3.9.5.2.1.9.
- <faultIsolationProcedure> (C), repeatable. Refer to Para 2.5.1.

**Business rules decisions:**

- None identified

**Markup example:**

```
<faultIsolation>
<faultIsolationProcedure>
<fault faultCode="NYCJD04"/>
<faultDescr><descr>Tire does not function correctly</descr>
</faultDescr>
<isolationProcedure>
<preliminaryRqmts><reqCondGroup><noConds/></reqCondGroup>

### 2.5.1 Fault isolation procedure

**Description:** The element <faultIsolationProcedure> contains the detailed fault isolation procedure including fault code, fault description.

**Markup element:** <faultIsolationProcedure> (C)

ICN-3627-S1000D0519-001-01

*Fig 18 Element <faultIsolationProcedure>*

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the <faultIsolationProcedure> element. Refer to Chap 3.9.5.2.1.2.

- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <`fault`>(O), the basic fault presented through the attribute `faultCode`.
- <`faultDescr`> (O). Refer to Para 2.4.1.1.
- <`isolationProcedure`> (C). Refer to Para 2.5.1.1.

**Business rules decisions:**

- None identified

2.5.1.1 Isolation procedure

**Description:** The element <isolationProcedure> contains the isolation procedure including preliminary requirements and closeup requirements.

**Markup element:** <isolationProcedure> (C)

**Attributes:**

- id (O), the identifier of the <isolationProcedure> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- independentCheck (O), the complete core procedure must be checked by a supervisor with a given qualification
- skillLevelCode (O), the skill level to which the procedure has been written. Refer to Chap 3.9.5.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <preliminaryRqmts>(C). Refer to Chap 3.9.5.2.1.9.
- <isolationMainProcedure> (C). Refer to Para 2.5.1.2.
- <closeRqmts> (C). Refer to Para 2.5.1.5. Refer to Chap 3.9.5.2.1.9 for details.

2.5.1.2 Main isolation procedure

**Description:** The element <isolationMainProcedure> contains the individual isolation steps.

**Markup element:** <isolationMainProcedure> (C)

ICN-3627-S1000D0520-001-01

*Fig 19 Element <isolationMainProcedure>*

**Attributes:**

– None

**Child elements:**

– <isolationStep> (C). Refer to Para 2.5.1.3.
– <isolationProcedureEnd> (C). Refer to Para 2.5.1.4.
– <figure> (O). Refer to Chap 3.9.5.2.1.7.
– <multimedia> (O). Refer to Chap 3.9.2.4.
– <foldout> (O). Refer to Chap 3.9.5.2.1.7.
– <table> (O). Refer to Chap 3.9.5.2.1.6.

**Business rules decisions:**

– None identified

**Markup example:**

```
<isolationMainProcedure>
<isolationStep id="stp-0001">
<action>Use the tire pressure gage (<internalRef
internalRefId="seq-0001"
internalRefTargetType="supequip"></internalRef> to do a check of
```

```
the pressure</action>
<isolationStepQuestion>What is the tire pressure
reading?</isolationStepQuestion>
<isolationStepAnswer>
<listOfChoices>
<choice nextActionRefId="stp-0002">More than 2700 hPa</choice>
<choice nextActionRefId="stp-0003">Between 100 hPA and 2700
hPa</choice>
<choice nextActionRefId="stp-0004">Less than 100 hPA</choice>
</listOfChoices>
</isolationStepAnswer>
</isolationStep>
<isolationProcedureEnd id="stp-0002">
<action>Deflate the tire until the pressureis 2700 hPa</action>
</isolationProcedureEnd>
<isolationProcedureEnd id="stp-0003">
<action>Inflate the tire as given in
<dmRef>
<dmRefIdent>

</dmRef>).</action>
</isolationProcedureEnd>
</isolationMainProcedure>
```

2.5.1.3 Fault isolation step

**Description:** The element <isolationStep> contains the textual description of the action, the question and answer alternatives. It can also include eg a title, warnings, cautions and note.

**Markup element:** <isolationStep> (O)

ICN-3627-S1000D0521-001-01

*Fig 20 Element <isolationStep>*

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the <isolationStep> element. Refer to Chap 3.9.5.2.1.2.
- warningRefs (O), the warning reference to the warnings and cautions collection. Refer to Chap 3.9.3.
- cautionRefs (O), the caution reference to the warnings and cautions collection. Refer to Chap 3.9.3.
- independentCheck (O), the isolation step must be checked by a supervisor with a given qualification
- keepWithNext (O), the indication whether a step should be presented together with the next step, if possible. This attribute is intended for use only when absolutely necessary in a situation where eg scrolling is not practical for the user or the viewing device does not allow scrolling. This attribute can have the following values:
  - "0" (D), (no)
  - "1", (yes) the step should be kept with the next sibling step (if one exists) and therefore, all children of the element for which the attribute is set should be kept together as well (if possible). This attribute has no meaning when placed on a final step.
- skillLevelCode (O), the skill level to which the procedure has been written. Refer to Chap 3.9.5.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.

**Child elements:**

- <title> (O). Refer to Para 2.5.1.3.1 for the use of titles. Refer to Chap 3.9.5.2.1.5 for general rules.
- <warning> (O). Refer to Chap 3.9.3.
- <caution> (O). Refer to Chap 3.9.3.
- <note> (O). Refer to Chap 3.9.3.
- <action> (O). Refer to Para 2.5.1.3.2.
- <figure> (O). Refer to Chap 3.9.5.2.1.7.
- <multimedia> (O). Refer to Chap 3.9.2.4.
- <foldout> (O). Refer to Chap 3.9.5.2.1.7.
- <table> (O). Refer to Chap 3.9.5.2.1.6.
- <isolationStepQuestion> (C), the textual question based on the corresponding action.
- <isolationStepAnswer> (C), the answers to the question. Refer to Para 2.5.1.3.3.

**Business rules decisions:**

- None identified

**Markup example:**

```
<isolationStep id="stp-0001">
<action>Use the tire pressure gage (<internalRef
internalRefId="seq-0001"
internalRefTargetType="supequip"></internalRef> to do a check of
the pressure</action>
<isolationStepQuestion>What is the tire pressure
reading?</isolationStepQuestion>
<isolationStepAnswer>
<listOfChoices>
<choice nextActionRefId="stp-0002">More than 2700 hPa</choice>
<choice nextActionRefId="stp-0003">Between 100 hPA and 2700
hPa</choice>
<choice nextActionRefId="stp-0004">Less than 100 hPA</choice>
</listOfChoices>
</isolationStepAnswer>
</isolationStep>
```

*2.5.1.3.1 Title*

**Description:** The element <title> contains the title of the step.

**Markup element:** <title> (O)

**Attributes:**

- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

The text elements used for the fault isolation element <action> can be used, refer to Para 2.5.1.3.2. Refer to Chap 3.9.5.2.1.10 for details.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– use of titles in fault isolation steps.

**Markup example:**

```
<title>Tire Pressure</title>
```

*2.5.1.3.2 Action*

**Description:** The element <action> contains an action in the isolation procedure.

**Markup element:** <action> (O)

ICN-3627-S1000D0522-001-01

*Fig 21 Element <action>*

**Attributes:**

- `id` (O), the identifier of the <`action`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

The text elements given in Fig 21 can be used. Refer to Chap 3.9.5.2.1.10.

**Business rules decisions:**

- None identified

**Markup example:**

```
<action>Use the tire pressure gage (<internalRef
internalRefId="seq-0001"
internalRefTargetType="supequip"></internalRef> to do a check of
the pressure</action>
```

*2.5.1.3.3 Answer*

**Description:** The element <`isolationStepAnswer`> contains the answers to the corresponding question (element <`isolationStepQuestion`>). The answers are given in the form of a reference to another action, to one or more final actions (in element <`isolationProcedureEnd`>) or to close-up requirements <`closeRqmts`>.

**Markup element:** <`isolationStepAnswer`> (C)

ICN-3627-S1000D0523-001-01

*Fig 22 Element <`isolationStepAnswer`>*

**Attributes:**

- `id` (O), the identifier of the <`isolationStepAnswer`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

– `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– <`yesNoAnswer`> (O). Refer to Para 2.5.1.3.4.
– <`listOfChoices`> (O). Refer to Para 2.5.1.3.5.

**Business rules decisions:**

– None identified

**Markup example:**

```
<isolationStepAnswer>
<listOfChoices>
<choice nextActionRefId="stp-0002">More than 2700 hPa</choice>
<choice nextActionRefId="stp-0003">Between 100 hPA and 2700
hPa</choice>
<choice nextActionRefId="stp-0004">Less than 100 hPA</choice>
</listOfChoices>
</isolationStepAnswer>
```

*2.5.1.3.4 Answers - Yes and no*

**Description:** The element <`yesNoAnswer`> contains the selection of the two answers: Yes (element <`yesAnswer`>) or No (element <`noAnswer`>). Each of these is giving a reference to another action, to the final action (in element <`isolationProcedureEnd`>) or to the close-up requirements (element <`closeRqmts`>).

**Markup element:** <`yesNoAnswer`> (C)

**Child elements:**

– <`yesAnswer`> (M). Action for a positive answer.
– <`noAnswer`> (M). Action for a negative answer.

**Attributes:**

The element <`yesAnswer`> (C) and the element <`noAnswer`> (C) have the attribute `nextActionRefId` containing the identifier for the next action.

**Business rules decisions:**

– None identified

**Markup example:**

```
<yesNoAnswer>
<yesAnswer nextActionRefId="istp-0005"/>
<noAnswer nextActionRefId="istp-0006"/>
</yesNoAnswer>
```

*2.5.1.3.5 Answers - Selection of choice*

**Description:** The element <`listOfChoices`> contains a selection of multiple (one or more) choices. Each of these is giving a reference to another action, to the final action (in element <`isolationProcedureEnd`>) or to close-up requirements (element <`closeRqmts`>).

**Markup element:** <`listOfChoices`> (C)

**Attributes:**

- `nextActionRefId` (M), contains the identifier of the next action for each of the element choices above.

**Child elements:**

- <`choice`> (M). List of possible choices.

**Business rules decisions:**

- None identified

**Markup example:**

```
<listOfChoices>
<choice nextActionRefId="stp-0002">More than 2700 hPa</choice>
<choice nextActionRefId="stp-0003">Between 100 hPA and 2700
hPa</choice>
<choice nextActionRefId="stp-0004">Less than 100 hPA</choice>
</listOfChoices>
```

2.5.1.4 Isolation procedure end

**Description:** The element <`isolationProcedureEnd`> contains further isolation actions (these are either within the data module or referenced out to another data module) or to the element <`closeRqmts`> containing a closeup procedure.

**Markup element:** <`isolationProcedureEnd`> (C)

**Attributes:**

- `applicRefId` (O), the applicability information. Refer to Chap 3.9.5.3.
- `id` (O), the identifier of the <`isolationProcedureEnd`> element. Refer to Chap 3.9.5.2.1.2.
- `independentCheck` (O), the isolation step must be checked by a supervisor with a given qualification
- `skillLevelCode` (O), the skill level to which the procedure has been written. Refer to Chap 3.9.5.1.
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.

**Child elements:**

The child elements are the same as in the element <`isolationStep`> except for <`isolationStepQuestion`> and the element <`isolationStepAnswer`>.

- <`title`> (O). Refer to Para 2.5.1.3.1 for the use of titles. Refer to Chap 3.9.5.2.1.5 for general rules.
- <`warning`> (O). Refer to Chap 3.9.3.
- <`caution`> (O). Refer to Chap 3.9.3.
- <`note`> (O). Refer to Chap 3.9.3.
- <`action`> (O). Refer to Para 2.5.1.3.2.
- <`figure`> (O). Refer to Chap 3.9.5.2.1.7.
- <`multimedia`> (O). Refer to Chap 3.9.2.4.
- <`foldout`> (O). Refer to Chap 3.9.5.2.1.7.
- <`table`> (O). Refer to Chap 3.9.5.2.1.6.

**Business rules decisions:**

– None identified

**Markup example:**

```
<isolationProcedureEnd id="stp-0002">
<action>Deflate the tire until the pressureis 2700 hPa</action>
</isolationProcedureEnd>
```

2.5.1.5 Close-up requirements

**Description:** The element <closeRqmts> contains any actions/conditions that must be in place before the equipment, which was the object of the procedure, is returned to operation. Refer to Chap 3.9.5.2.1.9.

**Markup element:** <closeRqmts> (C)

**Attributes:**

– id (O), the identifier of the <isolatedFault> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– <reqCondGroup> (M). Refer to Chap 3.9.5.2.1.9.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– inclusion of logistic data
– use of attribute skillLevelCode
– use of attribute independentCheck

**Markup example:**

```
<reqCondGroup><noConds/></reqCondGroup>
```

**2.5.2 Markup example**

```
<faultIsolation>
<faultIsolationProcedure>
<fault faultCode="NYCJD04"/>

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use of correlation**. The project or organization must decide whether to use the correlated fault concept or not. Refer to Para 2.4.4

**Correlated fault messages and warnings**. The project or organization must decide how to populate element <warningMalfunction>, element <assocWarningMalfunction> and element <bitMessage> when using the correlated fault concept. Refer to Para 2.4.4.1.4.

**Population of detection and description information elements**. The project or organization must decide whether the repetition of the detection and description information for the basic fault which has been correlated (element <faultDescr> and element <detectionInfo>) is used or not. Projects can consider that the detection and description information can eg be populated during IETP generation by picking up the information in the detected fault list data module describing the basic faults. Refer to Para 2.4.2.

**Use of titles in fault isolation steps**. The project or the organization must decide whether to use the element <title> or not and how to use it. Refer to Para 2.5.1.3.1.

**Inclusion of logistic data**. The project or organization must decide whether all isolation procedures should be kept in a single data module for an item or fault or whether to refer out to other data modules. Refer to Para 2.5.1.5.

**Use of attribute skillLevelCode**. The project or organization must decide whether to use the attribute skillLevelCode in the element <isolationProcedure>, the element <isolationStep> and the element <isolationProcedureEnd> or not. Refer to Para 2.5.1.5.

**Use of attribute `independentCheck`**. The project or organization must decide whether to use the attribute `independentCheck` in the element <`isolationProcedure`>, the element <`isolationStep`> and the element <`isolationProcedureEnd`> or not. Refer to Para 2.5.1.5.

# 1 General

The maintenance planning Schema must be used to contain maintenance planning information. The granularity of these data modules is determined by the application of the SNS in accordance with Chap 8.2.1 and the data module coding guidance given in Chap 5.2.1.6.

# 2 Maintenance planning information

## 2.1 Common Information

**Description:** The common information structure is in the content of the schema for maintenance planning data as a sibling to the maintenance planning information. Refer to Chap 3.9.5.2.1.12.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the element <`commonInfo`>

## 2.2 Maintenance planning

**Description:** Maintenance planning information is captured using the Content section of the four types of maintenance schedule data modules. These four types are time limits, which captures information about periodicities and life details for a system; task definitions, which captures the information about individual tasks to be carried out on a system, inspection definitions, which captures groups of maintenance tasks or inspection types, and maintenance allocation, which captures maintenance functions along with maintenance levels and time associated for each task.

ICN-S1000D-A-030905-D-F6117-25001-A-001-01

*Fig 1 Element <maintPlanning>*

**Markup element:** <maintPlanning> (M)

**Attributes:**

– maintPlanningType (O), a text string used to classify the maintenance planning data

**Business rules decisions:**

– None identified

**Child elements:**

– <inspectionDefinition> (O). Refer to Para 2.3.
– <taskDefinition> (O). Refer to Para 2.4.
– <timeLimitInfo> (O). Refer to Para 2.5.
– <maintAllocation> (O). Refer to Para 2.6.
– <toolsList> (O). Refer to Para 2.6.10.
– <remarksList> (O). Refer to Para 2.6.12.

**Markup example:**

```
<maintPlanning maintPlanningType="mpt01">
<timeLimitInfo timeLimitIdent="TL35">
...
</timeLimitInfo>
</maintPlanning>
```

## 2.3 Inspection definition

**Description:** This element contains information about inspections. Inspections are a way to group tasks that are related to the topic or intent of the inspection. This element groups a set of tasks with the limit information associated to perform the set of tasks.

**Markup element:** <inspectionDefinition> (O)

**Attributes:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– use of the optional element <inspectionDefinition>

**Child elements:**

– <inspection> (M), inspection information, refer to Para 2.3.1
– <taskGroup> (O), a list of tasks associated with the inspection, refer to Para 2.3.12

**Markup example:**

```
<inspectionDefinition>
<inspection>
...
</inspection>
<taskGroup>
...
</taskGroup>
</inspectionDefinition>
```

### 2.3.1 Inspection information

**Description:** The element <inspection> groups the inspection limit information with the associated remark information.

**Markup element:** <inspection> (M)

**Attributes:**

– id (O), the identifier of the <inspection> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Business rules decisions:**

– None identified

**Child elements:**

– <limit> (O), this element provides a structure that is designed to specify the interval between inspections, or the threshold before which an inspection must be performed. The limits can be associated with units of calendar time, number of events or with the occurrence of specific events. Refer to Para 2.3.2.
– <remarks> (O),this element contains text which gives further information about the inspection. Refer to Para 2.3.11

**Markup example:**

```
<inspection id="Preflight">
<limit>
...
</limit>
<remarks>
...
</remarks>
</inspection>
```

### 2.3.2 Limit information

**Description:** The element <`limit`> gives the information required to determine when a task must be performed.

ICN-S1000D-A-030905-D-F6117-25002-A-001-01

*Fig 2 Element <`limit`>*

**Markup element:** <`limit`> (O)

**Attributes:**

- `id` (O), the identifier of the <`limit`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `limitTypeValue` (O), this attribute is used to indicate the limit classification (it contains one of the following values. If no value is specified, the default value "`PE`" is implied.
  - "`PO`" = perform once
  - "`PE`" = perform periodically
  - "`OC`" = On condition

- `limitCond` (O), this attribute is used when attribute `limitTypeValue` contains the value "`OC`" to indicate the condition type of the limit when (ie maritime flight, dirty conditions)
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Business rules decisions:**

- None identified

**Child elements:**

- <`sampling`> (O). Refer to Para 2.3.3.
- <`threshold`> (O). Refer to Para 2.3.4.
- <`inspectionType`> (O). Refer to Para 2.3.6.
- <`trigger`> (O). Refer to Para 2.3.7.
- <`limitRange`> (O). Refer to Para 2.3.8.
- <`remarks`> (O). This element is used for text that gives further information about the limit. This element provides the means to convey comments on the limit information or descriptions of limits that cannot be represented with the available elements. For general use of the remarks element, refer to Para 2.3.11.

**Markup example:**

```
<limit limitTypeValue="po">
<sampling>10 Percent</sampling>
<limitRange>
...
</limitRange>
</limit>
```

### 2.3.3 Sampling

**Description:** This element <`sampling`> contains a description of a subset of the total number of Product instances on which the inspection must be performed. The sampling can be given as a percentage, a fraction or as a textual description. This element has only text content. This element must be omitted if the inspection must be performed on the full set of Products.

**Markup element:** <`sampling`> (O)

**Attributes:**

- None

**Business rules decisions:**

- None identified

**Child elements:**

- None

### 2.3.4 Threshold information

**Description:** The element <`threshold`> provides the ability to describe limit information in terms of a value before which the inspection must be performed. The value can be given in calendar time or in other terms such as the number of hours a Product has been operating.

**Markup element:** <`threshold`> (O)

**Attributes:**

- `thresholdUnitOfMeasure` (M). This attribute gives the dimensional units in which to interpret the threshold values. The unit values are given as codes patterned as "`th`" plus two digits, and the meaning of these values are given in Chap 3.9.6.
- `thresholdType` (O). This attribute contains the value "`threshold`" or "`interval`", and it specifies the starting point of the threshold. It can be "from the beginning" of the maintenance program or from "the last time the inspection was performed."

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- units of measure for threshold information
- values for the attribute `thresholdType`

**Child elements:**

- <`thresholdValue`> (M). This element gives a value before which the inspection must be performed. This element has only text content. Refer to Para 2.3.4
- <`tolerance`> (O). This element gives values that can be used to expand the threshold value into a range of acceptable values. Refer to Para 2.3.5.

**Markup example:**

```
<threshold thresholdUnitOfMeasure="th01">
<thresholdValue>10</thresholdValue>
</threshold>
```

### 2.3.5 Tolerance information

**Description:** The element <`tolerance`> allows the threshold to be given as minimum and maximum value between which the inspection must be performed. The minimum value is determined by subtracting the value of `toleranceLow` from the value of the threshold. The maximum value is determined by adding the value of `toleranceHigh` to the value of the threshold.

**Markup element:** <`tolerance`> (M)

**Attributes:**

- `toleranceLow` (O), this attribute gives the negative threshold value tolerance (- n)
- `toleranceHigh` (O), this attribute gives the positive threshold value tolerance (+ n)

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

```
<tolerance toleranceLow="2" toleranceHigh="3"/>
```

### 2.3.6 Inspection type

**Description:** The element <`inspectionType`> provides a classification of maintenance into various types such as "systems", "structural" and "zonal".

**Markup element:** <`inspectionType`> (M)

**Attributes:**

- `id` (O), the identifier of the <`inspectionType`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `inspectionTypeCategory` (M), this attribute contains a text string that is used to classify the inspection, when limit is used at the task level, this attribute would allow the author to refer to the inspection `id`
- `toleranceHigh` (O), the positive threshold value tolerance (+ n)
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- values for the inspection types

**Child elements:**

- None

**Markup example:**

```
<inspectionType inspectionTypeCategory="Preflight" />
```

### 2.3.7 Trigger

**Description:** The element <`trigger`> provides the means to establish that the inspection must be performed after a certain event.

**Markup element:** <`trigger`> (M)

**Attributes:**

- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `releaseEvent` (O), a description of the release event causing the triggering of an inspection

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- values of the attribute `releaseEvent`

**Child elements:**

- <`refs`> (O). This element is used to indicate any tasks that must be performed before the inspection. Refer to Chap 3.9.5.2.1.2
- <`threshold`> (O), this element indicates that the Inspection must be performed after some threshold value has been reached. Refer to Para 2.3.4.

**Markup example:**

```
<trigger releaseEvent="after" >
<threshold thresholdUnitOfMeasure="th01">
...
</threshold>
</trigger>
```

### 2.3.8 Limit range

**Description:** The element <limitRange> provides the means to establish that the inspection must be performed between two values.

**Markup element:** <limitRange> (M)

**Attributes:**

– None

**Business rules decisions:**

– None identified

**Child elements:**

– <limitRangeFrom> (M), the inspection must be performed after this range has been reached. Refer to Para 2.3.9.
– <limitRangeTo> (O), the Inspection must be performed before this range has been reached. Refer to Para 2.3.10.

**Markup example:**

```
<limitRange>
<limitRangeFrom>
...
</limitRangeFrom>
<limitRangeTo>
...
</limitRangeTo>
</limitRange>
```

### 2.3.9 Limit range start

**Description:** The element <limitRangeFrom> provides the means to establish the starting limit for a limit range between which the inspection must be performed.

**Markup element:** <limitRangeFrom> (M)

**Attributes:**

– None

**Business rules decisions:**

– None identified

**Child elements:**

– <threshold> (M). The inspection must be performed after some threshold value has been reached. Refer to Para 2.3.4.

**Markup example:**

```
<limitRangeFrom>
<threshold thresholdUnitOfMeasure="th01">
...
</threshold>
</limitRangeFrom>
```

### 2.3.10 Limit range end

**Description:** The element <limitRangeTo> provides the means to establish the ending limit for a limit range between which the inspection must be performed.

**Markup element:** <limitRangeTo> (O)

**Attributes:**

– None

**Business rules decisions:**

– None identified

**Child elements:**

– <threshold> (M). The inspection must be performed after some threshold value has been reached. Refer to Para 2.3.4.

**Markup example:**

```
<limitRangeTo>
<threshold thresholdUnitOfMeasure="th01">
...
</threshold>
</limitRangeTo>
```

### 2.3.11 Remarks

**Description:** The element <remarks> represents textual comments related to the containing element.

**Markup element:** <remarks> (O)

**Attributes:**

– applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.

**Business rules decisions:**

– None identified

**Child elements:**

– <simplePara> (M). This element provides a restricted form paragraph which can only contain the elements <subScript> and <superScript>. Refer to Chap 3.9.5.2.1.10.

**Markup example:**

```
<remarks>
<simplePara>Here is some text</simplePara>
</remarks>
```

### 2.3.12 Task group

**Description:** The element <taskGroup> represents a list of tasks that belong to the inspection. This element facilitates production of a table of tasks in an inspection.

**Markup element:** <taskGroup> (O)

**Attributes:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– which tasks belong to which groups

**Child elements:**

– <taskItem> (M), an individual task in an inspection. Refer to Para 2.3.13.

**Markup example:**

```
<taskGroup>
<taskItem taskSeqNumber="001" taskName="Nose Landing Gear
Inspection">
...
</taskItem>
</taskGroup>
```

### 2.3.13 Task item

**Description:** The element <taskItem> represents an individual task that belongs to an inspection.

**Markup element:** <taskItem> (M)

**Attributes:**

– applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
– id (O), the identifier of the <taskItem> element. Refer to Chap 3.9.5.2.1.2.
– taskSeqNumber (M), this attribute contains the ordinal position of the task within the inspection tasks group
– taskName (M), this attribute contains the textual identifier of the task
– skillLevelCode (O), this attribute contains the competency level required of the person who will perform the task. The values that can be specified for this attribute are defined in Chap 3.9.6.
– authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– how to sequence the tasks
– values and definitions of the skill level code

**Child elements:**

– <refs> (O), this element is used to make reference to data modules for the task. The intent is to refer to a task instance in the element <taskDefinition>. For a

description of the task definition structure, refer to Para 2.3.14. For a description of the reference structure, refer to Chap 3.9.5.2.1.2.

– <task> (O), this element contains a set of information that describes the task. Refer to Para 2.3.14.

**Markup example:**

```
<taskItem taskSeqNumber="001" taskName="Nose Landing Gear
Inspection">
<refs>
...
</refs>
<task>
...
</task>
</taskItem>
```

### 2.3.14 Task

**Description:** The element <task> has general data for a task that belongs to an inspection.

**Markup element:** <task> (O)

**Attributes:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– values for the attribute, markerType, of the <taskMarker> element

**Child elements:**

– <taskTitle> (O), this element contains a short textual description of the task.
– <taskDescr> (M), this element contains a fuller textual description of the task.
– <taskMarker> (O), this element contains no content and a single attribute, markerType, that indicates the nature of the data in the <taskDescr> element. This element can be used to separate an aggregation of text that came from regulatory sources into discretely classified textual items. The value of the attribute markerType can be used to indicate whether the task is performed internal or external to the product.

**Markup example:**

```
<taskItem taskSeqNumber="001" taskName="Nose Landing Gear
Inspection">
<task>
<taskTitle>
General Visual Inspection of the Landing Gear
</taskTitle>
<taskDescr>
This inspection of the landing gear covers all aspects including
wiring...
</taskDescr>
<taskMarker markerType="location"/>
</task>
</taskItem>
```

## 2.4 Task definition

**Description:** The element <taskDefinition> contains the task information necessary to schedule maintenance.

ICN-S1000D-A-030905-D-F6117-25003-A-001-01

*Fig 3 Element <taskDefinition>*

**Markup element:** <taskDefinition> (M) Mandatory for the task definition branch of the maintenance planning element.

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the <taskDefinition> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- taskIdent (M), this attribute contains a unique identifier for the list of tasks.
- taskCode (O), this attribute provides a mechanism to categorize the task. For example, a general visual inspection is a common category. The valid pattern for this attribute is "taskcd" plus two digits. Several task code values are defined in Chap 3.9.6.1. The project or the organization must decide additional definitions.
- worthinessLimit (O), this attribute signifies whether the task is subject to worthiness limitations. It indicates whether the performance of the tasks is mandatory or recommended.

- `reducedMaint` (O), this attribute indicates that values in the task represent a reduction in the maintenance requirements as compared to the original task.
- `skillLevelCode` (O), a code that indicated the competency level required of the person performing the task. The values that can be specified for this attribute are defined in Chap 3.9.6.
- `skillType` (O), this attribute provides a classification of the main technical ability required of the person performing the task (eg "Airframe", "Electrical", "Avionic", "Engine") and must be populated as described in Chap 3.9.6.1.
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <`task`> (M), this element groups information used to describe the task, refer to Para 2.3.14.
- <`rqmtSource`>(O), this element identifies the authority that established the requirement to do the task. Refer to Para 2.4.1.
- <`preliminaryRqmts`>(O). This element provides a grouping of information about resources that are required before the task can be performed. Refer to Chap 3.9.5.2.1.9.
- <`refs`>(O), this element is used to refer to data modules or other publications that represent the accomplishment instructions for the task. For a description of the reference structure, refer to Chap 3.9.5.2.1.2.
- <`equipGroup`> (O), this element provides a grouping of information used to describe equipment that is the subject of, used in or associated to the task. Refer to Para 2.4.4.
- <`name`> (O), this element can be used instead of element <`equipGroup`> for structural and other items that do not have part numbers. Refer to Para 2.4.6.
- <`supervisorLevel`> (O), this element is used to indicate the level of supervision that is appropriate for the task. It has a single attribute `supervisorLevelCode` (O). Refer to Para 2.4.7.
- <`limit`> (O), this element gives the information required to determine when a task must be performed. Refer to Para 2.3.2.
- <`remarks`> (O), this element contains text giving further information about the inspection. Refer to Para 2.3.11.
- <`relatedTask`> (O), this element is used to provide a relationship between two tasks. It has an attribute `taskIdent` that is used to refer to the `taskIdent` of the related task. It has another attribute `relatedTaskDescr` that is used to describe the relationship. Refer to Para 2.4.8.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- definitions for the `taskCode` attribute values
- use of the attribute `worthinessLimit`
- use of the attribute `reducedMaint`
- use of the attribute `skillLevelCode` and definitions for the skill levels
- use of and values for the attribute `skillType`

**Markup example:**

```
<taskDefinition taskIdent="31-010-01" taskCode="taskcd01">
<task>
```

```
...
</task>
<relatedTask taskIdent="23-050-02" relatedTaskDescr="A" />
</taskDefinition>
```

### 2.4.1 Requirement source

**Description:** The element <rqmtSource> gives information to enable identification of the authority that is the source of the maintenance requirement.

**Markup element:** <rqmtSource> (O)

**Attributes:**

- sourceOfRqmt (M), this attribute contains a code that indicates the origination of the requirement (eg "MSG3", "CMR" and "AD")
- sourceIdent (O), this attribute contains the document number of the source of requirement or the title of the source if no document number is available.
- approval (O), this attribute gives the level of approval of the source.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- values for the attribute sourceOfRqmt
- values for the attribute approval

**Child elements:**

- <issueInfo> (O). Refer to Chap 3.9.5.1.
- <issueDate> (O). Refer to Chap 3.9.5.1.
- <sourceType> (O), this attribute has information that classifies the source of the requirement. This gives the ability to include requirements such as failure effect category, failure effect code, Enhanced Zonal Analysis Program (EZAP), Lightning or High Intensity Radiated Field (L/HIRF), CMR 1 star, CMR 2 star, and future regulatory sources. Refer to Para 2.4.2.

**Markup example:**

```
<rqmtSource sourceOfRqmt="MRB" />
```

### 2.4.2 Source type

**Description:** This element <sourceType> provides a means to classify the source of the requirement.

**Markup element:** <sourceType> (O)

**Attributes:**

- sourceCriticality (M), this attribute is a four character value with the pattern of "sc" plus two digits that indicates the impact of not complying with the requirement (refer to Chap 3.9.6.1 for the list of values). It is also called the failure effect category. As an example, the values for civil air given by: "sc5" = "Evident, safety", "sc6" = "Evident, Operational", "sc7" = "Evident, Economic", "sc8" = "Hidden, Safety", "sc9" = "Hidden, Non-Safety" and an empty string indicates "not coming from MSG3.
- sourceTypeCode (M), a five character value with the pattern of "stc" plus two digits that indicates the type of source

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- values for the attribute `sourceCriticality`
- values for the attribute `sourceTypeCode`

**Child elements:**

- None

**Markup example:**

```
<sourceType sourceCriticality="sc01" sourceTypeCode="stc01"/>
```

### 2.4.3 Preliminary requirements

**Description:** The element <`preliminaryRqmts`> groups together all information about resources that can be required before the accomplishment of the task. The structure of this element is described in Chap 3.9.5.2.1.9.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of the element <`preliminaryRqmts`>

### 2.4.4 Equipment group

**Description:** The element <`equipGroup`> provides a means to identify the equipments associated with the task.

**Markup element:** <`equipGroup`> (O)

**Attributes:**

- `id` (O), the identifier of the <`equipGroup`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <`equip`> (M), this element provides a means to identify an individual piece of equipment associated with the task. Refer to Para 2.4.5.

**Business rules decisions:**

- None identified

**Markup example:**

```
<equipGroup>
<equip>
...
</equip>
</equipGroup>
```

### 2.4.5 Equipment

**Description:** The element <equip> provides a means to identify an individual piece of equipment associated with the task.

**Markup element:** <equip> (M)

**Attributes:**

- id (O), the identifier of the <equip> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <name> (M), this element contains a short textual identifier of the equipment. Refer to Para 2.4.6.
- <natoStockNumber> (O). Refer to Chap 3.9.5.2.7.
- <identNumber> (O). Refer to Chap 3.9.5.2.1.9.
- <catalogSeqNumberRef> (O). Refer to Chap 3.9.5.2.7.

**Business rules decisions:**

- None identified

**Markup example:**

```
<equip>
<name>Flight Data Recorder</name>
...
</equip>
```

### 2.4.6 Equipment name

**Description:** The element <name> contains the textual name of the equipment.

**Markup element:** <name> (M)

**Attributes:**

- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- whether a terminology database is to be used

**Child elements:**

- None

**Markup example:**

```
<name>Flight Data Recorder</name>
```

### 2.4.7 Supervisor level

**Description:** The element <supervisorLevel> contains the hierarchical level in the supervisory structure that explain if the supervisor must observe the task or inspect the results of the task.

**Markup element:** <supervisorLevel> (M)

**Attributes:**

- id (O), the identifier of the <supervisorLevel> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- supervisorLevelCode (O), identifies if either the supervisor must observe the task or inspect the results of the task.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- codes for the attribute supervisorLevelCode

**Child elements:**

- None

**Markup example:**

```
<supervisorLevel supervisorLevelCode="sl01"/>
```

### 2.4.8 Related task

**Description:** The attributes of this element identify another task that has an association to the current task and provide a code that indicates the nature of the association.

**Markup element:** <relatedTask> (O)

**Attributes:**

- taskIdent (M), identifies the task that has an association to the current task
- relatedTaskDescr (M), indicates the nature of the association
  - "after" the current task must be performed after the related task
  - "before" the current task must be performed before the related task
  - "complied" performing the current task complies with the requirements of the related task
  - "finished" the current task must be finished before the related task can be finished.
  - "precludes" the current task satisfies the intent of the related task
  - "started" the current task must be started before the related task
  - "with" the current task and the related task must be performed together

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

```
<relatedTask taskIdent="31-010-01" relatedTaskDescr="before" />
```

### 2.4.9 NATO stock number

**Description:** The element <natoStockNumber> contains an identifier for the equipment that follows the coding system determined by NATO, and Ministries or Departments of Defense. Refer to Chap 3.9.5.2.7.

### 2.4.10 Identification number

**Description:** This element <identNumber> contains an identifier for the equipment associated with the task. Refer to Chap 3.9.5.2.1.9.

### 2.4.11 Manufacturer code

**Description:** The element <manufacturerCode> contains an identifier for the manufacturer of the equipment. Refer to Chap 3.9.5.2.1.9.

### 2.4.12 Part and serial number

**Description:** The element <partAndSerialNumber> groups the serial number of an item of equipment with its part number. The structure allows multiple serial numbers to be associated to a part number. Refer to Chap 3.9.5.2.1.9.

### 2.4.13 Part number

**Description:** The element <partNumber> has the part number of the equipment associated with the task. Refer to Chap 3.9.5.2.1.9.

### 2.4.14 Serial number

**Description:** The element <serialNumber> has the serial number of the equipment associated with the task. A serial number uniquely identifies a physical part in the set of parts with a given part number. Refer to Chap 3.9.5.2.1.9.

### 2.4.15 Catalog sequence number reference

**Description:** The element <catalogSeqNumberRef> provides a reference to the IPD CSN that corresponds to the equipment. Refer to Chap 3.9.5.2.7.

## 2.5 Time limit information

**Description:** The element <timeLimitInfo> is used to contain time limit, periodicities and life details information relating to equipments or systems.

ICN-S1000D-A-030905-D-F6117-25004-A-001-01

*Fig 4 Element <timeLimitInfo>*

**Markup element:** <timeLimitInfo> (O)

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- timeLimitIdent (M), this attribute gives the identifier of the <timeLimit> element.
- skillLevelCode (O), this attribute gives the competency level required of the person who will perform the task

**Business Rules Decisions:**

Business rules decisions include, but are not limited to, the following:

- values of the competency level codes

**Child elements:**

- <equipGroup> (M), this element provides a grouping of information used to describe equipment that is subject to the time limit. Refer to Para 2.4.4.
- <reqQuantity> (O), this element contains details about the quantity of items of equipment subject to the time limit. Refer to Para 2.5.1.
- <timeLimitCategory> (O), this element provides a means to classify the time limits. Refer to Para 2.5.2.
- <timeLimit> (M), this element contains information describing when a piece of equipment must be removed from service or storage. Refer to Para 2.5.3.

**Markup example:**

```
<timeLimitInfo timeLimitIdent="TL35">
<equipGroup>
...
</equipGroup>
<timeLimit>
...
</timeLimit>
</timeLimitInfo>
```

### 2.5.1 Required quantity

**Description:** The element <reqQuantity> contains the number of equipment items that are subject to the time limit in the scope of the Product.

**Markup element:** <reqQuantity> (O)

**Attributes:**

- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- unitOfMeasure (M), a text string giving the fundamental subdivision along the dimension to which the quantity applies. It can also give a name for a container of items (eg "cases" as in "five cases").

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

```
<reqQuantity unitOfMeasure="boxes">6</reqQuantity>
```

### 2.5.2 Time limit category

**Description:** The element <timeLimitCategory> is used to classify the time limit.

**Markup element:** <timeLimitCategory> (O)

**Attributes:**

- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- timeLimitCategoryValue (M), an enumeration representing the categories of time limits. Valid values are "1" and "2". These values can represent categories such as "safety related" or "non-safety related".

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of the element <timeLimitCategory>

**Child elements:**

- None

**Markup example:**

```
<timeLimitCategory timeLimitCategoryValue="1"/>
```

### 2.5.3 Time limit

**Description:** The element <timeLimit> is used to express the time limits.

**Markup element:** <timeLimit> (M)

**Attributes:**

- None

**Child elements:**

- <limitType> (M), this element contains information expressing the time limit. Refer to Para 2.5.4.
- <remarks> (O), this element contains textual comments to supplement the structured limit information. Refer to Para 2.3.10.

**Business rules decisions:**

- None identified

**Markup example:**

```
<timeLimit>
<limitType>
...
</limitType>
</timeLimit>
```

### 2.5.4 Limit type

**Description:** The element <limitType> is used to express the threshold values and units of the time limit.

**Markup element:** <limitType> (M)

**Attributes:**

- id (O), the identifier of the <limitType> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- limitUnitType (M), this element contains an enumeration representing the dimensional unit for the given time limit values. Valid values have the pattern "lt" plus two digits, and these are given in Chap 3.9.6.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Values for the attribute limitUnitType.

**Child elements:**

- <threshold> (M), this element contains information expressing the time limit. Refer to Para 2.3.4
- <remarks> (M), textual comments to supplement the structured limit information. Refer to Para 2.3.11.

**Markup example:**

```
<limitType limitUnitType="lt01">
<threshold thresholdUnitOfMeasure="th01">
...
</threshold>
</limitType>
```

## 2.6 Maintenance allocation

**Description:** The element <maintAllocation> contains information about maintenance allocations. Maintenance allocations capture maintenance functions along with maintenance levels and time associated for each task. It is contained in the element <maintPlanning> (refer to Para 2.2).

The maintenance allocation designates the overall authority and the responsibility for the performance of maintenance functions on the identified end item or component. The data lists maintenance functions along with maintenance levels, and the time associated for each task. These maintenance functions can also be grouped together. All the information required to build the maintenance allocation is included in the Logistics Support Analysis Record (LSAR). The element <toolsList> and the element <remarksList> are used to provide a list of tools and remarks for referencing purposes.

**Markup element:** <maintAllocation> (O)

**Attributes:**

– None

**Business rules decisions:**

– None identified

**Child elements:**

– <title> (M), this element contains the title which describes the maintenance allocation. Refer to Chap 3.9.5.2.1.5.
– <maintAllocationGroup> (M), this element is used to group functional items together. Refer to Para 2.6.1.

Sibling elements:

– <toolsList> (O), this element contains a list of tools for referencing purposes. Refer to Para 2.6.10.
– <remarksList> (O), this element contains a list of remarks. Refer to Para 2.6.12.

**Markup example:**

```
<maintPlanning>
<maintAllocation>
...
</maintAllocation>
<toolsList>
...
</toolsList>
</maintPlanning>
```

### 2.6.1 Maintenance allocation group

**Description:** The element <maintAllocationGroup> is used to group maintenance functional items together.

ICN-S1000D-A-030905-D-F6117-25005-A-001-01

*Fig 5 Element <maintAllocationGroup>*

**Markup element:** <maintAllocationGroup> (M)

**Attributes:**

- id (O), the identifier of the <maintAllocationGroup> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- skillLevelCode (O), the competency level required of the person who will perform the task.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <groupNumber> (M), this element is used to capture the functional item group of the end item. The functional group applies to repairable assemblies and subassemblies, ie spares (any repairable component required for the maintenance or repair of an end item), but not to repair parts (any consumable, non-repairable component required for the maintenance or repair of an end item). Refer to Para 2.6.2.
- <componentAssy> (M), this element is used to identify the item name or nomenclature (a basic name and a noun word or phrase modifier, eg transformer) and must be marked up using the element <name>. Parts that are not subject to maintenance must not be listed. Refer to Para 2.6.3.
- <maintQualifier> (M), this element is used to capture maintenance action qualification such as maintenance function, maintenance level estimated work time, any tools and/or test equipment and any remarks. Refer to Para 2.6.4.
- <componentAssyGroup> (M), this element is used when there is a requirement to subdivide the list into subassemblies. Refer to Para 2.6.9.

**Business rules decisions:**

- None identified

**Markup example:**

```
<maintAllocationGroup>
<groupNumber>
```

```
...
</groupNumber>
<componentAssy>
...
</componentAssy>
<maintQualifier>
...
</maintQualifier>
</maintAllocationGroup>
```

### 2.6.2 Maintenance allocation group number

**Description:** The element <groupNumber> is used to capture the functional item group of the end item. The functional group applies to repairable assemblies and subassemblies, ie spares (any repairable component required for the maintenance or repair of an end item), but not to repair parts (any consumable, non-repairable component required for the maintenance or repair of an end item).

**Markup element:** <groupNumber> (M)

**Attributes:**

- id (O), the identifier of the <groupNumber> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- skillLevelCode (O), this attribute contains the competency level required of the person who will perform the task. The values that can be specified for this attribute are defined in Chap 3.9.6.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

```
<groupNumber>0401</groupNumber>
```

### 2.6.3 Component assembly

**Description:** The element <componentAssy> is used to identify the item name or nomenclature (a basic name and a noun word or phrase modifier, eg transformer) and must be marked up using the element <name>. Parts that are not subject to maintenance must not be listed.

**Markup element:** <componentAssy> (M)

**Attributes:**

- None

**Child elements:**

- <name> (M), this element contains the name or nomenclature of the item, refer to Para 2.4.6.
- <typeDesignation> (O), this element contains a text string used to give further information about the component assembly. The element has no attributes.

**Business rules decisions:**

- None identified

**Markup example:**

```
<componentAssy>
<name>Flight Data Recorder</name>
<typeDesignation>
Here is some text.
</typeDesignation>
</componentAssy>
```

### 2.6.4 Maintenance qualifier

**Description:** The element <maintQualifier> is used to capture maintenance action qualification such as maintenance function, maintenance level estimated work time, any tools and/or test equipment and any remarks.

**Markup element:** <maintQualifier> (M)

**Attributes:**

- None

**Child elements:**

- <maintFunction> (M), this element includes the maintenance function to be performed on the item listed (eg inspect, test, service,..). The maintenance function is entered by specifying an enumerated value using the attribute function. Specific values are given in Chap 3.9.6.1.
- <maintLevelGroup> (M), this element is used to gather the information about the lowest authorized maintenance level and the associated estimated work time to perform the maintenance. The maintenance level is specified by selecting an enumerated value for the attribute maintLevelCode (refer to Chap 3.9.6.1). The enumerated values can be specified by project decision and can be defined for maintenance levels such as crew, operator, organization, direct, general support, or depot. The estimated work time should be entered as a data string within the element <maintLevel>. Refer to Para 2.6.5.
- <toolsRefs> (O), this element is used to contain a reference to a required tool or test equipment that is contained in the tools list within the maintenance allocation data. The element <internalRef> is allowed inside <toolsRefs> and is repeatable to allow for referencing multiple tools (refer to Chap 3.9.5.2.1.2). Refer to Para 2.6.7.
- <remarksRefs> (O), this element is used to contain a reference to remarks contained in the remarks list within the maintenance allocation data. The element <internalRef> is allowed inside element <remarksRefs> and is repeatable to allow for referencing multiple remarks (refer to Chap 3.9.5.2.1.2). Refer to Para 2.6.8.

**Business rules decisions:**

- None identified

**Markup example:**

```
<maintQualifier>
<maintFunction function="ft00"/>
<maintLevelGroup>
...
</maintLevelGroup>
</maintQualifier>
```

### 2.6.5 Maintenance level group

**Description:** This element is used to gather the information about the lowest authorized maintenance level and the associated estimated work time to perform the maintenance. <`maintLevel`>.

**Markup element:** <`maintLevelGroup`> (M)

**Attributes:**

– None

**Child elements:**

– <`maintLevel`> (M), The maintenance level is specified by selecting an enumerated value for the attribute `maintLevelCode`. The enumerated values can be specified by project decision and can be defined for maintenance levels such as crew, operator, organization, direct, general support, or depot. The estimated work time can be entered as a data string within the element. Refer to Para 2.6.6.

**Business rules decisions:**

– None identified

**Markup example:**

```
<maintLevelGroup>
<maintLevel maintLevelCode="ml01">
...
</maintLevel>
</maintLevelGroup>
```

### 2.6.6 Maintenance level

**Description:** The maintenance level is specified by selecting an enumerated value for the attribute `maintLevelCode`. The estimated work time can be entered as a data string within the element.

**Markup element:** <`maintLevel`> (M)

**Attributes:**

– `maintLevelCode` (O), Contains enumerated values specified by project decision and can be defined for maintenance levels such as crew, operator, organization, direct, general support, or depot. Refer to Chap 3.9.6.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– values for the attribute `maintLevelCode`

**Child elements:**

– None

**Markup example:**

```
<maintLevel maintLevelCode="ml01"/>
```

### 2.6.7 Tools References

**Description:** The element <toolsRefs> is used to contain a reference to a required tool or test equipment that is contained in the tools list within the maintenance allocation data.

**Markup element:** <toolsRefs> (O)

**Attributes:**

– None

**Child elements:**

– <internalRef> (M), This element provides the mechanism to reference multiple tools. Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

– None identified

**Markup example:**

```
<toolsRefs>
<internalRef internalRefId="tool-001"
internalRefTargetType="other">
...
</internalRef>
</toolsRefs>
```

### 2.6.8 Remarks References

**Description:** The element <remarksRefs> is used to contain a reference to remarks contained in the remarks list within the maintenance allocation data.

**Markup element:** <remarksRefs> (O)

**Attributes:**

– None

**Child elements:**

– <internalRef> (M), This element provides the mechanism to reference multiple remarks. Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

– None identified

**Markup example:**

```
<remarksRefs>
<internalRef internalRefId="rem-001"
internalRefTargetType="other">
...
```

```
</internalRef>
</remarksRefs>
```

### 2.6.9 Component Assembly Group

**Description:** The element <`componentAssyGroup`> is used when there is a requirement to subdivide the list into subassemblies.

**Markup element:** <`componentAssyGroup`> (O)

**Attributes:**

– None

**Child elements:**

– <`componentAssy`> (M). Refer to Para 2.6.3.
– <`maintQualifier`> (M). Refer to Para 2.6.4.

**Business rules decisions:**

– None identified

**Markup example:**

```
<componentAssyGroup>
<componentAssy>
...
</componentAssy>
<maintQualifier>
...
</maintQualifier>
</componentAssyGroup>
```

### 2.6.10 Tools list

**Description:** The element <`toolsList`> is used to list both special and common tools and test equipment required to maintain the equipment as indicated in the maintenance allocation. When tools and test equipment are indicated in the maintenance allocation, the tools list must be included. The tools list includes a required element <`title`> and a required and repeatable element <`toolsListGroup`>.

**Markup element:** <`toolsList`> (O)

**Attributes:**

– `id` (O), the identifier of the <`toolsList`> element. Refer to Chap 3.9.5.2.1.2.
– `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– `skillLevelCode` (O), the competency level required of the person who will perform the task.
– `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– <`title`> (M), this element is used to capture the tools and test equipment list title. It is populated in accordance with Chap 3.9.5.2.1.5.

– <toolsListGroup> (M), this element is used to capture data about the tool or test equipment. It includes elements for tools list code, maintenance, nomenclature, NSN, and tool number. Refer to Para 2.6.11.

**Business rules decisions:**

– None identified

**Markup example:**

```
<toolsList>
<title>List of tools</title>
<toolsListGroup>
...
</toolsListGroup>
</toolsList>
```

### 2.6.11 Tools list group

**Description:** The element <toolsListGroup> is used to capture data about the tool or test equipment. It includes elements for tools list code, maintenance, nomenclature, NSN, and tool number.

**Markup element:** <toolsListGroup> (M)

**Attributes:**

– None

**Child elements:**

– <toolsListCode> (M), this element is used to provide an id for the purposes of cross referencing. The element also allows for string data in the event that a particular code such as "A", "B", or "C" is used to identify the tool in the maintenance allocation data.
– <maintLevel> (M), this element is used to capture the lowest authorized maintenance level. The enumerated attribute maintLevelCode is used to identify the level. Refer to Para 2.6.6
– <name> (M), this element is used to identify the tool or test equipment. A basic name or noun should be used. Refer to Para 2.4.6.
– <natoStockNumber> (M), this element provides an identifier for the equipment that follows the coding system determined by NATO, and Ministries or Departments of Defense. Refer to Para 2.4.9.
– <toolRef> (M), this element is used to indicate the tool number. The tool number is entered via the attribute toolNumber. Refer to Chap 3.9.5.2.1.9.

**Business rules decisions:**

– None identified

**Markup example:**

```
<toolsListGroup>
<toolsListCode>
...
</toolsListCode>
<maintLevel maintLevelCode="ml01">
...
</maintLevel>
<name>
```

```
...
</name>
<natoStockNumber>
...
</natoStockNumber>
<toolRef toolNumber="782345"/>
</toolsListGroup>
```

### 2.6.12 Remarks list

**Description:** The element <remarksList> is used to list remarks pertinent to the maintenance functions listed in maintenance allocation data. The purpose is to provide a list for referencing from maintenance allocation. When remarks are indicated in the maintenance allocation, the remarks list must be included.

**Markup element:** <remarksList> (O)

**Attributes:**

- id (O), the identifier of the <remarksList> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- skillLevelCode (O), the competency level required of the person who will perform the task.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <title> (M), this element is used to capture the remarks list title. It is populated in accordance with Chap 3.9.5.2.1.5.
- <remarksGroup> (M), this element is used to capture remarks pertinent to the maintenance of the assemblies and subassemblies. It includes elements for remarks list code and remarks. Refer to Para 2.6.13.

**Business rules decisions:**

- None identified

**Markup example:**

```
<remarksList>
<title>Remarks</title>
<remarksGroup>
...
</remarksGroup>
</remarksList>
```

### 2.6.13 Remarks group

**Description:** The element <remarksGroup> is used to capture data about the tool or test equipment. It includes elements for tools list code, maintenance, nomenclature, NSN, and tool number.

**Markup element:** <remarksGroup> (M)

**Attributes:**

– None

**Child elements:**

– <remarkCode> (M), this element is used to provide an id for the purposes of cross referencing. The element also allows for string data in the event that a particular code such as "A", "B", or "C" is used to identify the remark in the maintenance allocation data.
– <remarks> (M), this element is used to capture the remarks about the data and is populated in accordance with Chap 3.9.5.1. Refer to Para 2.3.11.

**Business rules decisions:**

– None identified

**Markup example:**

```
<remarksGroup>
<remarkCode id="A1">
...
</remarkCode>
<remarks>
...
</remarks>
</remarksGroup>
```

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use of the element <commonInfo>**. The project or the organization must decide if and how the optional element <commonInfo> will be used. Refer to Para 2.1.

**Use of the optional element <inspectionDefinition>**. The project or the organization must decide if and how the optional element <inspectionDefinition> will be used. Refer to Para 2.3.

**Values for the attribute unitOfMeasure**. The project or the organization must decide on the valid units of measure for threshold information. Refer to Para 2.3.4.

**Values for the attribute thresholdType**. The project or the organization must decide the valid values for the attribute thresholdType, (ie "threshold" or "interval"). Refer to Para 2.3.4.

**Values for the attribute inspectionType**. The project or the organization must decide on values for the inspection types. Refer to Para 2.3.6.

**Values for the attribute releaseEvent**. The project or the organization must decide on the valid values of the attribute releaseEvent (eg "with", "after", "special event"…). Refer to Para 2.3.7.

**Task groupings**. The project or the organization must decide which tasks belong to which groups. Refer to Para 2.3.12.

**Task sequence**. The project or the organization must decide how to sequence the tasks. Refer to Para 2.3.13.

**Use of the attribute `skillLevelCode`**. The project or the organization must determine the values and definitions of the skill level code. Refer to Para 2.3.13, Para 2.4, and Para 2.5.

**Values for the attribute `markerType`**. The project or the organization must establish the valid values for the attribute, `markerType`, of the <`taskMarker`> element. Refer to Para 2.3.14.

**Use of the attribute `taskCode`**. The project or the organization must decide the valid definitions for the `taskCode` attribute values. Refer to Para 2.4.

**Use of the attribute `worthinessLimit`**. The project or the organization must decide whether to use the attribute `worthinessLimit`. Refer to Para 2.4.

**Use of the attribute `reducedMaint`**. The project or the organization must decide whether to use the attribute `reducedMaint`. Refer to Para 2.4.

**Use of the attribute `skillType`**. The project or the organization must decide whether to use the attribute `skillType` and to determine the valid values for the attribute. Refer to Para 2.4.

**Values for the attribute `relatedTaskDescr`**. The project or the organization must decide on the codes to identify task relationships. Refer to Para 2.4.

**Use of the attribute `sourceOfRqmt`**. The project or the organization must establish the valid values for the attribute `sourceOfRqmt`. Refer to Para 2.4.1.

**Use of the attribute `approval`**. The project or the organization must establish the valid values for the attribute `approval`. Refer to Para 2.4.1.

**Values for the attribute `sourceCriticality`**. The project or the organization must decide on the valid values for the attribute `sourceCriticality`. Refer to Para 2.4.2.

**Values for the attribute `sourceTypeCode`**. The project or the organization must decide on the valid values for the attribute `sourceTypeCode`. Refer to Para 2.4.2.

**Use of the element <`preliminaryRqmts`>**. The project or the organization must decide whether to use the element <`preliminaryRqmts`>or not as information can also be retrieved from the referenced Data modules. Refer to Para 2.4.3.

**Control of the names of equipment**. It is important that all names are consistent. The project or the organization must decide whether a terminology database is to be used. Refer to Para 2.4.6.

**Values for the attribute `supervisorLevelCode`**. The project or the organization must define the codes for the attribute `supervisorLevelCode`. Refer to Para 2.4.7.

**Use of the element <`timeLimitCategory`>**. The schema allows for two types of category of time limit. The project or the organization must decide whether their time limit information must be separated into two types and, if so, must define those types. Refer to Para 2.5.2.

**Values for the attribute `limitUnitType`**. The project or the organization must decide on the units for limit information. Refer to Para 2.5.4.

**Values for the attribute `maintLevelCode`**. The project or the organization must decide on the values of the maintenance levels. Refer to Para 2.6.6.

# 4 Examples

| Chap 3.9.5.2.2 | Content section - Descriptive information |

| Chap No./Document No. | Title |
|---|---|
| Chap 3.9.5.3 | Data modules - Applicability |
| Chap 3.9.6.1 | Attributes - Project configurable values |
| Chap 5.2.2.7 | Air specific information sets - Aircrew information |
| Chap 5.2.3 | Information sets - Land/Sea specific information sets |

# 1 General

The Crew Schema is to be used to capture and represent information to be used by crew/operators. The granularity of crew data modules is to follow the breakdown reflected by the SNS.

The use of the common entities, elements and attributes is to be as detailed in Chap 3.9.5.2.1.

# 2 Crew/Operator information

For aircrew information see Chap 5.2.2.7. For crew/operator information for land/sea Products, refer to Chap 5.2.3.

## 2.1 References

For the rules regarding the population of references, refer to Chap 3.9.5.2.1.2.

## 2.2 Warnings and cautions

For the rules regarding the population of warnings and cautions, refer to Chap 3.9.3.

## 2.3 Titles

For the rules regarding the population of references, refer to Chap 3.9.5.2.1.5.

## 2.4 Crew

**Description:** The mandatory element <`crew`> is the container for all crew/operator content (excluding references).

**Markup element:** <`crew`> (M)

**Attributes:**

- `id` (O), the identifier of the <`crew`> element. Refer to Chap 3.9.5.2.1.2.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <`crewRefCard`> (O). Refer to Para 2.4.1.
- <`descrCrew`> (O). Refer to Para 2.4.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use of reference card information
- Use of description information

**Markup example:**

```
<crew>
<crewRefCard>...</crewRefCard>
</crew>
```

### 2.4.1 Reference card

**Description:** The optional element <crewRefCard> is used to contain flight reference card information or its equivalent for land/sea Products.

**Markup element:** <crewRefCard> (O)

**Attributes:**

- warningRefs (O), the warning reference to the warnings and cautions collection. Refer to Chap 3.9.3.
- cautionRefs (O), the caution reference to the warnings and cautions collection. Refer to Chap 3.9.3.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <title> (O). Refer to Chap 3.9.5.2.1.5.
- <warning> (O). Refer to Chap 3.9.3.
- <caution> (O). Refer to Chap 3.9.3.
- <note> (O). Refer to Chap 3.9.3.
- <para> (O). Refer to Chap 3.9.5.2.1.10.
- <crewDrill> (M). Refer to Para 2.4.1.1.
- <figure> (O). Refer to Chap 3.9.5.2.1.7.
- <multimedia> (O). Refer to Chap 3.9.2.4.
- <foldout> (O). Refer to Chap 3.9.5.2.1.7.
- <table> (O). Refer to Chap 3.9.5.2.1.6.

**Business rules decisions:**

- None identified

**Markup example:**

```
<crewRefCard>
<crewDrill>...</crewDrill>
</crewRefCard>
```

#### 2.4.1.1 Drill

**Description:** The element <crewDrill> is used to contain a crew/operator drill.

**Markup element:** <crewDrill> (M)

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the <crewDrill> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- warningRefs (O), the warning reference to the warnings and cautions collection. Refer to Chap 3.9.3.

- `cautionRefs` (O), the caution reference to the warnings and cautions collection. Refer to Chap 3.9.3.
- `drillType` (O), which indicates the type of drill. This attribute can have one of the following values:
  - "`dt00`" - "`dt99`", refer to Chap 3.9.6.1.
- `orderedStepsFlag` (O), indicates whether the drill steps are a chronologically ordered list. This attribute can have one of the following values:
  - "`1`" (yes) indicates that the list is chronologically ordered
  - "`0`" (no) indicates that it is not chronologically ordered
- `crewStepCondition` (O), used to indicate special conditions associated with crew drill step. This attribute can have one of the following values:
  - "`csc00`" - "`csc99`", refer to Chap 3.9.6.1.
- `independentCheck` (O), used to indicate that the step must be checked by a supervisor with a given qualification
- `skillLevelCode` (O), to indicate the skill level required for the step. This attribute can have one of the following values:
  - "`sk01`" - "`sk99`", refer to Chap 3.9.6.1.
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <`title`> (O). Refer to Chap 3.9.5.2.1.5.
- <`thumbTabText`> (O). Refer to Para 2.4.1.1.1.
- <`warning`> (O). Refer to Chap 3.9.3.
- <`caution`> (O). Refer to Chap 3.9.3.
- <`note`> (O). Refer to Chap 3.9.3.
- <`crewMemberGroup`> (O). Refer to Para 2.4.1.1.2.
- <`para`> (O). Refer to Chap 3.9.5.2.1.10.
- <`figure`> (O). Refer to Chap 3.9.5.2.1.7.
- <`multimedia`> (O). Refer to Chap 3.9.2.4.
- <`foldout`> (O). Refer to Chap 3.9.5.2.1.7.
- <`table`> (O). Refer to Chap 3.9.5.2.1.6.
- <`crewDrillStep`> (O). Refer to Para 2.4.1.1.4.
- <`if`> (O). Refer to Para 2.4.1.1.7.
- <`elseIf`> (O). Refer to Para 2.4.1.1.11.
- <`case`> (O). Refer to Para 2.4.1.1.12.
- <`subCrewDrill`> (O). Refer to Para 2.4.1.1.13.
- <`endMatter`> (O). Refer to Para 2.4.1.1.14.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use of the attribute `independentCheck`
- Use of the attribute `skillLevelCode`
- Use of the attribute `crewStepCondition`

**Markup example:**

```
<crewDrill>
<title>Brakes</title>
<subCrewDrill>...</subCrewDrill>
</crewDrill>
```

*2.4.1.1.1 Tab text*

**Description:** The element <thumbTabText> is used to contain thumb tab text for the drill or subdrill.

**Markup element:** <thumbTabText> (O)

**Attributes:**

– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

**Child elements:**

– <internalRef> (O). Refer to Chap 3.9.5.2.1.2.
– <indexFlag> (O). Refer to Chap 3.9.5.2.1.10.
– <symbol> (O). Refer to Chap 3.9.5.2.1.10.
– <subScript> (O). Refer to Chap 3.9.5.2.1.10.
– <superScript> (O). Refer to Chap 3.9.5.2.1.10.
– <footnoteRef> (O). Refer to Chap 3.9.5.2.1.10.
– <acronym> (O). Refer to Chap 3.9.5.2.1.10.
– <acronymTerm> (O). Refer to Chap 3.9.5.2.1.10.
– <captionGroup> (O). Refer to Chap 3.9.5.2.1.4.
– <caption> (O). Refer to Chap 3.9.5.2.1.4.

**Business rules decisions:**

– None identified

**Markup example:**

```
<thumbTabText>
<caption><captionLine>...</captionLine></caption>
</thumbTabText>
```

*2.4.1.1.2 Crew*

**Description:** The element <crewMemberGroup> is used to identify the crew/operator responsible for carrying out an action.

**Markup element:** <crewMemberGroup> (O)

**Attributes:**

– applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
– actionResponsibility (O). This attribute can have one of the following values:
  - "all" indicates whether all of the crew/operator listed are responsible for performing the actions
  - "any" indicates whether any of the crew/operator listed are responsible for performing the actions

**Child elements:**

– <crewMember> (M). Refer to Para 2.4.1.1.3.

**Business rules decisions:**

– None identified

**Markup example:**

```
<crewMemberGroup>
<crewMember crewMemberType="cm01">...</crewMember>
</crewMemberGroup>
```

*2.4.1.1.3 Crew member*

**Description:** The empty, conditionally mandatory element <crewMember> is used to identify a crew/operator member.

**Markup element:** <crewMember> (M)

**Attributes:**

– applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
– crewMemberType (M), used to indicate a type of crew member. This attribute can have one of the following values:
  - "cm01" - "cm99", refer to Chap 3.9.6.1.

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the crewMemberType values

**Markup example:**

```
<crewMember crewMemberType="cm02"></crewMember>
<crewMember crewMemberType="cm03"></crewMember>
```

*2.4.1.1.4 Crew drill step*

**Description:** The element <crewDrillStep> is used to identify a step in a crew/operator data module.

**Markup element:** <crewDrillStep> (O)

**Attributes:**

– applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
– id (O), the identifier of the <crewDrillStep> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– warningRefs (O), the warning reference to the warnings and cautions collection. Refer to Chap 3.9.3.
– cautionRefs (O), the caution reference to the warnings and cautions collection. Refer to Chap 3.9.3.
– stepLabel (O), used to identify the label of the step
– keepWithNext (O), used to indicate whether a step is presented together with the next step. This attribute has no meaning when placed on a final step. This attribute can have one of the following values:

  - "1" (yes), indicates that the step should be kept with the next sibling step (if one exists) and therefore, all children of the step for which the attribute is set should be kept together as well (if possible)
  - "0" (no) (D), indicates that it need not be kept with the next sibling step
- memorizeStepsFlag (O), used to indicate whether a step must be memorized by crew/operator. This attribute can have one of the following values:
  - "1" (yes), indicates that the step should be memorized by the crew/operator
  - "0" (no) (D), indicates that it need not be memorized
- separatorStyle (O), used to indicate the separator characters between a challenge and a response. This attribute can have one of the following values:
  - "dot" to indicate a sequence of dots
  - "line" to indicate a line
  - "none" to indicate no separator
- orderedStepsFlag (O), indicates whether the drill steps are a chronologically ordered list. This attribute can have one of the following values:
  - "1" (yes) indicates that the list is chronologically ordered
  - "0" (no) indicates that it is not chronologically ordered
- crewStepCondition (O), used to indicate special conditions associated with crew drill step. This attribute can have one of the following values:
  - "csc00" - "csc99", refer to Chap 3.9.6.1.
- independentCheck (O), used to indicate that the step must be checked by a supervisor with a given qualification
- skillLevelCode (O), to indicate the skill level required for the step
  - "sk01" - "sk99", refer to Chap 3.9.6.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <title> (O). Refer to Chap 3.9.5.2.1.5.
- <warning> (O). Refer to Chap 3.9.3.
- <caution> (O). Refer to Chap 3.9.3.
- <note> (O). Refer to Chap 3.9.3.
- <para> (O). Refer to Chap 3.9.5.2.1.10.
- <figure> (O). Refer to Chap 3.9.5.2.1.7.
- <multimedia> (O). Refer to Chap 3.9.2.4.
- <foldout> (O). Refer to Chap 3.9.5.2.1.7.
- <table> (O). Refer to Chap 3.9.5.2.1.6.
- <caption> (O). Refer to Chap 3.9.5.2.1.4.
- <crewMemberGroup> (O). Refer to Para 2.4.1.1.2.
- <crewProcedureName> (O). Refer to Para 2.4.1.1.5.
- <challengeAndResponse> (O). Refer to Para 2.4.1.1.6.
- <crewDrillStep> (O). Refer to Para 2.4.1.1.4.
- <if> (O). Refer to Para 2.4.1.1.7.
- <elseIf> (O). Refer to Para 2.4.1.1.11.
- <case> (O). Refer to Para 2.4.1.1.12.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use of the attribute `keepWithNext`
- Use of the attribute `independentCheck`
- Use of the attribute `skillLevelCode`

**Markup example:**

```
<crewDrillStep>
<challengeAndResponse>...</challengeAndResponse>
</crewDrillStep>
```

*2.4.1.1.5 Crew/operator procedure*

**Description:** The element <`crewProcedureName`> is used to identify a crew/operator procedure.

**Markup element:** <`crewProcedureName`> (O)

**Attributes:**

- `applicRefId` (O), the applicability information. Refer to Chap 3.9.5.3.
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.

**Child elements:**

- <`para`> (O). Refer to Chap 3.9.5.2.1.10.
- <`figure`> (O). Refer to Chap 3.9.5.2.1.7.
- <`multimedia`> (O). Refer to Chap 3.9.2.4.
- <`foldout`> (O). Refer to Chap 3.9.5.2.1.7.
- <`table`> (O). Refer to Chap 3.9.5.2.1.6.

**Business rules decisions:**

- None identified

**Markup example:**

```
<crewProcedureName>
<para>Tighten clamp bolt</para>
</crewProcedureName>
```

*2.4.1.1.6 Crew/operator challenge and response*

**Description:** The element <`challengeAndResponse`> is used to identify a crew/operator challenge and response.

**Markup element:** <`challengeAndResponse`> (O)

**Attributes:**

- None

**Child elements:**

- <`challenge`> (M). Refer to Para 2.4.1.1.7.
- <`crewMemberGroup`> (O). Refer to Para 2.4.1.1.2.
- <`response`> (M). Refer to Para 2.4.1.1.8.

**Business rules decisions:**

– None identified

**Markup example:**

```
<challengeAndResponse>
<challenge>
<para>Floodlights</para>
</challenge>
<response>
<para>ON if required</para>
</response>
</challengeAndResponse>
```

*2.4.1.1.7 Challenge*

**Description:** The element <challenge> is used to identify a crew/operator challenge and response.

**Markup element:** <challenge> (M)

**Attributes:**

– applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
– authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.

**Child elements:**

– <para> (O). Refer to Chap 3.9.5.2.1.10.
– <figure> (O). Refer to Chap 3.9.5.2.1.7.
– <multimedia> (O). Refer to Chap 3.9.2.4.
– <foldout> (O). Refer to Chap 3.9.5.2.1.7.
– <table> (O). Refer to Chap 3.9.5.2.1.6.

**Business rules decisions:**

– None identified

**Markup example:**

```
<challenge>
<para>Axel Nuts</para>
</challenge>
```

*2.4.1.1.8 Response*

**Description:** The element <response> is the expected response to the challenge.

**Markup element:** <response> (M)

**Attributes:**

– applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.

**Child elements:**

– <para> (O). Refer to Chap 3.9.5.2.1.10.
– <figure> (O). Refer to Chap 3.9.5.2.1.7.
– <multimedia> (O). Refer to Chap 3.9.2.4.
– <foldout> (O). Refer to Chap 3.9.5.2.1.7.
– <table> (O). Refer to Chap 3.9.5.2.1.6.

**Business rules decisions:**

– None identified

**Markup example:**

```
<response>
<para>Tight</para>
</response>
```

*2.4.1.1.9 If statement*

**Description:** The element <if> is used to identify an "if" statement.

**Markup element:** <if> (O)

**Attributes:**

– applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
– id (O), the identifier of the <if> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– <caseCond> (M). Refer to Para 2.4.1.1.10.
– <crewDrillStep> (O). Refer to Para 2.4.1.1.4.
– <elseIf> (O). Refer to Para 2.4.1.1.11.
– <if> (O)
– <case> (O). Refer to Para 2.4.1.1.12.

**Business rules decisions:**

– None identified

**Markup example:**

```
<if>
<caseCond>Handlebars twist in stem</caseCond>
<crewDrillStep>
<crewProcedureName><para>Tighten clamp bolt</para>
</crewProcedureName>
</crewDrillStep>
</if>
```

*2.4.1.1.10 Condition statement*

**Description:** The element <caseCond> is used to identify a condition as part of an "if" statement.

**Markup element:** <caseCond> (O)

**Attributes:**

– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <functionalItemRef> (O). Refer to Chap 3.9.5.1.
- <circuitBreakerRef> (O). Refer to Chap 3.9.5.2.1.10.
- <controlIndicatorRef> (O). Refer to Chap 3.9.5.2.1.10.
- <inlineSignificantData> (O). Refer to Chap 3.9.5.2.1.10.
- <quantity> (O). Refer to Chap 3.9.5.2.1.10.
- <internalRef> (O). Refer to Chap 3.9.5.2.1.2.
- <indexFlag> (O). Refer to Chap 3.9.5.2.1.10.
- <changeInline> (O). Refer to Chap 3.9.5.2.1.1.
- <emphasis> (O). Refer to Chap 3.9.5.2.1.10.
- <symbol> (O). Refer to Chap 3.9.5.2.1.10.
- <subScript> (O). Refer to Chap 3.9.5.2.1.10.
- <superScript> (O). Refer to Chap 3.9.5.2.1.10.
- <dmRef> (O). Refer to Chap 3.9.5.2.1.2.
- <externalPubRef> (O). Refer to Chap 3.9.5.2.1.2.
- <footnote> (O). Refer to Chap 3.9.5.2.1.10.
- <footnoteRef> (O). Refer to Chap 3.9.5.2.1.10.
- <acronym> (O). Refer to Chap 3.9.5.2.1.10.
- <acronymTerm> (O). Refer to Chap 3.9.5.2.1.10.
- <captionGroup> (O). Refer to Chap 3.9.5.2.1.4.
- <caption> (O). Refer to Chap 3.9.5.2.1.4.

**Business rules decisions:**

- None identified

**Markup example:**

```
<caseCond>Stem is loose</caseCond>
```

*2.4.1.1.11 Else-if statement*

**Description:** The element <elseIf> is used to identify an "if" statement to be used if another "if" condition is not met.

**Markup element:** <elseIf> (O)

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the <elseIf> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <caseCond> (M). Refer to Para 2.4.1.1.10.
- <crewDrillStep> (O). Refer to Para 2.4.1.1.4.
- <case> (O). Refer to Para 2.4.1.1.12.
- <if> (O). Refer to Para 2.4.1.1.7.
- <elseIf> (O). Refer to Para 2.4.1.1.11.

**Business rules decisions:**

– None identified

**Markup example:**

```
<elseIf>
<caseCond>Clamp loose</caseCond>
<crewDrillStep>
<crewProcedureName>
<para>Tighten clamp</para>
</crewProcedureName>
</crewDrillStep>
</elseIf>
```

*2.4.1.1.12 Case statement*

**Description:** The element <case> is used to identify a case as part of a list of possible cases.

**Markup element:** <case> (O)

**Attributes:**

– applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
– id (O), the identifier of the <case> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– <caseCond> (M). Refer to Para 2.4.1.1.10.
– <crewDrillStep> (O). Refer to Para 2.4.1.1.4.
– <case> (O). Refer to Para 2.4.1.1.12.
– <if> (O). Refer to Para 2.4.1.1.7.
– <elseIf> (O). Refer to Para 2.4.1.1.11.

**Business rules decisions:**

– None identified

**Markup example:**

```
<case>
<caseCond>Dial set to A</caseCond>
<crewDrillStep>
<crewProcedureName>
<para>Set dial to B</para>
</crewProcedureName>
</crewDrillStep>
</case>
<case>
<caseCond>Dial set to B</caseCond>
<crewDrillStep>
<crewProcedureName>
<para>Do nothing</para>
</crewProcedureName>
</crewDrillStep>
</case>
```

*2.4.1.1.13 Subdrill statement*

**Description:** The element <subCrewDrill> is used to identify a subdrill, which is part of a crew/operator drill.

**Markup element:** <subCrewDrill> (O)

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the <subCrewDrill> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- warningRefs (O), the warning reference to the warnings and cautions collection. Refer to Chap 3.9.3.
- cautionRefs (O), the caution reference to the warnings and cautions collection. Refer to Chap 3.9.3.
- orderedStepsFlag (O), indicates whether the drill steps are a chronologically ordered list. This attribute can have one of the following values:
  - "1" (yes) indicates that the list is chronologically ordered
  - "0" (no) indicates that it is not chronologically ordered
- independentCheck (O), used to indicate that the step must be checked by a supervisor with a given qualification
- skillLevelCode (O), to indicate the skill level required for the step
  - "sk01" - "sk99", refer to Chap 3.9.6.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <title> (O). Refer to Chap 3.9.5.2.1.5.
- <thumbTabText> (O). Refer to Para 2.4.1.1.1.
- <warning> (O). Refer to Chap 3.9.3.
- <caution> (O). Refer to Chap 3.9.3.
- <note> (O). Refer to Chap 3.9.3.
- <crewMemberGroup> (O). Refer to Para 2.4.1.1.2.
- <para> (O). Refer to Chap 3.9.5.2.1.10.
- <figure> (O). Refer to Chap 3.9.5.2.1.7.
- <multimedia> (O). Refer to Chap 3.9.2.4.
- <foldout> (O). Refer to Chap 3.9.5.2.1.7.
- <table> (O). Refer to Chap 3.9.5.2.1.6.
- <crewDrillStep> (O). Refer to Para 2.4.1.1.4.
- <if> (O). Refer to Para 2.4.1.1.7.
- <elseIf> (O). Refer to Para 2.4.1.1.11.
- <case> (O). Refer to Para 2.4.1.1.12.

**Business rules decisions:**

- None identified

**Markup example:**

```
<subCrewDrill>
<title>Callipers</title>

</challenge>
<response>
<para>Firmly attached</para>
</response>
</challengeAndResponse>
</crewDrillStep>
</subCrewDrill>
```

*2.4.1.1.14 End matter statement*

**Description:** The element <endMatter> is used to contain end matter using the element <para>.

**Markup element:** <endMatter> (O)

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.

**Child elements:**

- <para> (O). Refer to Chap 3.9.5.2.1.10.
- <figure> (O). Refer to Chap 3.9.5.2.1.7.
- <multimedia> (O). Refer to Chap 3.9.2.4.
- <foldout> (O). Refer to Chap 3.9.5.2.1.7.
- <table> (O). Refer to Chap 3.9.5.2.1.6.

**Business rules decisions:**

- None identified

**Markup example:**

```
<endMatter>
<para>...</para>
</endMatter>
```

**2.4.2 Descriptive information for crew/operators**

**Description:** The element <descrCrew> is to be used to contain descriptive information for use by crew/operators.

**Markup element:** <descrCrew> (O)

**Attributes:**

- warningRefs (O), the warning reference to the warnings and cautions collection. Refer to Chap 3.9.3.
- cautionRefs (O), the caution reference to the warnings and cautions collection. Refer to Chap 3.9.3.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <warning> (O). Refer to Chap 3.9.3.
- <caution> (O). Refer to Chap 3.9.3.
- <note> (O). Refer to Chap 3.9.3.
- <levelledPara> (O). Refer to Chap 3.9.5.2.2, with the inclusion of <crewDrill>, refer to Para 2.4.1.1.
- <figure> (O). Refer to Chap 3.9.5.2.1.7.
- <multimedia> (O). Refer to Chap 3.9.2.4.
- <foldout> (O). Refer to Chap 3.9.5.2.1.7.
- <table> (O). Refer to Chap 3.9.5.2.1.6.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use of descriptive information

**Markup example:**

```
<descrCrew>
<levelledPara>
<title>Introduction</title>
<para>Data about the bicycle and its control system is given in
this document. This data will help you operate the
bicycle.</para>
</levelledPara>
</descrCrew>
```

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use of the reference information branch**. The project of the organization must decide whether to use the element <crewRefCard> or not. Refer to Para 2.4.1.

**Use of the attribute independentCheck**. The project or the organization must decide whether to use the attribute independenCheck or not. Refer to Para 2.4.1.1.

**Use of the attribute skillLevelCode**. The project or the organization must decide whether to use the attribute skillLevelCode or not. Refer to Para 2.4.1.1.

**Use of the attribute crewStepCondition**. The project or the organization must decide whether to use the attribute crewStepCondition or not. Refer to Para 2.4.1.1.

**Use of the attribute crewMemberType**. The project or the organization must decide whether to use the attribute crewMemberType or not. Refer to Para 2.4.1.1.3.

**Use of the attribute keepWithNext**. The project or the organization must decide whether to use the attribute keepWithNext or not. Refer to Para 2.4.1.1.4.

**Use of the descriptive information branch**. The project or the organization must decide whether to use the element <descrCrew> or not. Descriptive information could be captured using the descriptive Schema exclusively, however, for crew/operator information this is not recommended. Refer to Para 2.4.2.

# 4 Examples

```
<crewRefCard>
<crewDrill>
<crewMemberGroup>
<crewMember crewMemberType="cm02"></crewMember>
<crewMember crewMemberType="cm03"></crewMember>

# 1 General

The IPD Schema is to be used to capture and represent parts lists and IPD. This information can be drawn from S2000M provisioning database or from engineering data for non-S2000M projects.

# 2 Parts information

**Description:** The element <content> is the container for all parts content. This element is used to contain the illustrated parts catalog information of a data module.

**Markup element:** <content> (M)

ICN-S1000D-A-030905-D-F6117-00001-A-001-01

*Fig 1 Element <content>*

**Attributes:**

– id (O), the identifier of the <content> element. Refer to Chap 3.9.5.2.1.2.

**Child elements:**

– <refs> (O). Refer to Chap 3.9.5.2.1.2.
– <illustratedPartsCatalog> (M). Refer to Para 2.1.

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

## 2.1 Illustrated parts catalog

**Description:** The element <illustratedPartsCatalog> is used to contain the illustrated parts catalog information of a data module (excluding references).

**Markup element:** <illustratedPartsCatalog> (M)

ICN-S1000D-A-030905-D-F6117-00002-A-001-01

*Fig 2 Element <illustratedPartsCatalog>*

**Attributes:**

– None

**Child elements:**

– <figure> (O). Refer to Chap 3.9.5.2.1.7.
– <multimedia> (O). Refer to Chap 3.9.2.4.
– <initialProvisioningProject> (O). Refer to Para 2.2.
– <zoneGroup> (O). Refer to Para 2.3.
– <catalogSeqNumber> (M). Refer to Para 2.4.

**Business rules decisions:**

– None identified

**Markup example:**

```
<illustratedPartsCatalog>
<figure>...</figure>
<initialProvisioningProject>...</initialProvisioningProject>
<catalogSeqNumber catalogSeqNumberValue="72016710
010A">...</catalogSeqNumber>
</illustratedPartsCatalog>
```

## 2.2 Initial provisioning project number

**Description:** The element <initialProvisioningProject> is used to store information regarding the Initial Provisioning Project (IPP).

**Markup element:** <initialProvisioningProject> (O)

**Attributes:**

– applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
– id (O), the identifier of the <initialProvisioningProject> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– initialProvisioningProjectNumber. (M) This mandatory attribute is used to break the complete Initial Provisioning Project Number (IPPN) information into manageable sections. This allows for the identification of spares and the regulation of processes by section. The first five characters comprise the North Atlantic Treaty Organisation (NATO) supply code for manufacturers (CAGE). The sixth to the ninth characters are a serial number allocated by the project.
– initialProvisioningProjectNumberSubject. (M) This mandatory attribute is used to store the IPPN subject. The attribute contains the first 19 characters of the "description for part" stored in accordance with S2000M.
– fileIdent. (O) The optional file identifier (FID) is used to define whether the IPPN is for the complete Product or a component. The attribute will be set to "s" to indicate the complete Product or "t" to indicate a component part of the Product.
– languageCode. (O) The optional language code (LGE) is used to determine the language in which data is transmitted and is to be populated with the user (nation) code.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– <subjectVariantSegment> (O). Refer to Para 2.2.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– The sixth to ninth characters of the IPPN are controlled by the project. These codes must not be duplicated within a project.

**Markup example:**

```
<initialProvisioningProject
initialProvisioningProjectNumber="F611723121110"
initialProvisioningProjectNumberSubject="Servo actuator"
fileIdent="t">...</initialProvisioningProject>
```

### 2.2.1 Subject variant

**Description:** the element <subjectVariantSegment> is used to identify the S2000M subject variant segment (VAS). It is used as an extension of the IPPN to store information regarding the identification (PN, NSCM and NSN) of the subject for which the IPP has been prepared. In those cases where the IPP presents data against variants of the subject, then this element is repeated the appropriate number of times to hold all the variants' identifications (limited to eight as stated in S2000M).

If the element is not used, then the corresponding information can be retrieved from the first data module (figure) of the IPP, ie from all first CSNs (digits 10 to 13: item numbers and item number variants) given there.

**Markup element:** <subjectVariantSegment> (O)

**Attributes:**

– None

**Child elements:**

– <subjectIdent> (M). Refer to Para 2.2.1.1.
– <natoStockNumber> (O). Refer to Para 2.2.1.4.

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

#### 2.2.1.1 Subject identification

**Description:** The element <subjectIdent> is used to store the subject's identification (SID) and provides identification of the item, or items, which are the subjects of the IPPN.

**Markup element:** <subjectIdent> (O)

**Attributes:**

– None

**Child elements:**

- <manufacturerCode> (M). Refer to Para 2.2.1.2.
- <partNumber> (M). Refer to Para 2.2.1.3.

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

2.2.1.2 Manufacturer

**Description:** The element <manufacturerCode> contains an identifier for the manufacturer of the equipment. The textual content is the CAGE code for the manufacturer.

**Markup element:** <manufacturerCode> (M)

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the <manufacturerCode> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Defining a list of CAGE codes

**Markup example:**

Refer to Para 4.

2.2.1.3 Part number

**Description:** The element <partNumber> is used to store the part number of an item. This part number is allocated by the design authority of the equipment.

**Markup element:** <partNumber> (M)

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the <partNumber> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

2.2.1.4 Subject NATO stock number

**Description:** The element <natoStockNumber> is used here to contain the NATO (or NSN for the SID.

**Markup element:** <natoStockNumber> (O)

**Attributes:**

– id (O), the identifier of the <natoStockNumber> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– natoSupplyClass. (O) This optional attribute is used to contain the NATO Supply Class (NSC).
– natoCodificationBureau. (O) This optional attribute is used to contain the first two digits of the NATO Item Identification Number (NIN) in the format of the National Codification Bureau (NCB).
– natoItemIdentNumberCore. (O) This optional attribute is used to contain the third to ninth digit of the NIN.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– <fullNatoStockNumber> (O), contains the full NATO stock number
– <refs> (O). Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– defining if the NATO Stock Number is to be split within its attribute fields or directly filled as a whole in its full NATO stock number child element

**Markup example:**

Refer to Para 4.

## 2.3 Zones

**Description:** The element <zoneGroup> is used to indicate the zoning information of a figure, in order to know where components, described in a figure, are installed on the product. For instance in case of damage it enables all the figures impacted by the damage to be easily identified.

**Markup element:** <zoneGroup> (O)

**Attributes:**

– None

**Child elements:**

– <zoneRef> (C). Refer to Para 2.3.1.

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

### 2.3.1 Zone reference

**Description:** The element <zoneRef> is used to contain the zoning information (one or more) as described at Chap 3.4. It is used in accordance with the rules in Chap 4.13.2.

**Markup element:** <zoneRef> (C)

**Attributes:**

– id (O), the identifier of the <zoneRef> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– zoneNumber (O) the zone identifier. Refer to Chap 3.4.
– lsarData (O), this attribute is used to record the LSA information that is applicable to the zone.
– authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– <name> (O), the nomenclature associated with the zone.
– <refs> (O). Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

## 2.4 Catalogue sequence number

**Description:** The mandatory repeatable element <catalogSeqNumber> is used to store the catalogue sequence number (CSN) and all related parts information.

**Markup element:** <catalogSeqNumber> (M)

ICN-S1000D-A-030905-D-F6117-00003-A-001-01

*Fig 3 Element <`catalogSeqNumber`>*

**Attributes:**

- `id` (O), the identifier of the <`catalogSeqNumber`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `catalogSeqNumberValue` (O), This attribute is used to capture a CSN. A CSN captures the location of an item within the Illustrated Parts Catalog (IPC) in terms of its SNS. The code is made up as shown in Table 2, where "b" means a single space character (blank).

*Table 2 Catalogue sequence number*

| Position | Content for chapterized IPD | Content for non-chapterized IPD |
|---|---|---|
| 1 and 2 | Chapter (from the SNS) | bb |
| 3 | Sub-chapter (from the SNS) | b |
| 4 | Sub-subchapter (from the SNS) | b |
| 5 and 6 | Unit or assembly (from the SNS) | bb |
| 7 and 8 | Figure number | Figure number |
| 9 | Figure number variant | Figure number variant |
| 10, 11 and 12 | Item number | Item number |
| 13 | Item number variant | Item number variant |

When a CSN is given for the Product (chapterized IPD), the complete content of this data element is to be provided.

Example:

```
<catalogSeqNumber catalogSeqNumberValue="72016710 000 " ...>.
```

When a CSN is contained in the separate IP presentation of equipments (non-chapterized IPD) then only the last seven characters are applicable and the first six are to be filled with spaces.

Example:

```
<catalogSeqNumber catalogSeqNumberValue="    01 001 " ...>.
```

- `indenture` (M). This attribute is used to contain the indenture (IND) of an item. This single character numeric code indicates the hierarchical level of an item within the breakdown of a figure. Indenture values must only be "`1`" thru "`9`".
- `itemItemVariantIdent` (O). This attribute is used to contain always the four characters made from the item number and the item number variant. If item number variant is not given, it must be filled with a single space character (eg `itemItemVariantIdent="0001"`).
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <`functionalItemRef`> (O). Refer to Para 2.4.1.
- <`accessPointRef`> (O). Refer to Para 2.4.1.2.
- <`internalRef`> (O). Refer to Para 2.4.2.
- <`itemSequenceNumber`> (M). Refer to Para 2.5.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- structure and rules for the SNS and CSN

**Markup example:**

Refer to Para 4.

### 2.4.1 Function position link

**Description:** This optional link is addressed thru either functional item numbers (refer to Para 2.4.1.1) or access point's identification (refer to Para 2.4.1.2).

#### 2.4.1.1 Functional item number

**Description:** The element <`functionalItemRef`> is used to indicate a Functional Item Number (Refer to Chap 3.9.5.2.11) for the description of this element and its attributes.

**Markup element:** <`functionalItemRef`> (O)

**Attributes:**

- `id` (O), the identifier of the <`functionalItemRef`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `functionalItemNumber` (M), used to give the functional item number code.
- `functionalItemType` (O), used to indicate the functional item number type.
- `manufacturerCodeValue` (O), used to indicate the manufacturer CAGE code.
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.

– `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– <`name`> (O), the nomenclature for the functional item.
– <`refs`> (O). Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

2.4.1.2 Access point

**Description:** The element <`accessPointRef`> is used to store the access point's identification where an item is located. It is used in accordance with the rules in Chap 3.4.

**Markup element:** <`accessPointRef`> (O)

**Attributes:**

– `id` (O), the identifier of the <`accessPointRef`> element. Refer to Chap 3.9.5.2.1.2.
– `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– `accessPointNumber` (O), used to indicate the access panel code.
– `accessPointTypeValue` (O), used to indicate the access panel type.
– `lsarData` (O), this attribute is used to contain a reference to the applicable LSA data.
– `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
– `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– <`name`> (O), the nomenclature of the access point
– <`refs`> (O). Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

**2.4.2 Internal reference**

**Description:** The element <`internalRef`> is used to indicate the internal references used within the core of the IPD data module content, it refers to the hotspots mechanism. Refer to Chap 3.9.5.2.1.2.

**Markup element:** <`internalRef`> (O).

**Attributes:**

- `applicRefId` (O), the applicability information. Refer to Chap 3.9.5.3.
- `internalRefId` (O), used to define the internal reference identifier.
- `internalRefTargetType` (O), used to define the internal reference target type.
- `referredFragment` (O), used to refer to a dedicated fragment.
- `targetTitle` (O), used to define the target title.
- `xlink` (O), attributes (`type, href, title, show, actuate`), which are used to manage the W3C Xlink attributes.
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.

**Child elements:**

- <`subScript`> (O). Refer to Chap 3.9.5.2.1.10.
- <`superScript`> (O). Refer to Chap 3.9.5.2.1.10

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of the generic hotspots mechanism

**Markup example:**

```
<internalRef internalRefId="fig-0001-gra-0001-hot-0006"
internalRefTargetType="hotspot">...</internalRef>
```

## 2.5 Item sequence number

**Description:** The mandatory, repeatable element <`itemSequenceNumber`> is used to store the Item Sequence Number (ISN). It also contains elements which store metadata about the item.

**Markup element:** <`itemSequenceNumber`> (M)

ICN-S1000D-A-030905-D-F6117-00004-A-001-01

*Fig 4 Element <`itemSeqNumber`>*

**Attributes:**

- `applicRefId` (O), the applicability information. Refer to Chap 3.9.5.3.
- `id` (O), the identifier of the <`itemSeqNumber`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `itemSeqNumberValue` (M), used to store the ISN. Positions one and two of the ISN comprise a sequence number, the first number being "00", which is incremented in steps of 5. Position three contains an alphanumeric variant code.

- partCharacteristic (O), used to indicate special part characteristics. Attribute values "pc00" to "pc50" are reserved for S1000D assignment as defined in Chap 3.9.6.1. Values from "pc51" to "pc99"are available for project use.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <reasonForSelection> (O) Reason for selection information Refer to Para 2.5.1.
- <quantityPerNextHigherAssy> (M) Quantity per next higher assembly Refer to Para 2.5.2.
- <manufacturerCode> (M) NATO supply code for manufacturers (CAGE) Refer to Para 2.5.3.
- <partNumber> (M) Part number information Refer to Para 2.5.4.
- <partIdentSegment> (O) Part identity information Refer to Para 2.5.5.
- <natoStockNumber> (O) NATO stock number Refer to Para 2.5.6.
- <partLocationSegment> (O) Part location information Refer to Para 2.5.7.
- <applicabilitySegment> (O) Applicability information Refer to Para 2.5.8.
- <categoryOneContainerLocation> (O) Container information Refer to Para 2.5.9.
- <locationRcmdSegment> (M) Location recommendation information Refer to Para 2.5.10.
- <referenceDesignator> (O) Reference designator Refer to Para 2.5.11.
- <ilsNumber> (O) Integrated logistic information Refer to Para 2.5.12.
- <changeAuthorityNumber> (O) Change authority information Refer to Para 2.5.13.
- <genericPartDataGroup> (O) Program specific information Refer to Para 2.5.14.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of the attribute applicRefIds

**Markup example:**

Refer to Para 4.

### 2.5.1 Reason for selection

**Description:** The element <reasonForSelection> is used to store the Reason For Selection (RFS) of an item.

**Markup element:** <reasonForSelection> (O)

**Attributes:**

- id (O), the identifier of the <reasonForSelection> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- reasonForSelectionValue (M), which be populated using data Table 3.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

*Table 3 Reason for selection*

| Value | Reason |
|---|---|
| "0" | Not a recommended spare |
| "1" | Wear |
| "2" | Maintenance damage |
| "3" | Loss |
| "4" | Vibration |
| "5" | Corrosion |
| "6" | Deterioration |
| "7" | Extreme temperature |
| "8" | Other |
| "9" | Accidental damage (Insurance) |

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

### 2.5.2 Quantity per next higher assembly

**Description:** The element <quantityPerNextHigherAssy> is used to store the Quantity per Next higher Assembly (QNA) of an item. If the item is included for reference only the letters "REF" are entered. If the quantity cannot be established or it is otherwise not appropriate to include the data, the letters "AR" (As Required) are entered.

**Markup element:** <quantityPerNextHigherAssy> (M)

**Attributes:**

– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

### 2.5.3 Manufacturer

**Description:** The element <manufacturerCode> is used to contain the NATO supply code for manufacturers (CAGE).

**Markup element:** <manufacturerCode> (M)

**Attributes:**

- id (O), the identifier of the <manufacturerCode> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

### 2.5.4 Part number

**Description:** The element <partNumber> is used to store the part number of an item. This part number is allocated by the design authority of the equipment.

**Markup element:** <partNumber> (M)

**Attributes:**

- id (O), the identifier of the <partNumber> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

### 2.5.5 PAS data

**Description:** The element <partIdentSegment> is used to identify a S2000M Part Identity Segment (PAS). This element is optional to allow the use of external reference to the parts information data of the technical information repository data module.

**Markup element:** <partIdentSegment> (O)

ICN-S1000D-A-030905-D-F6117-00005-A-001-01

*Fig 5 Element <partIdentSegment>*

**Attributes:**

– None

**Child elements:**

– <descrForPart> (M). Refer to Para 2.5.5.1.
– <descrForItem> (O). Refer to Para 2.5.5.2.
– <unitOfIssue> (O). Refer to Para 2.5.5.3.
– <unitOfIssueQualificationSegment> (O). Refer to Para 2.5.5.4.
– <specialStorage> (O). Refer to Para 2.5.5.5.
– <fitmentCode> (O). Refer to Para 2.5.5.6.
– <physicalSecurityPilferageCode> (O). Refer to Para 2.5.5.7.
– <calibrationMarker> (O). Refer to Para 2.5.5.8.

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

2.5.5.1 Description for part

**Description:** The element <descrForPart> is used to hold a detailed Description For a Part (DFP). This should be the identifying noun of the item followed by and appropriate adjective and further details if necessary.

**Markup element:** <descrForPart> (M)

**Attributes:**

– `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

2.5.5.2 Description for Item

**Description:** The element <`descrForItem`> is used to hold a detailed Description of the Item and could be populated as given in Table 4.

**Markup element:** <`descrForItem`> (M)

**Attributes:**

– `descrForItemCode` (O) which is used to identify the type of part and should be populated using data from Table 4.

*Table 4 Type of Part*

| Value | Meaning |
|---|---|
| "`part`" | Identifies the part as a standard part |
| "`exp`" | Identifies the part as an expendable part |
| "`coei`" | Identifies the part as a components of end item part |
| "`bii`" | Identifies the part as a basic issue item part |
| "`aal`" | Identifies the part as an item required to operate equipment |
| "`tool`" | Identifies the part as a tool item |
| "`special tool`" | Identifies the part as a special tool |

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

2.5.5.3 Unit of issue

**Description:** The element <unitOfIssue > is used to store Unit of Issue (UOI) information. The unit of issue is used to indicate the physical measurement, count or container in which the item is issued.

**Markup element:** <unitOfIssue > (O)

**Attributes:**

– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

2.5.5.4 PCS data

**Description:** The element <unitOfIssueQualificationSegment> is used to identify a S2000M Unit of Issue Qualification Segment (PCS) segment.

**Markup element:** <unitOfIssueQualificationSegment> (O)

**Attributes:**

– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– unitOfMeasure (M). This mandatory attribute is used to store the unit of measurement for the item.

**Child elements:**

– <quantityPerUnit> (M). This element contains the quantity of items per unit of issue.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– allowable values for the attribute unitOfMeasure

2.5.5.5 Special storage

**Description:** The element <specialStorage> is used to record whether an item requires special storage. A value of "0" indicates that the item does not require special storage. A value of "1" indicates that the item has special storage requirements. If the value of <specialStorage> is set to "1" then the element <reasonForSelection> must not be set to "0".

**Markup element:** <specialStorage> (O)

**Attributes:**

– `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

2.5.5.6 Fitment code

**Description:** The element <`fitmentCode`> is used to indicate whether an item can be fitted as supplied.

**Markup element:** <`fitmentCode`> (O)

**Attributes:**

– `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– `fitmentCodeValue` (M) This mandatory attribute is used to store the fitment code value. A value of "`1`" indicates that the part needs drilling, reaming or trimming during fitting which should usually be carried out at organizational or intermediate level. A value of "`m`" indicates that the part needs depot or industrial maintenance organization level facilities for fitting.

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

2.5.5.7 Physical security/pilferage code

**Description:** The element <`physicalSecurityPilferageCode`> is used to indicate the degree of security or pilferage risk associated with the item.

**Markup element:** <`physicalSecurityPilferageCode`> (O)

**Attributes:**

– `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– list of allowable values for the element <physicalSecurityPilferageCode>

**Markup example:**

Refer to Para 4.

2.5.5.8 Calibration marker

**Description:** The element <calibrationMarker> is used to identify items that require calibration. This element should be set to "1" if an item requires calibration.

**Markup element:** <calibrationMarker> (O)

**Attributes:**

– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

**2.5.6 NATO stock number (NSN)**

**Description:** The element <natoStockNumber> is used to contain the NATO (or NSN for the CSN.

**Markup element:** <natoStockNumber> (O)

**Attributes:**

– id (O), the identifier of the <natoStockNumber> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– natoSupplyClass (O).. This optional attribute is used to contain the NATO Supply Class (NSC).
– natoCodificationBureau (O). This optional attribute is used to contain the first two digits of the NATO Item Identification Number (NIN) in the format of the NCB.
– natoItemIdentCodeCore (O). This optional attribute is used to contain the third to ninth digit of the NIN.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– <fullNatoStockNumber> (O), this element is used to store a full NSN
– <refs> (O). Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

### 2.5.7 Part location data

**Description:** The element <partLocationSegment> is used to identify a S2000M Part Location Data Segment (CBS).

**Markup element:** <partLocationSegment> (O)

ICN-S1000D-A-030905-D-F6117-00006-A-001-01

*Fig 6 Element <partLocationSegment>*

**Attributes:**

– None

**Child elements:**

– <attachStoreShipPart> (O). Refer to Para 2.5.7.1.
– <notIllustrated> (O). Refer to Para 2.5.7.2.
– <referTo> (O). Refer to Para 2.5.7.3.
– <selectOrManufactureFromIdent> (O). Refer to Para 2.5.7.4.
– <descrForLocation> (O). Refer to Para 2.5.7.6.

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

#### 2.5.7.1 Attaching storage or shipping part

**Description:** The element <attachStoreShipPart> is used to indicate if an item is an attaching, storage or shipping part using the attribute

**Markup element:** <attachStoreShipPart> (O)

**Attributes:**

- id (O), the identifier of the <attachStoreShipPart> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- attachStoreShipPartCode (M). A value of "1" indicates an attaching part, "2" a storage part and "3" a shipping part. Storage parts are used only when a unit is in storage and shipping parts are used only when a unit is being shipped.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

2.5.7.2 Not illustrated

**Description:** The element <notIllustrated> is used to indicate that an item has not been illustrated. If an item has not been illustrated this element is populated with a hyphen "-".

**Markup element:** <notIllustrated> (O)

**Attributes:**

- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

2.5.7.3 Refer to

**Description:** The element <referTo> is used to contain a reference to multiple IPP or CSN.

**Note**

The next higher assembly and refer for detail values provides a two way link between the two locations that an item has when it appears in the breakdown of one figure and is 'referred out' to a separate figure which is created to present the breakdown of that item.

**Markup element:** <referTo> (O)

**Attributes:**

- id (O), the identifier of the <referTo> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- refType(O), this optional attribute is used to qualify the "refer to" link and should be populated using data from Table 5.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

*Table 5 Refer to types*

| Value | Reason | Meaning |
|---|---|---|
| "nha" | Next higher assembly | Refer to next higher assembly |
| "det" | See for details | Refer for details |
| "equivalent" | Equivalent part | A part that has the same form, fit and function of the original part and performs to the same operating parameters. The parts have the same application |
| "substitute" | Substitute part | A part that has the same form and fit of the original part, but can differ in function or operating parameters. The substitute part is capable of being used under specific conditions or for particular applications and without alteration of the item itself or those adjoining it. Degradation of equipment performance can result when substitute parts are used |
| "attaching" | Attaching part | A part used to attach parts to the product or to each other. |

**Child elements:**

- <initialProvisioningProjectRef>. Refer to Para 2.5.7.3.1.
- <catalogSeqNumberRef> Refer to Para 2.5.7.3.2.

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

*2.5.7.3.1 Refer to IPP*

**Description:** The element <initialProvisioningProjectRef> is used to contain only a reference to another IPP for non-chapterized IPD (in an electronic (IPDP) it mainly will address the first CSN of this referenced IPPN).

**Markup element:** <initialProvisioningProjectRef> (O)

**Attributes:**

- `id` (O), the identifier of the <`initialProvisioningProjectRef`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `initialProvisioningProjectValue` (M), this attribute contains the IPPN of the referenced IPP.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

*2.5.7.3.2 Refer to CSN*

**Description:** The element <`catalogSeqNumberRef`> is used to contain a reference to another CSN.

**Markup element:** <`catalogSeqNumberRef`> (O)

**Attributes:**

- `id` (O), the identifier of the <`catalogSeqNumberRef`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `catalogSeqNumberValue`(M) , used to store a referenced CSN.
- `itemSeqNumberValue` (O) - used to store a referenced ISN.
- `initialProvisioningProjectValue` (O) - used to store a referenced IPPN for non-chapterized CSN references only.
- `responsiblePartnerCompanyCode` (O) - used to store the NSCM (CAGE) of a referenced Responsible Partner Company (RPC)
- `xlink` (O), attributes (`type, href, title, show, actuate`), which are used to manage the W3C Xlink attributes.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <`refs`> (O). Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

2.5.7.4 Select or manufacture from identifier

**Description:** The element <selectOrManufactureFromIdent> is used to indicate that an item must be selected to suit specific operating conditions, or that the item can be locally manufactured.

**Markup element:** <selectOrManufactureFromIdent> (O)

**Attributes:**

- id (O), the identifier of the <selectOrManufactureFromIdent> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- selectOrManufactureValue (M) is used to store this information and is set in accordance with Table 6.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

*Table 6 Select or manufacture from*

| Value | Reason | Meaning |
|---|---|---|
| "f" | Select on fit | Applied against items which vary in physical dimension (eg washers, shims, oversize/undersize parts) |
| "t" | Select on test | Applied against items which vary in electrical characteristics (eg resistors, capacitors) |
| "m" | Manufacture from | Applied against items which can be locally manufactured or programmed |
| "r" | Reworked from | Applied against items which can be produced by the reworking of a pre-modified item. Reference to modification instructions is obligatory |
| "p" | Repaired from | Applied against items which can be repaired from special repair parts, repair kits or part kits |

**Child elements:**

- <selectOrManufacture> Refer to Para 2.5.7.5.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- list of allowable values for the element <selectOrManufactureFromIdent>

**Markup example:**

Refer to Para 4.

2.5.7.5 Select or manufacture

**Description:** The element <selectOrManufacture> is used to identify the range of items to be used for the selection, manufacture, rework or repair of an item. Items should be identified using the CSN, figure number and item number or just item number as appropriate.

**Markup element:** <selectOrManufacture> (O)

**Attributes:**

– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

2.5.7.6 Description for location

**Description:** The element <descrForLocation> is used to store a description for the location of the item which complements the description of the item stored in the element <descrForPart>.

**Markup element:** <descrForLocation> (O)

**Attributes:**

– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

**2.5.8 CCS data**

**Description:** The element <applicabilitySegment> is used to identify an S2000M Applicability Segment (CCS).

**Markup element:** <applicabilitySegment> (O)

ICN-S1000D-A-030905-D-F6117-00007-A-001-01

*Fig 7 Element <applicabilitySegment>*

**Attributes:**

– None

**Child elements:**

– <usableOnCodeEquip> Refer to Para 2.5.8.1.
– <usableOnCodeAssy> Refer to Para 2.5.8.2.
– <interchangeability> Refer to Para 2.5.8.3.

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

2.5.8.1 Usable on code equipment

**Description:** The element <usableOnCodeEquip> is used to record the equipment variants and configurations to which the item is applied.

**Markup element:** <usableOnCodeEquip> (O)

**Attributes:**

– id (O), the identifier of the <usableOnCodeEquip> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– list of allowable values for the element <usableOnCodeEquip>

**Markup example:**

Refer to Para 4.

2.5.8.2 Usable on code assembly

**Description:** The element <usableOnCodeAssy> is used to record the assembly variants and configurations variants to which the item is applied.

**Markup element:** <usableOnCodeAssy> (O)

**Attributes:**

- id (O), the identifier of the <usableOnCodeAssy> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- list of allowable values for the element <usableOnCodeAssy>

**Markup example:**

Refer to Para 4.

2.5.8.3 Interchangeability

**Description:** The element <interchangeability> is used to record the interchangeability of two or more items at the same location. This element will only be populated if the element <reasonForSelection> is not set to "0".

**Markup element:** <interchangeability> (O)

**Attributes:**

- id (O), the identifier of the <interchangeability> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- list of allowable values for the element <interchangeability>

**Markup example:**

Refer to Para 4.

### 2.5.9 Category 1 container location

**Description:** The element <categoryOneContainerLocation> is used to record the location at which the data record of an item's category 1 container is held.

**Markup element:** <categoryOneContainerLocation> (O)

**Attributes:**

- id (O), the identifier of the <categoryOneContainerLocation> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- catalogSeqNumberValue(M) - used to store the CSN of the item's category 1 container.
- itemSeqNumberValue(O) - used to store the ISN of the item's category 1 container
- xlink (O), attributes (type, href, title, show, actuate), which are used to manage the W3C Xlink attributes.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

### 2.5.10 CES data

**Description:** The element <locationRcmdSegment> is used to identify an S2000M location recommendation segment (CES). As specified above, this element is only mandatory for S2000M programs.

**Markup element:** <locationRcmdSegment> (O)

**Attributes:**

- None

**Child elements:**

- <locationRcmd> provide information for each location recommendation. Refer to Para 2.5.10.1.

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

2.5.10.1 Location recommendation

**Description:** The element <`locationRcmd` > provides information for each location recommendation

**Markup element:** <`locationRcmd` > (M)

ICN-S1000D-A-030905-D-F6117-00008-A-001-01

*Fig 8 Element <`locationRcmd` >*

**Attributes:**

– None

**Child elements:**

– <`service`>. Refer to Para 2.5.10.2.
– <`sourceMaintRecoverability`>. Refer to Para 2.5.10.3.
– <`modelVersion`>. Refer to Para 2.5.10.4.

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

2.5.10.2 Service

**Description:** The element <`service`> is used to identify the user service to which specific data is applicable. The first two characters of this element should be populated with the user nation code. The third character is project specific.

**Markup element:** <`service`> (M)

**Attributes:**

– `id` (O), the identifier of the <`service`> element. Refer to Chap 3.9.5.2.1.2.
– `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– list of allowed values for the third character of the initial provisioning project

**Markup example:**

Refer to Para 4.

2.5.10.3 Source maintenance and recoverability

**Description:** The element <sourceMaintRecoverability> is used to identify maintenance activities which are performed on an item. The population of this element is in accordance with Table 7.

*Table 7 Source maintenance and recoverability*

| Position | Content |
|---|---|
| 1 and 2 | Source code indicating the means of acquiring the item |
| 3 | Maintenance code indicating the lowest maintenance level allowed to remove, replace or use the item |
| 4 | Maintenance code indicating the lowest maintenance level allowed to repair the item |
| 5 | Recoverability code indicating disposal action to be taken for unserviceable items |
| 6 | Defined by project |

**Markup element:** <sourceMaintRecoverability> (O)

**Attributes:**

– id (O), the identifier of the <sourceMaintRecoverability> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– the allowable values for the sixth character of this code

**Markup example:**

Refer to Para 4.

2.5.10.4 Model version

**Description:** The element <modelVersion> is used to identify the specific version of the equipment to which the item is fitted in this location.

**Markup element:** <modelVersion> (O)

**Attributes:**

- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- modelVersionValue (M) is used to identify the specific version of the equipment to which the item is fitted in this location.

**Child elements:**

- <effectivity> (O) is used to identify a range of units or engines to which the item is fitted in this location.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- list of allowable values for this element

**Markup example:**

Refer to Para 4.

2.5.10.5 Effectivity

**Description:** The element <effectivity> is used to identify a range of units or engines to which the item is fitted in this location.

**Markup element:** <effectivity> (O)

**Attributes:**

- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- list of allowable values for unit/engine numbers

**Markup example:**

Refer to Para 4.

**2.5.11 Reference designator**

**Description:** The element <referenceDesignator> contains a cross reference to parts in wiring diagrams, hydraulic diagrams, etc. It is populated with letters, numbers or symbols as appropriate to the target diagram.

**Markup element:** <referenceDesignator> (O)

**Attributes:**

- id (O), the identifier of the <referenceDesignator> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1
- installationIdent(O), the installation identifier
- contextIdent (O), the context identifier
- manufacturerCodeValue (O), used to indicate the manufacturer CAGE code
- itemOriginator (O), used to indicate the origin of the equipment, eg if an equipment is an aircraft manufacturer equipment or a vendor equipment
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

### 2.5.12 Integrated logistic support number

**Description:** The element <ilsNumber> contains an interdisciplinary cross reference to an integrated logistic support number.

**Markup element:** <ilsNumber> (O)

**Attributes:**

- id (O), the identifier of the <ilsNumber> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

### 2.5.13 Change authority number

**Description:** The element <changeAuthorityNumber> is used to store the change authority number (CAN).

**Markup element:** <changeAuthorityNumber> (O)

**Attributes:**

- `id` (O), the identifier of the <`changeAuthorityNumber`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

### 2.5.14 Non S2000M data

**Description:** The element <`genericPartDataGroup`> is used to store any program specific data.

The current IPD structure strongly relies on the S2000M data organization. For non S2000M programs some specific data cannot be covered by the existing S2000M elements. For that purpose this element will allow the definition and storage of any kind of non-already existing S2000M element within the IPD content.

The IPD team must nevertheless first analyze the correspondence between source data and S2000M elements already addressable thru the current IPD Schema elements. If there is compliance, the existing S2000M element must be used otherwise the new data is placed in this new element with its name and value.

**Markup element:** <`genericPartDataGroup`> (O)

ICN-S1000D-A-030905-D-F6117-00009-A-001-01

*Fig 9 Element <`genericPartDataGroup`>*

**Attributes:**

- None

**Child elements:**

– <genericPartData>. Refer to Para 2.5.14.1.

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

2.5.14.1 Generic Part data

**Description:** The element <genericPartData> is used to identify the specific version of the equipment to which the item is fitted in this location.

**Markup element:** <genericPartData> (M)

**Attributes:**

– genericPartDataName, used to store the Text Element Name (TEI)

**Child elements:**

– <genericPartDataValue>, used to store the element value

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– use of the BREX feature for attribute genericPartDataName

**Markup example:**

Refer to Para 4.

2.5.14.2 Generic Part data value

**Description:** The element <genericPartDataValue> is used to store the non S2000M element value.

**Markup element:** <genericPartDataValue> (M)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

## 2.6 Parts data element mapping

As the IPD Schema can to be used to capture and represent parts lists and IPD initially drawn from a S2000M parts database, Table 8 describes the mapping between the initial S2000M elements (defined through their S2000M TEI) and the IPD Schema elements and attributes.

*Table 8 Parts data element mapping*

| Text element identifier | Data element name | M/O | Mapping to Schema elements/attributes |
|---|---|---|---|
| ASP | Attaching, storage or shipping part | O | `<attachStoreShipPart attachStoreShipPartCode="...">` |
| CAN | Change authority number | O | `<changeAuthorityNumber>...</changeAuthorityNumber>` |
| CMK | Calibration marker | O | `<calibrationMarker>...</calibrationMarker>` |
| CSN | Catalogue sequence number | M | `<catalogSeqNumber catalogSeqNumberValue="..." catalogItemNumber="...">` |
| CTL | Category 1 container location | O | `<categoryOneContainerLocation catalogSeqNumberValue="..." itemSeqNumberValue="...">` |
| DFL | Description for location | O | `<descrForLocation>...</descrForLocation>` |
| DFP | Description for part | M | `<descrForPart>...</descrForPart>` |
| EFY | Effectivity | O | `<effectivity>...</effectivity>` |
| FTC | Fitment code | O | `<fitmentCode fitmentCodeValue="...">` |
| ICN | Information control number | O | `<graphic infoEntityIdent="ICN-...">` |
| ICY | Interchangeability | O | `<interchangeability>...</interchangeability>` |
| ILS | Integrated logistic support number | O | `<ilsNumber>...</ilsNumber>` |
| IND | Indenture | M | `<catalogSeqNumber indenture="...">` |
| IPP | Initial provisioning project number | M | `<initialProvisioningProject initialProvisioningProjectNumber="...">` |
| IPS | Initial provisioning project number subject | M | `<initialProvisioningProject initialProvisioningProjectNumberSubject="...">` |
| ISN | Item sequence number | M | `<itemSeqNumber itemSeqNumberValue="...">` |
| LGE | Language code | M | `<initialProvisioningProject languageCode="...">` |
| MFC | NATO supply code for manufacturers | M | `<manufacturerCode>...</manufacturerCode>` |
| MFM | Select or manufacture from range | O | `<selectOrManufacture>...</selectOrManufacture>` |

| Text element identifier | | Data element name | M/O | Mapping to Schema elements/attributes |
|---|---|---|---|---|
| MOI | | Model identification | M | `<modelIdentCode>...</modelIdentCode>` |
| MOV | | Model version | O | `<modelVersion modelVersionValue="...">` |
| NIL | | Not illustrated | O | `<notIllustrated>` |
| NSN | | NATO stock number | O | Composite data element composed of NSC and NIN |
| | NSC | NATO supply class | M | `<natoStockNumber natoSupplyClass="...">` |
| | NIN | NATO item identification number | O | `<natoStockNumber natoCodificationBureau="..." natoItemIdentNumberCore="...">` |
| PNR | | Part number | M | `<partNumber>...</partNumber>` |
| PSC | | Physical security pilferage code | O | `<physicalSecurityPilferageCode>...</physicalSecurityPilferageCode>` |
| QNA | | Quantity per next higher assembly | M | `<quantityPerNextHigherAssy>...</quantityPerNextHigherAssy>` |
| QUI | | Quantity per unit of issue | O | `<quantityPerUnit>...</quantityPerUnit>` |
| RFD | | Reference designator | O | `<referenceDesignator>...</referenceDesignator>` |
| RFS | | Reason for selection | O | `<reasonForSelection reasonForSelectionValue="..."/>` |

| Text element identifier | Data element name | M/O | Mapping to Schema elements/attributes |
|---|---|---|---|
| RTX | Refer to | O | `<referTo>`<br>`<initialProvisioningProjectRef initialProvisioningProjectValue="...">`<br>or<br>`<initialProvisioningProjectRef initialProvisioningProjectValue="..." responsiblePartnerCompanyCode="...">`<br>or<br>`<catalogSeqNumberRef catalogSeqNumberValue="..." itemSeqNumberValue="...">`<br>or<br>`<catalogSeqNumberRef initialProvisioningProjectValue="..." responsiblePartnerCompanyCode="..." catalogSeqNumberValue="..." itemSeqNumberValue="...">`<br>`</referTo>` |
| SID | Subject identification | M | Composite data element composed of (MFC) and (PNR)<br>`<subjectIdent><manufacturerCode>...</manufacturerCode><partNumber>..</partNumber></subjectIdent>` |
| SMF | Select or manufacture from identifier | O | `<selectOrManufactureFromIdent selectOrManufactureValue ="...">` |
| SMR | Source maintenance recoverability | M | `<sourceMaintRecoverability>...</sourceMaintRecoverability>` |
| SRV | Service | M | `<service>...</service>` |
| STR | Special storage | O | `<specialStorage>...</specialStorage>` |
| UCA | Usable on code assembly | O | `<usableOnCodeAssy>...</usableOnCodeAssy>` |
| UCE | Usable on code equipment | O | `<usableOnCodeEquip>...</usableOnCodeEquip>` |
| UOI | Unit of issue | O | `<unitOfIssue>...</unitOfIssue>` |
| UOM | Unit of measure | O | `<unitOfIssueQualificationSegment unitOfMeasure="...">` |

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**CSN codification**. The codes used to make up the CSN are based on the SNS. The structure and rules for the SNS and CSN must be agreed at the start of the project. Refer to Para 2.4.

**Note**

Due to a potential mismatch between the S2000M fixed length CSN definition and the flexible data module code SNS structure, the project or the organization must clearly define these conversion rules.

**Hotspots mechanism**. The project or the organization must decide if the generic hotspots mechanism is addressed within the IPD data module content. Refer to Para 2.4.2.

**Use of the attribute `applicRefIds`**. For S2000M programs, the MOV and EFY will still be stored under the CES data (as defined below) as it reflects the corresponding elements within the S2000M database. Nevertheless, for non-S2000M programs, a choice is given to allow either the use of S2000M applicability structure or S1000D applicability structure. Refer to Para 2.5.

**Reason for selection**. The project or the organization must decide the list of allowable values for the attribute `selectOrManufactureValue`. Refer to Para 2.5.1.

**Unit of measure**. The project or the organization must decide the list of allowable values for the attribute `unitOfMeasure`. When the IP data modules are created from S2000M, the list of allowed UOM values must contain those defined in the data element definition in S2000M. When S2000M is used, it is strongly recommended that the S2000M UOM values are used throughout the project. Refer to Para 2.5.5.4.

**Physical security**. The project or the organization must decide the list of allowable values for the element <`physicalSecurityPilferageCode`>. When S2000M is used, the list must be as stated in the Data Element Definition for the S2000M element PSC. Refer to Para 2.5.5.7.

**Select or manufacture from range**. The project or the organization must decide the list of allowable values for the element <`selectOrManufactureFromIdent`>. Refer to Para 2.5.3.

**Usable on code equipment**. The project or the organization must decide the list of allowable values for the element <`usableOnCodeEquip`>. When S2000M is used, the list must be as stated in the Data Element Definition for the S2000M element UCE. Refer to Para 2.5.8.1.

**Usable on code assembly**. The project or the organization must decide the list of allowable values for the element <`usableOnCodeAssy`>. When S2000M is used, the list must be as stated in the Data Element Definition for the S2000M element UCA. Refer to Para 2.5.8.2.

**Interchangeability**. The project or the organization must decide the list of allowable values for the element <`interchangeability`>. When S2000M is used, the list must be as stated in the Data Element Definition for the S2000M element ICY. Refer to Para 2.5.8.3.

**Service**. The project or the organization must decide must decide a list of allowed values for the third character of the initial provisioning project. Refer to Para 2.5.10.2.

**Source maintenance and recoverability**. The project or the organization must decide the allowable values for the sixth character of this code. Refer to Para 2.5.10.3.

**Model version**. The project or the organization must decide the list of allowable values for the element <`modelVersion`>. When S2000M is used, the list must be as stated in the Data Element Definition for the S2000M element MOV. Refer to Para 2.5.10.4.

**Effectivity**. The project or the organization must decide the list of allowable values for unit/engine numbers. Refer to Para 2.5.10.5.

**The use of the BREX feature for attribute `genericPartDataName`**. The project or the organization must decide whether to use this feature to manage non-S2000M compliant data. Refer to Para 2.5.14.1.

# 4 Examples

## 4.1 Refer to

A reference from one item to two higher assemblies (item 040 part of project 23121101 and item 010 part of project 23121110) will be authored as follows:

```
<referTo refType="nha">
<catalogSeqNumberRef responsiblePartnerCompanyCode="F6117"
initialProvisioningProjectValue="23121101"
catalogSeqNumberValue="040"></catalogSeqNumberRef>
<catalogSeqNumberRef responsiblePartnerCompanyCode="F6117"
initialProvisioningProjectValue="23121110"
catalogSeqNumberValue="010"></catalogSeqNumberRef>
</referTo>
```

A reference from one item to a sub decomposition item (item 050 part of project 23121101 will be authored as follows :

```
<referTo refType="det">
<catalogSeqNumberRef responsiblePartnerCompanyCode="F6117"
initialProvisioningProjectValue="23121101"
catalogSeqNumberValue="040"></catalogSeqNumberRef>
</referTo>
```

If the sub-decomposition item referred is designed on a non chapterized ipd, then a direct reference to the ippn only will be addressed

```
<referTo refType="det">
<initialProvisioningProjectRef
initialProvisioningProjectValue="KZ9990001"></initialProvisionin
gProjectRef>
</referTo>
```

## 4.2 Generic Parts data

Examples of markup examples for the management of ie distributing level (nid), keywords (key) desiccating standard (dhy), storage container (emb) nota (xnt) could be authored as follows:

```
<genericPartDataGroup>
<genericPartData genericPartDataName="nid">
<genericPartDataValue>2</genericPartDataValue></genericPartData>
<genericPartData genericPartDataName="key">
<genericPartDataValue>Bicycle</genericPartDataValue></genericPar
tData>
<genericPartData genericPartDataName="dhy">
<genericPartDataValue>F2408:1-
4UD:02</genericPartDataValue></genericPartData>
<genericPartData genericPartDataName="emb">
<genericPartDataValue>KZ999:LNS10276051</genericPartDataValue>
```

```
</genericPartData>
<genericPartData genericPartDataName="xnt">
<genericPartDataValue>SP</genericPartDataValue></genericPartData
>
</genericPartDataGroup>
```

## 1 General

Wiring data consists of two data module types, each with a dedicated Schema:

- wiring data
- wiring data description

The purpose of the wiring data description data modules is to define the occurrence, the names and the meanings of the elements and attributes that are used in the wiring data modules.

Although the use of the wiring data description data module type is a project or an organization decision, it is recommended that wiring data description data modules are created for the project.

## 2 Wiring data

The content section of wiring data data modules is described in the following chapters:

- Wiring data - Wiring data Schema basic rules. Refer to Chap 3.9.5.2.9.1.
- Wiring data - Wire. Refer to Chap 3.9.5.2.9.2.
- Wiring data - Harness. Refer to Chap 3.9.5.2.9.3.
- Wiring data - Electrical equipment. Refer to Chap 3.9.5.2.9.4.
- Wiring data - Standard parts, Connector. Refer to Chap 3.9.5.2.9.5.
- Wiring data - Standard parts, Distribution part. Refer to Chap 3.9.5.2.9.6.
- Wiring data - Standard parts, Accessory. Refer to Chap 3.9.5.2.9.7.
- Wiring data - Standard parts, Solder sleeve. Refer to Chap 3.9.5.2.9.8.
- Wiring data - Standard parts, Shrink sleeve. Refer to Chap 3.9.5.2.9.9.
- Wiring data - Standard parts, Identification sleeve. Refer to Chap 3.9.5.2.9.10.
- Wiring data - Standard parts, Conduit. Refer to Chap 3.9.5.2.9.11.
- Wiring data - Standard parts, Wire material. Refer to Chap 3.9.5.2.9.12.
- Wiring data - Wiring data description Schema basic rules. Refer to Chap 3.9.5.2.9.13.

## 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use of wiring data description data modules.** The project or the organization must decide whether wiring data description data modules are to be produced or not in order to reflect all decisions concerning elements and attributes of the wiring data Schema.

## 1 General

The wiring data Schema is used to capture and represent the wiring data of the Product such as wire data, harness data, electrical equipment data and standard parts data. The use of the common elements and attributes is detailed in Chap 3.9.5.2.1.

The granularity of a wiring data data module is determined by the application of the SNS and the data module coding guidance given in Chap 5.2.1.4.

## 2 Wiring data Schema basic rules

The wiring data data module Schema holds the major element <wiringData>, which contains the element <wireGroup>, the element <harnessGroup>, the element <electricalEquipGroup> and the element <standardPartGroup> as follows:

- List of wires (<wireGroup>). Refer to Chap 3.9.5.2.9.2.
- List of harnesses (<harnessGroup>). Refer to Chap 3.9.5.2.9.3.
- List of electrical equipment (<electricalEquipGroup>). Refer to Chap 3.9.5.2.9.4.
- List of electrical standard parts (<standardPartGroup>) with the following child elements:
  - List of connectors (<connectorGroup>). Refer to Chap 3.9.5.2.9.5.
  - List of distribution parts (<distributionPartGroup>). Refer to Chap 3.9.5.2.9.6.
  - List of accessories (<accessoryGroup>). Refer to Chap 3.9.5.2.9.7.
  - List of solder sleeves (<solderSleeveGroup>). Refer to Chap 3.9.5.2.9.8.
  - List of shrink sleeves (<shrinkSleeveGroup>). Refer to Chap 3.9.5.2.9.9.
  - List of identification sleeves (<identSleeveGroup>). Refer to Chap 3.9.5.2.9.10.
  - List of conduits (<conduitGroup>). Refer to Chap 3.9.5.2.9.11.
  - List of wire materials (<wireMaterialGroup>). Refer to Chap 3.9.5.2.9.12.

# 1 General

The element <wire> and its child elements are used to capture and represent the wires, which are installed in the Product, and the related information.

# 2 Element <wire> and child elements

**Description:** The element <wire>, within the list of wires element <wireGroup>, contains wire information about the Product's wiring. The wires are the electrical connections between two equipment, different contacts of an equipment, etc. Electrical wires of a system are often bundled into harnesses.

**Markup element:** <wire> (C)

**Attributes:**

- applicRefId (O), defines the applicability of a wire by referencing the element <applic> in the referenced applicability group as described in Chap 3.9.5.3
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O) indicate change in accordance with Chap 3.9.5.2.1.1
- wireState (O), the electrical state of a wire. Normally, wires are divided into physical electrical wires and logical connections, eg the connection of a circuit breaker to the bus bar by a screw. This attribute can have only one of the following values:
  - "active" for wires which are active in one of the systems circuits
  - "stowed" for wires which are stowed (not connected) at least on one end
  - "pigtail" for wires which are connected only at one end to an equipment of the system for measurement purposes
  - "notactiv" for wires which are not active in one of the systems circuits
  - "logconn" for electrical connections in one of the systems circuits which are not realized by a physical wire or do not have wire identification (in some cases called flying leads)
- changeInfo (O), the change information of a wire in connection with the related modification. This attribute can have only one of the following values:
  - "add" for wires which are added to the systems circuits by a modification
  - "delete" for wires which are removed from the systems circuits by a modification
  - "modify" for wires which are modified in the systems circuits by a modification

**Child elements:**

- <wireIdent> (M), the wire identification
- <wireConnection> (M), the wire connection
- <wireInfo> (O), the wire information

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use of the attribute changeInfo="delete" for removed wires
- Use and definition of applicability information for wires

– Use and definition of change attributes for wires

**Markup example:**

```
<wiringData>
<wireGroup>
<wire wireState="active" applicRefId="app-0001">
<wireIdent>...</wireIdent>
<wireConnection>...</wireConnection>
<wireInfo>...</wireInfo>
</wire>
...
</wireGroup>
</wiringData>
```

## 2.1 Wire identification

**Description:** The wire identification element is the unique identifier of a wire in the system.

**Markup element:** <wireIdent> (M)

**Attributes:**

– contextIdent (O), the context identification which is used in combination with the attribute manufacturerCodeValue to ensure the uniqueness of vendor wire data. Context identification contains an identifier, eg the part number of the next higher assembly that has been given to the assembly by the vendor.
– manufacturerCodeValue (O), the identification of the vendor, eg the CAGE code, which is used in combination with the attribute contextIdent to ensure uniqueness of vendor wire data.
– itemOriginator (O), indicates the origin of the wire, ie if a wire is an aircraft manufacturer wire or a vendor wire. Values and their meanings are defined by using the BREX mechanism. Refer to Chap 3.9.6.1 and Chap 4.10

**Child elements:**

– <circuitIdent> (O), the circuit code
– <wireNumber> (M), the wire identification number
– <sectionIdent> (O), the wire section identification

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the attributes contextIdent, manufacturerCodeValue and itemOriginator
– Definition of rules for the population of attribute manufacturerCodeValue in conjunction with the population of element <manufacturerCode>

**Markup example:**

```
<wireIdent contextIdent="PN-AC-12561"
manufacturerCodeValue="F0001" itemOriginator="orig01">
<wireNumber>BT2AA</wireNumber>
</wireIdent>
```

### 2.1.1 Circuit code

**Description:** Projects with electrical wiring often consist of several systems or circuits. If the allocation of a wire to a system must be reflected in the wire identification, the circuit code must be populated with the identifier for this system/circuit. Table 2 gives examples of circuit codes.

*Table 2 Circuit codes*

| Circuit code | System/Circuit |
|---|---|
| AG | Gun system |
| LD | Lighting control |
| YD | Armament control system |

**Markup element:** <circuitIdent> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of circuit codes

### 2.1.2 Wire identification number

**Description:** All wires must have a wire identification number. If there is no further breakdown, by the use of the circuit code element <circuitIdent> and the wire section identification element <sectionIdent>, then the element <wireNumber> must contain the complete wire identification.

If a conductor runs through non-functional breaks, eg a terminal junction module or a splice, the wire identification number must be the same for the two wires, but the section identifications are different.

**Markup element:** <wireNumber> (M)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

– None identified

### 2.1.3 Wire section identification

**Description:** Wires which are connected by non-functional breaks such as connectors, terminal junction modules, splices, etc, often get the same wire identification number and different section identifications. In this case, the wire section identification element must be populated with the identifiers for these different sections.

**Markup element:** <sectionIdent> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the wire section identification
– Definition of the values for the population of element <sectionIdent>

### 2.1.4 Markup examples

2.1.4.1 Wire identification example using circuit code and section identification
The following markup example shows the wire identification for section AA of wire number 0486 within the armament control system (YD).

```
<wireIdent>
<circuitIdent>YD</circuitIdent>
<wireNumber>0486</wireNumber>
<sectionIdent>AA</sectionIdent>
</wireIdent>
```

2.1.4.2 Wire identification example without using circuit code and section identification
The following example shows the markup of wire W5250-2023B-24 that is installed in the panel with the part number P1650-411, supplied by the vendor with the identification F2345:

```
<wireIdent contextIdent="P1650-411"
manufacturerCodeValue="F2345" itemOriginator="orig02">
<wireNumber>W5250-2023B-24</wireNumber>
</wireIdent>
```

## 2.2 Wire connection

**Description:** The wire connection element contains connection information for the two ends of a wire. In special cases, eg wires with wireState = "pigtail" or "notactiv", only the connection of one wire end is used.

**Markup element:** <wireConnection> (M)

**Attributes:**

– None

**Child elements:**

– <fromEquip> (M), the from equipment information
– <toEquip> (O), the to equipment information which must be populated for all wires with two relevant wire ends, otherwise not

**Business rules decisions:**

– None identified

**Markup example:**

```
<wireConnection>
<fromEquip>...</fromEquip>
<toEquip>...</toEquip>
</wireConnection>
```

### 2.2.1 Content model electrical equipment

**Description:** The content model electrical equipment defines the child elements of elements <fromEquip> and <toEquip>, which contain the wire connection information for the two wire ends.

**Markup elements:** <fromEquip> (M) and <toEquip> (O)

**Attributes:**

– None

**Child elements:**

– <referenceDesignator> (M), the reference designator
– <contactInfo> (O), the contact information
– <screenGroup> (O), the list of screens
– <twistGroup> (O), the twist information group
– <wireInstallationCode> (O), the wire installation code

**Business rules decisions:**

– None identified

**Markup example:**

```
<fromEquip>
<referenceDesignator>Sensor</referenceDesignator>
<contactInfo>...</contactInfo>
<screenGroup>...</screenGroup>
</fromEquip>
```

#### 2.2.1.1 Reference designator

**Description:** The reference designator element contains the identification of the electrical equipment to which the wire end is connected. The population of this element must be in accordance with Chap 3.9.5.2.9.4.

**Markup element:** <referenceDesignator> (M)

**Attributes:**

– id (O), the identifier of the markup element. Refer to Chap 3.9.5.2.1.2
– changeType (O), changeMark (O) and reasonForUpdateRefIds (O) indicate change in accordance with Chap 3.9.5.2.1.1
– installationIdent (O), used to achieve uniqueness for multiple occurrence equipment. Multiple occurrence equipment is equipment that is more than once installed in the Product, eg an aircraft, and have allocated the same reference designator for all installation instances.
– contextIdent (O), manufacturerCodeValue (O) and itemOriginator (O). Refer to Para 2.1
– securityClassification (O), commercialClassification (O) and caveat (O), used for security and restrictive markings in accordance with Chap 3.6

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the reference designator element <referenceDesignator> and the related attributes to achieve uniqueness of vendor equipment

**Markup example:**

```
<referenceDesignator installationIdent="d1">Diode
</referenceDesignator>
```

2.2.1.2 Contact information

**Description:** The contact information element contains child elements that identify the contact to which the wire end is connected.

**Markup element:** <contactInfo> (O)

**Attributes:**

– None

**Child elements:**

– <contact> (O), the contact identification
– <wireConnectionCode> (O), the wire connection code
– <networkAnalysisCode> (O), the network analysis code
– <groupCode> (O), the group code

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the contact information element <contactInfo>

**Markup example:**

```
<contactInfo>
<contact contactIdent="GND"/>
<wireConnectionCode>...</wireConnectionCode>
<networkAnalysisCode>01</networkAnalysisCode>
<groupCode>G1-</groupCode>
</contactInfo>
```

*2.2.1.2.1 Contact identification*

**Description:** This element describes the contact identification by its attributes. Normally, wires are connected to contacts with designation identification. If not, the contact designation identification attribute contactIdent has no value for those contacts where at least one of the other attributes is used. If none of the attributes is used, the element <contact> must not be used at all.

**Markup element:** <contact> (O)

**Attributes:**

– contactIdent (M), contains the identification of the contact, eg "A", "1"
– contactFunction (O), contains the functional identification of the contact, eg "ON", "OFF", "BRIGHT" or "DIM"
– contactType (O), contains the type of the contact, eg "BASE", "PIN", "SOCKET", "COAX" or "BUS"

- `connectedFlag` (O), gives the information whether the wire is connected to the contact or not (stowed wires). The value "`0`" (no) indicates that the wire is not connected to the contact. The value "`1`" (yes) indicates that the wire is connected to the contact.
- `contactPartNumber` (O), contains the part number of the contact to which the wire end is connected
- `wireInstallationDirection` (O), contains direction information for non-symmetric wires

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use of the contact identification element <`contact`> and its attributes

**Markup examples:**

```
<contact contactIdent="1" contactFunction="BRIGHT"/>
<contact contactIdent="A1" contactType="(BASE)"/>
<contact contactIdent="1" contactPartNumber="(JN)1003S-12"/>
<contact contactIdent="AA1" wireInstallationDirection="A"/>
```

*2.2.1.2.2 Wire connection code*

**Description:** The wire connection code is used for generic identification of the electrical potential to which a wire end is connected. This can be the basis to arrange the ends of the wires in a specific order for graphical display purposes and to generate a connection analysis.

**Markup element:** <`wireConnectionCode`> (O)

**Attributes:**

- None

**Child elements:**

- <`screenOrder`> (O), the shielding order information
- <`specialConnection`> (O), the special connections information
- <`electricalPotential`> (C), the electrical potential information
- <`potentialConnectionsOrder`> (O), the potential connections information

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use of the wire connection code element <`wireConnectionCode`> and its child elements

**Markup example:**

```
<wireConnectionCode>
<electricalPotential>
<contactOrderValue>2</contactOrderValue>
</electricalPotential>
</wireConnectionCode>
```

*2.2.1.2.3 Shielding order*

**Description:** The shielding order element <screenOrder> contains an ascending numerical value, which represents the order of the wires connected to an equipment, for graphical presentation of the shielding situation.

**Note**

Screen connections, eg from a screen to the shell of an equipment, must always have a lower value than the wires which are shielded by this screen.

**Markup element:** <screenOrder> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the shielding order element <screenOrder>

**Markup example:**

```
<screenOrder>3</screenOrder>
```

*2.2.1.2.4 Special connections*

**Description:** The special connections element <specialConnection> contains a numerical value and must be used for all wires, that are connected to "special contacts" of an equipment, such as stowed wires and wires connected to the shell of this equipment.

In the graphical presentation, these wires are always, depending on the given value, shown after the wires, which are connected to real contacts of the equipment.

Wires with the wire state value "logconn", which are connected to special contacts, eg when a shield is electrically connected to the shell of a connector by the cable clamp that is represented by the logical connection wire, must not get allocated data in the special connections element <specialConnection>.

**Markup element:** <specialConnection> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the values for the special connections element <specialConnection>

**Markup example:**

```
<specialConnection>100</specialConnection>
```

*2.2.1.2.5 Electrical potential*

**Description:** The electrical potential element <electricalPotential> is used to order the wires based on project or organization specific rules, using the relation to termination module, block and shunt or pole and position, and the contact identification.

There are two different cases for coding of the electrical potential information:

- Equipment without internal logic
- Equipment with internal logic

Equipment without internal logic. Equipment, such as connectors, earth bolts etc do not have an internal logic. The ascending values in the contact order child element <contactOrderValue> represent the order of the equipment contacts to facilitate graphical presentation and connection analysis. Contacts of the equipment to which no physical wire is connected are included by wires with the wire state value "notactiv". For equipment without internal logic, the termination module grouping child element <terminationModuleGroupingValue>, the block grouping child element <blockGroupingValue> and the shunt grouping child element <shuntGroupingValue> must not be used.

Equipment with internal logic. Equipment, such as switches, relays and terminal junction modules have an internal logic. That means, the equipment has internal connections, which connect different contacts of the equipment electrically. For switches and relays, these electrical connections depend on the switch/relay position. The internal electrical connections are the basis for the coding of the termination module grouping child element <terminationModuleGroupingValue>, the block grouping child element <blockGroupingValue> and the shunt grouping child element <shuntGroupingValue>. Examples for the population of these elements are given in Para 4.1.

**Markup element:** <electricalPotential> (M)

**Attributes:**

- None

**Child elements:**

- <terminationModuleGroupingValue> (O), used for contacts that belong to the same module of a termination module assembly
- <blockGroupingValue> (O), used for contacts that belong to the same block of a termination module assembly or the same pole of a switch or a relay
- <shuntGroupingValue> (O), contains an identical alphanumerical value for all contacts that belong to the same shunt/bus of a termination module or the same position of a switch or a relay
- <contactOrderValue> (O), contains an alphanumerical value that represents the ascending order of the equipment contacts to facilitate graphical presentation and connection analysis. Contacts of the equipment to which no physical wire is connected are included by wires with the wire state value "notactiv".

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use and definition of the child elements of the electrical potential element <electricalPotential>

**Markup example:**

```
<electricalPotential>
<terminationModuleGroupingValue>1
</terminationModuleGroupingValue>
<blockGroupingValue>1</blockGroupingValue>
<shuntGroupingValue>1</shuntGroupingValue>
<contactOrderValue>1</contactOrderValue>
</electricalPotential>
```

*2.2.1.2.6 Termination module grouping information*

**Description:** This element is only used for equipment with internal logic. It provides grouping information for contacts that belong to the same module of a termination module assembly.

It must contain an identical alphanumerical value for all these contacts.

**Markup element:** <terminationModuleGroupingValue> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the termination module grouping element <terminationModuleGroupingValue>

**Markup example:**

```
<terminationModuleGroupingValue>1
</terminationModuleGroupingValue>
```

*2.2.1.2.7 Block grouping information*

**Description:** This element is only used for equipment with internal logic. It provides grouping information for contacts that belong to the same block of a termination module assembly or the same pole of a switch or a relay.

It must contain an identical alphanumerical value for all these contacts.

**Markup element:** <blockGroupingValue> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the block grouping element <blockGroupingValue>

**Markup example:**

```
<blockGroupingValue>1</blockGroupingValue>
```

*2.2.1.2.8 Shunt grouping information*

**Description:** This element is only used for equipment with internal logic. It provides grouping information for contacts that belong to the same shunt/bus of a termination module or the same position of a switch or a relay.

It must contain an identical alphanumerical value for all these contacts.

**Markup element:** <shuntGroupingValue> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the shunt grouping element <shuntGroupingValue>

**Markup example:**

```
<shuntGroupingValue>1</shuntGroupingValue>
```

*2.2.1.2.9 Contact order information*

**Description:** The contact order element <contactOrderValue> is used to order the wire ends, connected to equipment with internal logic, in addition to the termination module, block and shunt grouping elements.

All wires, which are not connected to base contacts of switches and relays, must get values higher than the values of base contacts. In this case, the base contact (supply) will be shown before the different positions of the switch/relay in the graphical presentation of the wires connected to this equipment.

When more than one wire is connected to an electrical potential, all these wires must have the same content in the contact order element <contactOrderValue>.

**Note**

More than one wire can be connected to earth bolts. But also modifications in the wiring and splits in the applicability of the system can cause that more than one wire is connected to the same contact of equipment, because for coding purposes the wires of all applicability ranges and modifications are taken into consideration.

More than one wire can also be connected to data bus contacts. The contact is composed of physically different pins. Therefore, the wire ends that are connected to the physically different pins of the composed contact must get different values in the contact order element <contactOrderValue>.

**Markup element:** <contactOrderValue> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the contact order element <contactOrderValue>

**Markup example:**

```
<contactOrderValue>3</contactOrderValue>
```

2.2.1.2.10 *Potential connections order*

**Description:** This element is used in the situation when more than one wire is connected to an electrical potential, eg an earth bolt. All these wires must have the same value for the electrical potential block grouping information in the wire connection code. In this case, these wires must have ascending numerical values at the potential connections of the wire connection code, which orders the wire to facilitate graphical presentation.

**Markup element:** <potentialConnectionsOrder> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the potential connections order element <potentialConnectionsOrder>

**Markup example:**

```
<potentialConnectionsOrder>2</potentialConnectionsOrder>
```

2.2.1.2.11 *Network analysis code*

**Description:** The network analysis code describes the behavior of the wire end in the network connection analysis in relation to other wires via the equipment. It is based on the behavior of the equipment to which the wire end is connected. This element can be used as the basis for the analysis of electrical connections in a system.

The network analysis code must contain a two-digit numerical value and is used for the analysis of the electrical connections in a system. It defines for every wire end, whether it is a starting point, the end of a connection analysis or whether the analysis is continued via equipment connections, eg connectors, switches etc.

The values given in Table 3 are recommended.

*Table 3 Network analysis codes*

| Value | Meaning for connection analysis |
|---|---|
| 01 | Starting point and end of connection analysis |
| 02 | Starting point, analysis continued via a plug/receptacle connection (transfer point) |
| 03 | Starting point, analysis continued via an equipment connection with internal logic, eg terminal junction modules (transfer point) |
| 04 | Starting point, analysis continued via an equipment connection with internal logic and alternative switch positions, eg switches and relays (transfer point) |

| Value | Meaning for connection analysis |
|---|---|
| 05 | No starting point and end of connection analysis |
| 06 | No starting point, analysis continued at the same equipment |
| 07 | Starting point with special usage (depth of iteration 1) and end of connection analysis |
| 08 | Starting point and end of connection analysis with special usage |
| 11 | Starting point and end of connection analysis for data bus systems (similar to value 01) |
| 12 | Starting point, analysis continued via a plug/receptacle connection (transfer point) for data bus systems (similar to value 02) |
| 17 | Starting point with special usage (depth of iteration 1) and end of connection analysis for data bus systems (similar to value 07) |

**Markup element:** <networkAnalysisCode> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the network analysis code element <networkAnalysisCode>

**Markup example:**

```
<networkAnalysisCode>04</networkAnalysisCode>
```

*2.2.1.2.12 Group code*

**Description:** The group code element <groupCode> indicates the physical grouping of wires connected to the same contact. For example, where multiple wires are connected to a terminal stud using multiple ring terminals, each wire connected to the same ring terminal must have the same group code, eg A. Wires that are connected to the same terminal stud but to another ring terminal must have another group code, eg B. This means that an identical group code indicates wires, which are physically connected to the same ring terminal.

**Markup element:** <groupCode> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the group code for wires that are connected to the same contact

**Markup example:**

```
<groupCode>B</groupCode>
```

2.2.1.3 List of screens

**Description:** The list of screens element <screenGroup> is used as a container for the subordinate screen/shield information elements.

**Markup element:** <screenGroup> (O)

**Attributes:**

– None

**Child elements:**

– <screen> (C), the screen/shield information

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the list of screens element <screenGroup>

**Markup example:**

```
<screenGroup>
<screen>...</screen>
<screen>...</screen>
</screenGroup>
```

*2.2.1.3.1 Screen/shield information*

**Description:** The element <screen> and its attributes contain information of the type of the wire in a shielding situation and the identification of the screen to which the wire end is connected.

**Note**

The term 'shielding situation' is used in this chapter when it is necessary to describe the terminations of screens that shield wires. This information is essential for maintenance personnel in order to enable them to make the correct terminations of screens.

The screen/shield information provides a unique identifier to screens, eg over all screens or screens of a cable, which shield a wire or a cable. When shielded wires are connected to equipment, the ends of their screens are connected to a pin or a chassis of the equipment by using an active wire or by clamping or soldering the screen with the shell as for wiring data with a logical connection. It is also possible that the screen end is left open, which means that there is no connection to any equipment.

It is recommended to populate the element <screen> and the available attributes as follows:

In special cases an over all screen covers shielded wires. For graphical display purposes the attribute screenLevel defines the hierarchy of the screens with two-digit numeric data for screen connections. Inner screens must have lower values, starting with value "01". Shielded wires must have the screen level attribute screenLevel value "00".

The attribute screenType defines the type of wire in the shielding situation with two-digit numeric data. The attribute screenType is used for graphical display purposes. The values given in Table 4 are recommended.

*Table 4 Types of wires in a shielding situation*

| Value | Meaning (Type of wire) |
|---|---|
| 01 | Shielded wires |
| 02 | Virtual screen connections |
| 03 | Connections from a screen to a shell |
| 04 | Connections from a screen to a pin of the equipment (pin screen) |
| 05 | Connections of two screens (screen link) |
| 06 | Connections from a screen to another equipment (screen follower) and PIGTAIL wires to a screen |
| 07 | Connections from a screen to one of the shielded wires |
| 90 | Unshielded wires |
| 99 | Wires, which shielding situation can not be shown |

The attribute `screenStyle` defines the presentation format of a screen. It is only used for screen connections. Shielded wires must have the screen style attribute `screenStyle` value "`00`". If used, the values given in Table 5 are recommended.

*Table 5 Types of screens*

| Value | Meaning (Type of screen) |
|---|---|
| 01 | Normal screens |
| 02 | Screens of data bus cables |
| 03 | Screens of coaxial cables |
| 04 | Outer screens of tri-axial cables |
| 05 | Inner screens of tri-axial cables |

The element <`screen`> itself contains, if applicable, the identification of the screen to which the wire is connected

**Markup element:** <`screen`> (C)

**Attributes:**

- `screenLevel` (O), describes the physical level of the screen in a shielding situation. Outer screens (over all screens) must have higher values than inner screens (screens of cables)
- `screenType` (O), describes the type of the wire in a shielding situation

**Note**

The attribute `screenType` describes the connection type of a wire (normally on both ends of the screen, a wire is connected to, eg pin screens), connected to this screen or the shielded wire itself. Screen information for the complete screen is provided in the element <`wireInfo`>. Therefore it is recommended not to use the screen type attribute `screenType` in this context.

– `screenStyle` (O), describes the style for the graphical presentation of the screen in a shielding situation

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <`screen`> and its attributes

**Markup example:**

```
<screen screenLevel="01" screenType="03" screenStyle="01">
SCT1</screen>
```

2.2.1.4 Twisting of twisted wires

**Description:** The twisting of twisted wires element <`twistGroup`> is used as a container for the subordinate twist information elements.

**Markup element:** <`twistGroup`> (O)

**Attributes:**

– None

**Child elements:**

– <`twist`> (C), the twist information

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the twisting of twisted wires element <`twistGroup`>

**Markup example:**

```
<twistGroup>
<twist>...</twist>
<twist>...</twist>
</twistGroup>
```

*2.2.1.4.1 Twist information*

**Description:** The element <`twist`> and its attribute `twistingType` contain information about the twisting of a wire. The element <`twist`> must contain all twist information of the wire. The available twisting type attribute `twistingType` specifies the type of twisting in coded form. Twist information can be different on both sides of a wire. The element <`twist`> must contain the twist information on this side of the wire.

Table 6 gives the recommended codes for twisting types.

*Table 6 Twist type codes*

| Twisting type code | Twisting type |
|---|---|
| 1 | Twisting of multi-core cables |
| 2 | Manually twists |

| Twisting type code | Twisting type |
|---|---|
| 3 | Manually twists of already twisted wires |

**Markup element:** <twist> (C)

**Attributes:**

– twistingType (O), specifies the type of twisting

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Definition of the element <twist>
– Use and definition of the attribute twistingType

**Markup example:**

The following markup example shows the twisting of a wire that is manually twisted with one or more other wires. All wires that are twisted together have the same twist identifier T%CM0005AA.

```
<twist twistingType="2">T%CM0005AA</twist>
```

2.2.1.5 Wire installation code

**Description:** This element contains the information for preparation and finishing of the wire for connection purposes.

**Markup element:** <wireInstallationCode> (O)

**Attributes:**

– None

**Child elements:**

– <preparationInfo> (O), the wire preparation information
– <finishingInfo> (O), the wire finishing information

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the wire installation code element <wireInstallationCode>

**Markup example:**

The following markup example shows the preparation information for a wire end. It shows the preparation instruction in coded form PRE609 and gives a reference to the instruction sheet.

```
<wireInstallationCode>
<preparationInfo>
<instructionIdent>PRE609</instructionIdent>
<refs>
<dmRef>
<dmRefIdent>
```

```
<dmCode modelIdentCode="1B" systemDiffCode="B" systemCode="20"
subSystemCode="9" sub-subsystemCode="0" assyCode="16"
disassyCode="09" disassyCodeVariant="A" infoCode="010"
infoCodeVariant="A" itemLocationCode="D"/>
</dmRefIdent>
</dmRef>
</refs>
</preparationInfo>
</wireInstallationCode>
```

2.2.1.5.1 *Content model preparationInfo/finishingInfo*

**Description:** For wires, the content model preparationInfo/finishingInfo defines the child elements <preparationInfo> and <finishingInfo>.

**Markup elements:** <preparationInfo> (O) and <finishingInfo> (O)

**Attributes:**

– None

**Child elements:**

– <instructionIdent> (O), the wire preparation or finishing information in coded form
– <refs> (O), used for references to detailed instructions for preparation or finishing of a wire

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the wire preparation information element <preparationInfo> and the wire finishing information element <finishingInfo>

**Markup example:**

```
<preparationInfo>
<instructionIdent>...</instructionIdent>
<refs>...</refs>
</preparationInfo>
```

2.2.1.5.2 *Preparation/finishing information identification*

**Description:** The element <instructionIdent> gives wire preparation or finishing information in coded form.

**Markup element:** <instructionIdent> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the wire preparation or finishing information encoding element <instructionIdent>

**Markup example:**

```
<instructionIdent>PRE609</instructionIdent>
```

*2.2.1.5.3 References*

**Description:** The element <refs> contains links to other parts of the project's publications, which give the detailed instructions for preparation or finishing of a wire. References must be populated in accordance with Chap 3.9.5.2.1.2.

**Markup element:** <refs> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Chap 3.9.5.2.1.2

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the references element <refs>

## 2.3 Wire information

**Description:** The wire information element <wireInfo> contains child elements, which describe properties of the wire and other information related to the complete wire.

**Markup element:** <wireInfo> (O)

**Attributes:**

– None

**Child elements:**

– <wireCode> (O), the wire code
– <partNumber> (O), the wire part number
– <harnessIdent> (O), the identification of the harness to which the wire belongs
– <wireSeqNumber> (O), the wire sequential number
– <circuitIdent> (O), the circuit code. Refer to Para 2.1.1
– <sectionIdent> (O), the wire section identification. Refer to Para 2.1.3
– <screenGroup> (O), the list of screens. Refer to Para 2.2.1.3
– <twistGroup> (O), the twisting information of twisted wires. Refer to Para 2.2.1.4
– <coaxialCableFlag> (O), the coaxial information
– <triaxialCableFlag> (O), the tri-axial information
– <emcCode> (O), the electromagnetic compatibility (EMC) code
– <length> (O), the wire length
– <wireColor> (O), the wire color
– <signalInfo> (O), the wire signal information
– <responsiblePartnerCompany> (O), the company or the organization, which is responsible for the wire data
– <routing> (O), the wire routing information
– <wireRoute> (O), the wire route lane code
– <restriction> (O), the wire restriction information
– <nextHigherAssy> (O), the identification of the next higher assembly

– <functionalDescrRef> (O), the functional description reference
– <illustrationRef> (O), the reference to circuit or wiring diagrams

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the wire information element <wireInfo> and its child elements

**Markup example:**

```
<wireInfo>
<harnessIdent>2309VB</harnessIdent>
<wireColor>B</wireColor>
<signalInfo>115V AC, 400Hz</signalInfo>
</wireInfo>
```

### 2.3.1 Wire code

**Description:** This element gives information on the type of a wire and its gauge.

**Markup element:** <wireCode> (O)

**Attributes:**

– None

**Child elements:**

– <wireType> (C), the wire type
– <wireGauge> (O), the wire gauge

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the wire code element <wireCode> and its child element <wireGauge>

**Markup example:**

```
<wireCode>
<wireType>CH</wireType>
</wireCode>
```

#### 2.3.1.1 Wire type

**Description:** This element gives information on the type of a wire. Normally, the wire type is defined in coded form. Table 7 gives examples for the coding of wire types.

*Table 7 Wire type codes*

| Wire type code | Wire type |
|---|---|
| CH | 600V, 150°C, Single, Nickel-Coated Copper |
| PC | 600V, 150°C, Multi-Core, 2 cores, Overall Sheathed, Nickel-Coated Copper |
| QC | 600V, 150°C, Multi-Core, 3 cores, Overall Sheathed, Nickel-Coated Copper |

**Markup element:** <wireType> (C)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Definition of the wire type content/codes

**Markup example:**

```
<wireType>QC</wireType>
```

2.3.1.2 Wire gauge

**Description:** This element contains the gauge of a wire. The measure type is given in the gauge type attribute `wireGaugeType`.

**Markup element:** <`wireGauge`> (O)

**Attributes:**

– `wireGaugeType`> (C), the type of measure for the wire gauge. This attribute must have one of the following values:
  - "`proj`" for wires which gauge type is measured in a project or an organization specific unit
  - "`awg`" for wires which gauge type is measured in accordance with the American Wire Gauge units
  - "`mt`" for wires which gauge type is measured in a metric unit

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<wireGauge wireGaugeType="awg">006</wireGauge>
```

**2.3.2 Wire part number**

**Description:** The wire part number element <`partNumber`> contains the project specific part number of a wire. If applicable, the properties of a wire with a specific part number are given in the wire material section of the standard parts, refer to Chap 3.9.5.2.9.12. The part number is then the unique identifier. This element must be populated in accordance with Chap 3.9.5.1.

**Markup element:** <`partNumber`> (O)

**Attributes:**

– `id` (O), the identifier of the markup element. Refer to Chap 3.9.5.2.1.2
– `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O) indicate change in accordance with Chap 3.9.5.2.1.1
– `securityClassification` (O), `commercialClassification` (O) and `caveat` (O), used for security and restrictive markings in accordance with Chap 3.6

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the wire part number

**Markup example:**

```
<partNumber>JN1018QC020</partNumber>
```

### 2.3.3 Harness identification

**Description:** The harness identification element <harnessIdent> contains the identification of the harness to which the wire belongs. For more detailed information about the population of this element, refer to Chap 3.9.5.2.9.3.

**Markup element:** <harnessIdent> (O)

**Attributes:**

– contextIdent (O), manufacturerCodeValue (O) and itemOriginator (O), used to further qualify the harness identification. Refer to Chap 3.9.5.2.9.3

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the harness identification for a wire

**Markup example:**

```
<harnessIdent>1109VB</harnessIdent>
```

### 2.3.4 Wire sequential number

**Description:** The wire sequential number element <wireSeqNumber> contains the sequential number of a wire, which can be part of the entire wire identification.

**Markup element:** <wireSeqNumber> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the wire sequential number as part of the wire information section

**Markup example:**

The following markup example shows a wire with the identification W0237-0161-24B. The sequential number of the wire (0161), eg in the harness, is given in element <wireSeqNumber>.

```
<wire wireState="active">
<wireIdent>
```

```
<wireNumber>W0237-0161-24B</wireNumber>
</wireIdent>
...
<wireInfo>
<wireSeqNumber>0161</wireSeqNumber>
</wireInfo>
...
</wire>
```

### 2.3.5 Circuit code

**Description:** For projects that do not use the circuit code of a wire in the identification of the wire itself, the circuit code element <circuitIdent> is additionally available in the wire information element <wireInfo>.

**Markup element:** <circuitIdent> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the circuit code in the wire information section

**Markup example:**

```
<circuitIdent>234</circuitIdent>
```

### 2.3.6 Wire section identification

**Description:** For projects that do not use the wire section identification in the identification of the wire itself, the wire section identification element <sectionIdent> is additionally available in the wire information element <wireInfo>.

**Markup element:** <sectionIdent> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the wire section identification in the wire information section

**Markup example:**

```
<sectionIdent>567</sectionIdent>
```

### 2.3.7 List of screens

**Description:** The list of screens element <screenGroup> contains the subordinate screen/shield information elements. Refer to Para 2.2.1.3.

### 2.3.8 Twisting of twisted wires

**Description:** The twisting of twisted wires element <twistGroup> contains the subordinate twist information elements. Refer to Para 2.2.1.4.

### 2.3.9 Coaxial information

**Description:** The coaxial information element <coaxialCableFlag> identifies coaxial cables. In many cases, a coaxial cable is indicated by the letter "Y" in the element content.

**Markup element:** <coaxialCableFlag> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the coaxial information in the wire information section

**Markup example:**

```
<coaxialCableFlag>Y</coaxialCableFlag>
```

### 2.3.10 Tri-axial information

**Description:** The element <triaxialCableFlag> identifies tri-axial cables. In many cases, a tri-axial cable is indicated by the letter "Y" in the element content.

**Markup element:** <triaxialCableFlag> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the tri-axial information in the wire information section

**Markup example:**

```
<triaxialCableFlag>Y</triaxialCableFlag>
```

### 2.3.11 Electromagnetic compatibility code

**Description:** The electromagnetic compatibility (EMC) code element <emcCode> identifies the EMC classification of a wire.

Normally, the EMC classification is defined in coded form. Table 8 gives examples for the coding of EMC classifications.

*Table 8 EMC codes*

| EMC code | EMC classification |
|---|---|
| E | Emissive wire |
| S | Susceptible wire |

**Markup element:** <emcCode> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the EMC classification and coding in the wire information section

**Markup example:**
The following markup example shows the EMC code of an emissive wire (EMC-code = E).

```
<emcCode>E</emcCode>
```

### 2.3.12 Length information

**Description:** The length information element <length> contains the length of a wire. It is recommended to specify in the length type attribute wireLengthType, whether the length information gives the design length, the real length of the wire or a critical length.

**Markup element:** <length> (O)

**Attributes:**

– unitOfMeasure (O), the unit of measure for the wire length
– wireLengthType (O), the type of wire length information. The following values are available:
  - "critical", indicates that the new wire must have exactly this defined length when a wire change is performed. Otherwise, the data delivered through the wire will not be accurate
  - "estimated", indicates that the wire length corresponds with the cut length without any constraints to the final length (after installation of the wire)
  - "final", indicates that the wire length corresponds with the length after installation of the wire

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the wire length, the type of length information and the unit of measure

**Markup example:**
The following markup example shows the length information of a wire with an estimated length of 2150 millimeter.

```
<length unitOfMeasure="mm" wireLengthType="estimated">2150
</length>
```

### 2.3.13 Color information

**Description:** The color information element <wireColor> identifies the color of a wire. Normally, the color information is defined in coded form. Table 9 gives examples for the coding of color information.

*Table 9 Color codes*

| Color code | Color of the wire sheathing |
|---|---|
| W | White |
| Y | Yellow |
| R | Red |
| G | Green |
| B | Blue |
| BK | Black |

**Markup element:** <wireColor> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of color information in the wire information section

**Markup example:**

The following markup example shows the color information of a red sheathed wire.

```
<wireColor>R</wireColor>
```

### 2.3.14 Signal information

**Description:** The signal information element <signalInfo> contains information about the signals on a wire. This can be the signal name, the effective voltage, the effective current or the waveform of the signal.

**Markup element:** <signalInfo> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of signal information in the wire information section

**Markup example:**

The following markup example shows the information for a signal on the wire, which is specified as a 115 Volt alternating current with a frequency of 400Hz.

```
<signalInfo>115V AC, 400Hz</signalInfo>
```

### 2.3.15 Responsible partner company

**Description:** The responsible partner company element <responsiblePartnerCompany> indicates the company or the organization, which is responsible for the wire data. This element must be populated in accordance with Chap 3.9.5.1.

**Markup element:** <responsiblePartnerCompany> (O)

**Attributes:**

– id (O), the identifier of the markup element. Refer to Chap 3.9.5.2.1.2
– enterpriseCode (O), the CAGE code of the responsible company or organization

**Child elements:**

– <enterpriseName> (O), the name of the responsible company or organization

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of responsible partner company information in the wire information section

**Markup example:**

The following markup example shows the responsible partner company information of a wire. The responsible partner company is indicated by its CAGE code.

```
<responsiblePartnerCompany enterpriseCode="K0999"/>
```

#### 2.3.15.1 Responsible partner company name

**Description:** The responsible partner company name element <enterpriseName> gives the name of the company or the organization, which is responsible for the data. This element must be populated in accordance with Chap 3.9.5.1.

**Markup element:** <enterpriseName> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the responsible partner company name element <enterpriseName>

**Markup example:**

```
<enterpriseName>Amphenol Ltd</enterpriseName>
```

**2.3.16 Routing**

**Description:** The element <routing> contains routing information of a wire via clipping points and special components, eg current transformers, panels or bungs, through which wires pass.

**Markup element:** <routing> (O)

**Attributes:**

– None

**Child elements:**

– <clippingPoint> (O), the clipping point information for a wire
– <feedThru> (O), the information about the equipment through which a wire passes

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the routing information element <routing> and its subordinate information in the wire information section

**Markup example:**

```
<routing>
<clippingPoint>...</clippingPoint>
<clippingPoint>...</clippingPoint>
<feedThru>...</feedThru>
</routing>
```

2.3.16.1 Clipping point information

**Description:** The clipping points of a wire that fasten it to the structure of an aircraft, an equipment etc, are listed in the <clippingPoint> elements. If used, every clipping point must be populated in exactly one of the <clippingPoint> elements, ie the clipping point identification contains one clipping point that fastens the wire to the structure.

**Markup element:** <clippingPoint> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the clipping point identification in the wire information section

**Markup example:**

```
<clippingPoint>271-11</clippingPoint>
```

2.3.16.2 Feed-through information

**Description:** If a wire passes through equipment, eg a current transformer, this is identified by using the feed-through element <feedThru>.

**Markup element:** <feedThru> (O)

**Attributes:**

– holeIdent (O), the hole identifier

**Child elements:**

– <referenceDesignator> (C), the identification of the equipment through which a wire passes. Refer to Para 2.2.1.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the feed-through information including its attributes

**Markup example:**

The following markup example shows a wire that passes through the hole with the identification '3' of equipment '42XU4T'.

```
<feedThru holeIdent="3">
<referenceDesignator>42XU4T</referenceDesignator>
</feedThru>
```

**2.3.17 Wire route lane code**

**Description:** The element <wireRoute> contains lane codes for wires, which belong to a primary system and must be given a routing apart from other wires of the system.

**Markup element:** <wireRoute> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of wire route lane codes in the wire information section

**Markup example:**

The following markup example shows a wire that belongs to lane 'L1'.

```
<wireRoute>L1</wireRoute>
```

**2.3.18 Wire restriction**

**Description:** The wire restriction information element <restriction> contains restrictions concerning a wire.

**Markup element:** <restriction> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of wire restrictions in the wire information section

### 2.3.19 Next higher assembly

**Description:** For wires that are part of a physical or logical assembly, eg a box and/or a panel, the next higher assembly element <nextHigherAssy> can be used to identify this equipment.

**Markup element:** <nextHigherAssy> (O)

**Attributes:**

– None

**Child elements:**

– <referenceDesignator> (C), the identification of the physical or logical assembly to which the wire belongs. Refer to Para 2.2.1.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the next higher assembly element <nextHigherAssy> in the wire information section

**Markup example:**

The following markup example shows a wire that is installed in the next higher assembly 231VU.

```
<nextHigherAssy>
<referenceDesignator>231VU</referenceDesignator>
</nextHigherAssy>
```

### 2.3.20 Functional description reference

**Description:** The functional description reference element <functionalDescrRef> contains references to other parts of the electrical system publications for further information about a wire, eg a description of how it is made and its function. References must be populated in accordance with Chap 3.9.5.2.1.2.

**Markup element:** <functionalDescrRef> (O)

**Attributes:**

– None

**Child elements:**

– <refs> (C), the functional description reference information. Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of functional description references in the wire information section

### 2.3.21 Illustration reference

**Description:** The illustration reference element <illustrationRef> contains references to other parts of the electrical system publications that contain wiring illustrations. Such an illustration can show circuit or wiring diagrams. References must be populated in accordance with Chap 3.9.5.2.1.2.

**Markup element:** <illustrationRef> (O)

**Attributes:**

– None

**Child elements:**

– <refs> (C), the illustration reference information. Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of illustration references in the wire information section

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use of the attribute changeInfo="delete" for removed wires**. The project or the organization must decide whether the attribute changeInfo="delete" is used on element <wire> for removed wires or not. Refer to Para 2.

**Use and definition of applicability information**. The project or the organization must decide the use and the definition of applicability information for wires. It is strongly recommended to define the wire applicability precisely and populate the elements and attributes in accordance with the project or the organization specific rules. It is recommended to use at least the version and version number information given in the products cross-reference table. Wires with modifications must in addition use the information given in the conditions cross-reference table. Refer to Para 2.

**Use and definition of change attributes**. The project or the organization must decide the use and the definition of change attributes for wire data. Refer to Para 2.

**Use of the element <wireIdent>**. The project or the organization must decide the use and the definition of the context identification attribute contextIdent, the manufacturer attribute manufacturerCodeValue and the originator attribute itemOriginator. It is recommended to apply the same rules for the population of the attribute manufacturerCodeValue, which are defined for the element <manufacturerCode> that is used in several contexts of wiring data. Refer to Para 2.1.

**Use of the element <circuitIdent>**. The project or the organization must decide the use and the definition of circuit codes. If applicable, the circuit codes must be specified and the element <circuitIdent> contains only specified codes. Examples of circuit codes are given in Table 2. Refer to Para 2.1.1 and Para 2.1.2.

**Use of the element <sectionIdent>**. The project or the organization must decide the use and the definition of the section identification. The values for population of the element <sectionIdent> must be defined in project or organization specific rules. Refer to Para 2.1.3 and Para 2.1.2.

**Use of the element <referenceDesignator>**. The project or the organization must define the use of the reference designator element <referenceDesignator> and the related attributes to achieve uniqueness of vendor equipment. Refer to Para 2.2.1.1.

**Use of the element <contactInfo>**. The project or the organization must define the use of the contact information element <contactInfo>.

**Use of the element <contact>**. The project or the organization must decide the use and the definition of the contact identification element <contact> and its attributes. Refer to Para 2.2.1.2.1.

**Use of the element <wireConnectionCode>**. The project or the organization must decide the use and the definition of the child elements of the wire connection code element <wireConnectionCode>. It is recommended to populate the child elements of the wire connection code as described in Para 2.2.1.2.2.

**Use of the element <networkAnalysisCode>**. The project or the organization must decide the use and the definition of the network analysis code. Examples of network analysis codes are given in Table 3. Refer to Para 2.2.1.2.11.

**Use of the element <groupCode>**. The project or the organization must decide the use and the definition of group codes for wires that are connected to the same contact. If used, the project or the organization must define the use of the group code for all situations similar to the connection of wires to a stud via ring terminals. Refer to Para .

**Use of the element <screenGroup>**. The project or the organization must decide the use and the definition of the list of screens and subordinate screen/shield information. Refer to Para 2.2.1.3.

**Use of the element <twistGroup>**. The project or the organization must decide the use and the definition of element <twistGroup> and element <twist> including its attribute twistingType. Refer to Para 2.2.1.4.

**Use of the element <instructionIdent>**. The project or the organization must decide and define the use of the element <instructionIdent> as subordinate information of installation preparation and finishing installation of a wire. If used, it is recommended to populate the element <instructionIdent> consistently. Refer to Para 2.2.1.5.

**Use of the element <refs>**. The project or the organization must decide the use and the definition of references to detailed instructions for preparation or finishing of a wire. If used, references must be given consistently. Refer to Para 2.2.1.5.3.

**Use of the element <wireInfo>**. The project or the organization must decide the use and the definition of the wire information section. Refer to Para 2.3.

**Use of the element <wireCode>**. The project or the organization must decide the use and the definition of the wire code element <wireCode> and its child elements. Refer to Para 2.3.1.

**Use of the element <wireType>**. The project or the organization must decide the use and the definition of wire types. Examples of wire type codes are given in Table 7. Refer to Para 2.3.1.1.

**Use of the element <partNumber>**. The project or the organization must decide the use and the definition of wire part numbers. Refer to Para 2.3.2.

**Use of the element <harnessIdent>**. The project or the organization must decide the use and the definition of harness identification for a wire. Refer to Chap 3.9.5.2.9.3 and Para 2.3.3.

**Use of the element <wireSeqNumber>**. The project or the organization must decide the use and the definition of the wire sequential number. The wire sequential number must be used when the entire wire identification including its sequential number is not given in the wire number element <wireNumber>. For projects that hold the sequential wire number in element <wireNumber> of the wire identification, the wire sequential number element <wireSeqNumber> must not be used. Refer to Para 2.3.4.

**Use of the element <circuitIdent>**. The project or the organization must decide the use and the definition of the circuit code in the wire information section. For projects or organizations that hold the circuit code in child element <circuitIdent> of the wire identification, the circuit code element <circuitIdent> must not be used in the wire information section. Refer to Para 2.3.5.

**Use of the element <sectionIdent>**. The project or the organization must decide the use and the definition of the wire section identification in the wire information section. For projects or organizations that hold the wire section identification in element <sectionIdent> of the wire identification, the wire section identification element <sectionIdent> must not be used in the wire information section. Refer to Para 2.3.6.

**Use of the element <coaxialCableFlag>**. The project or the organization must decide the use and the definition of the coaxial information. Refer to Para 2.3.9.

**Use of the element <triaxialCableFlag>**. The project or the organization must decide the use and the definition of the tri-axial information. Refer to Para 2.3.10.

**Use of the element <emcCode>**. The project or the organization must decide the use and the definition of EMC classification and coding. Refer to Para 2.3.11.

**Use of the element <length>**. The project or the organization must decide the use and the definition of the wire length, the type of length information and the unit of measure. Refer to Para 2.3.12.

**Use of the element <wireColor>**. The project or the organization must decide the use and the definition of color information. Refer to Para 2.3.13.

**Use of the element <signalInfo>**. The project or the organization must decide the use and the definition of signal information for a wire. Refer to Para 2.3.14.

**Use of the element <responsiblePartnerCompany>**. The project or the organization must decide the use and the definition of responsible partner company information for a wire. As the attribute enterpriseCode is optional, a project or an organization must decide on its use. If used, then its use must be consistent and mandatory for the whole project. Using the child element <enterpriseName> can increase considerably the amount of data to be stored and exchanged. Therefore it is recommended to use only the attribute enterpriseCode in context with the element <wire> to indicate the responsible partner company instead of or in addition using the child element <enterpriseName>. Refer to Para 2.3.15.

**Use of the element <routing>**. The project or the organization must decide the use of wire routing information. If used, every clipping point must be populated in one element <clippingPoint>. Refer to Para 2.3.16.

**Use of the element <clippingPoint>**. The project or the organization must decide the use and the definition of the clipping point identification. The clipping point identification contains one clipping point. Refer to Para 2.3.16.1.

**Use of the element <feedThru>**. The project or the organization must decide the use and the definition of the feed-through element <feedThru> and the hole identifier attribute holeIdent. If used, the equipment, through which the wire passes, must be defined in the subordinate reference designator element <referenceDesignator>. Refer to Para 2.3.16.2.

**Use of the element <wireRoute>**. The project or the organization must decide the use and the definition of wire route lane codes. Refer to Para 2.3.17.

**Use of the element <restriction>**. The project or the organization must decide the use and the definition of the wire restrictions element <restriction>. Refer to Para 2.3.18.

**Use of the element <nextHigherAssy>**. The project or the organization must decide and define the use of the next higher assembly element <nextHigherAssy>. If used, it is recommended to populate the element <nextHigherAssy> consistently. Refer to Para 2.3.19.

**Use of the element <functionalDescrRef>**. The project or the organization must decide the use and the definition of functional description references. If used, references must be given consistently. Refer to Para 2.3.20.

**Use of the element <illustrationRef>**. The project or the organization must decide the use and the definition of illustration references. If used, references must be given consistently. Refer to Para 2.3.21.

# 4 Examples

## 4.1 Wire connection code examples

### 4.1.1 Connector with six contacts

The following Fig 1 and Table 10 show the content of the wire connection code and its child elements for a connector with six contacts.

ICN-C0419-S1000D00124-A-004-01

*Fig 1 Coding of wire connection code child elements - Connector*

*Table 10 Coding of wire connection code child elements - Connector*

| Contact identification | Screen order | Special connection | Electrical potential Termination module grouping value | Block grouping value | Shunt grouping value | Contact order value | Potential connections order |
|---|---|---|---|---|---|---|---|
| A | | | | | | 1 | |
| B | | | | | | 2 | |
| C | | | | | | 3 | |
| D | | | | | | 4 | |
| E | | | | | | 5 | |
| F | | | | | | 6 | |

### 4.1.2 Connector with five contacts and shielded wires

The following Fig 2 and Table 11 show the content of the wire connection code and its child elements for a connector with five contacts when shielded wires are connected to.

ICN-C0419-S1000D00187-A-002-01

*Fig 2 Coding of wire connection code child elements - Connector with shielded wires*

*Table 11 Coding of wire connection code child elements - Connector with shielded wires*

| Contact identification | Screen order | Special connection | Electrical potential Termination module grouping value | Block grouping value | Shunt grouping value | Contact order value | Potential connections order |
|---|---|---|---|---|---|---|---|
| | 1 | 1 | | | | 0 | |
| A | 2 | | | | | 1 | |
| B | 3 | | | | | 2 | |
| C | 5 | | | | | 3 | |
| D | 6 | | | | | 4 | |
| E | 4 | | | | | 5 | |

### 4.1.3 Switch with two poles and two positions

In the following example a switch with two poles (1-2-3, 4-5-6) and two positions (OFF-ON) is shown. Refer to Fig 3. In this example, all contacts, which are not base contacts, have allocated a higher value than the base contacts by adding an offset of 100 to order the base contacts before the non-base contacts. Refer to Table 12.

ICN-C0419-S1000D00125-A-003-01

*Fig 3 Coding of wire connection code child elements - Switch*

*Table 12 Coding of wire connection code child elements - Switch*

| Contact identification | Screen order | Special connection | Electrical potential Termination module grouping value | Block grouping value | Shunt grouping value | Contact order value | Potential connections order |
|---|---|---|---|---|---|---|---|
| 1 | | | | 1 | 1 | 101 | |
| 2 | | | | 1 | 1 | 2 | |
| 3 | | | | 1 | 2 | 103 | |
| 4 | | | | 2 | 1 | 104 | |
| 5 | | | | 2 | 1 | 5 | |
| 6 | | | | 2 | 2 | 106 | |

### 4.1.4 Relay with two poles

A relay with two poles (1-2-3, 4-5-6) is shown in the following example. Refer to Fig 4. Here, again all contacts of a pole, which are not base contacts, have allocated a higher value than the base contacts by adding an offset of 100. The coil of the relay has the lowest block grouping value 1 and will be displayed in a graphical presentation before the poles of the relay. Refer to Table 13.

ICN-C0419-S1000D00126-A-003-01

*Fig 4 Coding of wire connection code child elements - Relay*

*Table 13 Coding of wire connection code child elements - Relay*

| Contact identification | Screen order | Special connection | Electrical potential Termination module grouping value | Block grouping value | Shunt grouping value | Contact order value | Potential connections order |
|---|---|---|---|---|---|---|---|
| A | | | | 1 | 1 | 7 | |
| B | | | | 1 | 1 | 8 | |
| 1 | | | | 2 | 1 | 101 | |
| 2 | | | | 2 | 1 | 2 | |
| 3 | | | | 2 | 2 | 103 | |
| 4 | | | | 3 | 1 | 104 | |
| 5 | | | | 3 | 1 | 5 | |
| 6 | | | | 3 | 2 | 106 | |

### 4.1.5 Block of a termination module assembly

The following example shows one block of a termination module assembly. The block contains three shunts/busses. Refer to Fig 5. The contacts are ordered alphabetically by the contact order value. The different values for the shunt grouping information can be used to group and order the wires, connected to the same busses, for graphical presentation purposes. Refer to Table 14.

ICN-C0419-S1000D00127-A-003-01

*Fig 5 Coding of wire connection code child elements - Terminal junction module*

*Table 14 Coding of wire connection code child elements - Terminal junction module*

| Contact identification | Screen order | Special connection | Electrical potential | | | | Potential connections order |
|---|---|---|---|---|---|---|---|
| | | | Termination module grouping value | Block grouping value | Shunt grouping value | Contact order value | |
| A | | | 1 | 1 | 1 | 1 | |
| B | | | 1 | 1 | 1 | 2 | |
| C | | | 1 | 1 | 1 | 3 | |
| D | | | 1 | 1 | 1 | 4 | |
| E | | | 1 | 1 | 2 | 5 | |
| F | | | 1 | 1 | 2 | 6 | |
| G | | | 1 | 1 | 3 | 7 | |
| H | | | 1 | 1 | 3 | 8 | |
| J | | | 1 | 1 | 3 | 9 | |
| K | | | 1 | 1 | 3 | 10 | |

### 4.1.6 Earth bolt

Wires, connected to earth bolts, must have allocated the same value in the contact order element <`contactOrderValue`> and ascending values in the potential connections order element <`potentialConnectionsOrder`> as shown in Fig 6 and Table 15.

ICN-C0419-S1000D00188-A-002-01

*Fig 6 Coding of wire connection code child elements - Earth bolt*

*Table 15 Coding of wire connection code child elements - Earth bolt*

| Contact identification | Screen order | Special connection | Electrical potential | | | | Potential connections order |
|---|---|---|---|---|---|---|---|
| | | | Termination module grouping value | Block grouping value | Shunt grouping value | Contact order value | |
| | | | | | | 1 | 1 |
| | | | | | | 1 | 2 |
| | | | | | | 1 | 3 |

## 4.2 Wire end information of a screened and twisted wire

This example shows the wire end information of a screened and twisted wire that is connected to contact A of the connector 1071VP.

```
<fromEquip>

## 4.5 Wire end information of wires in a relay box

The following example shows the wire end information of some wires in a relay box, connecting relay 61UR, terminal junction module 3209VVB and receptacle on the relay box 3209VE as shown in Fig 8.

ICN-C0419-S1000D0185-002-01

## 4.6 Grouping of wires

The following example shows the grouping of four wires that are connected to the terminal stud with the contact identifier T5. The wires W-001 and W-002 are connected to one ring terminal, the wires W-003 and W-004 are connected to another ring terminal. Refer to Fig 9. Group code "A" is assigned to W-001 and W-002 and group code "B" to W-003 and W-004.

ICN-C0419-S1000D0206-001-01

# 1 General

The element <harness> and its child elements are used to capture and represent the harnesses, which are installed in the Product, and the related information.

# 2 Element <harness> and child elements

**Description:** The element <harness> is contained within the list of harnesses element <harnessGroup>. It contains harness information of the Product's wiring. The electrical wires of a system are often divided into separate harnesses.

**Markup element:** <harness> (C)

**Attributes:**

- applicRefId (O), defines the applicability of a harness by referencing the element <applic> in the referenced applicability group as described in Chap 3.9.5.3
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O) indicate change in accordance with Chap 3.9.5.2.1.1
- changeInfo (O), the change information of a harness in connection with the related modification. This attribute must have one of the following values:
  - "add" for harnesses which are added to the systems circuits by a modification
  - "delete" for harnesses which are removed from the systems circuits by a modification
  - "modify" for harnesses which are modified in the systems circuits by a modification

**Child elements:**

- <harnessIdent> (M), the harness identification
- <harnessInfo> (O), the harness information
- <routing> (O), the harness routing information
- <responsiblePartnerCompany> (O), the company or the organization which is responsible for the harness data
- <functionalDescrRef> (O), the functional description reference
- <illustrationRef> (O), the reference to harness illustrations

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use of the attribute changeInfo="delete" for removed harnesses
- Use and definition of applicability information for harnesses
- Use and definition of change attributes for harnesses

**Markup example:**

```
<wiringData>
<harnessGroup>
<harness applicRefId="app-0001">
<harnessIdent>...</harnessIdent>
<harnessInfo>...</harnessInfo>
<routing>...</routing>
<responsiblePartnerCompany>...</responsiblePartnerCompany>
<functionalDescrRef>...</functionalDescrRef>
<illustrationRef>...</illustrationRef>
</harness>
...
```

```
</harnessGroup>
</wiringData>
```

## 2.1 Harness identification

**Description:** The harness identification is the unique identifier of a harness in the system. It is the link between the harness and the included wires.

**Markup element:** <harnessIdent> (M)

**Attributes:**

- contextIdent (O), the context identification which is used in combination with the attribute manufacturerCodeValue to ensure the uniqueness of vendor harness data. Context identification contains an identifier, eg the part number of the next higher assembly that has been given to the assembly by the vendor.
- manufacturerCodeValue (O), the identification of the vendor, eg the CAGE code, which is used in combination with the attribute contextIdent to ensure uniqueness of vendor harness data.
- itemOriginator (O), indicates the origin of the harness, ie if a harness is an aircraft manufacturer harness or a vendor harness. Values and their meanings are defined by using the BREX mechanism. Refer to Chap 3.9.6.1 and Chap 4.10

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use and definition of the attributes contextIdent, manufacturerCodeValue and itemOriginator
- Definition of rules for the population of attribute manufacturerCodeValue in conjunction with the population of element <manufacturerCode>

**Markup example:**

The first example shows a harness with the identification 1310VB.

```
<harnessIdent>1310VB</harnessIdent>
```

The second example shows the markup of harness W5250 that is installed in the panel with the part number P1650-411, supplied by the vendor with the identification 01234.

```
<harnessIdent contextIdent="P1650-411"
manufacturerCodeValue="01234" itemOriginator="orig02">W5250
</harnessIdent>
```

## 2.2 Harness information

**Description:** The element <harnessInfo> contains harness information for the detailed identification of a harness, eg the part number and alternative identifications that can be used to identify this harness.

**Markup element:** <harnessInfo> (O)

**Attributes:**

- None

**Child elements:**

- <partNumber> (O), the harness part number
- <altIdentGroup> (O), the list of alternative harness identifications
- <harnessVariantIdent> (O), the harness variant identification
- <harnessVariantIssue> (O), the harness variant issue
- <harnessName> (O), the harness name
- <emcCode> (O), the harness separation code
- <temperature> (O), the harness temperature rating
- <harnessEnvironment> (O), the harness environmental information
- <sleeveGroup> (O), the list of harness sleeves

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use of the harness information element <harnessInfo> and its child elements

**Markup example:**

```
<harnessInfo>
<partNumber>J92101310-407</partNumber>
<harnessVariantIdent>407</harnessVariantIdent>
<harnessVariantIssue>B</harnessVariantIssue>
<harnessName>E ROUTE RH</harnessName>
<emcCode>E</emcCode>
</harnessInfo>
```

### 2.2.1 Part number

**Description:** The element <partNumber> contains the project or the organization specific part number of the harness. This element must be populated in accordance with Chap 3.9.5.1.

**Markup element:** <partNumber> (O)

**Attributes:**

- id (O), the identifier of the markup element. Refer to Chap 3.9.5.2.1.2.
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O) indicate change in accordance with Chap 3.9.5.2.1.1
- securityClassification (O), commercialClassification (O) and caveat (O), used for security and restrictive markings in accordance with Chap 3.6

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use and definition of the harness part number

**Markup example:**

```
<partNumber>J92223100-410</partNumber>
```

### 2.2.2 Alternative identifications

**Description:** The list of alternative harness identifications element <altIdentGroup> is used as a container for the subordinate alternative identification elements.

**Markup element:** <altIdentGroup> (O)

**Attributes:**

– None

**Child elements:**

– <altIdent> (C), the alternative identification

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the list of alternative harness identifications element <altIdentGroup>

**Markup example:**

```
<altIdentGroup>
<altIdent>...</altIdent>
<altIdent>...</altIdent>
</altIdentGroup>
```

2.2.2.1 Alternative identification

**Description:** The alternative identification element <altIdent> is used for additional identification of a harness. An alternative identification can contain a manufacturer part number and the related manufacturer code.

**Markup element:** <altIdent> (C)

**Attributes:**

– None

**Child elements:**

– <partNumber> (O), the harness alternative part number. Refer to Para 2.2.1
– <manufacturerCode> (O), the CAGE code of the harness manufacturer

**Business rules decisions:**

– None identified

**Markup example:**

The following markup example shows alternative identification information of a harness.

```
<altIdentGroup>
<altIdent>
<partNumber>LO3100FEB</partNumber>
<manufacturerCode>12345</manufacturerCode>
</altIdent>
</altIdentGroup>
```

*2.2.2.1.1 Harness manufacturer code*

**Description:** The harness manufacturer code element <manufacturerCode> is used in conjunction with the alternative harness part number. It contains the CAGE code of the harness manufacturer.

**Markup element:** <manufacturerCode> (O)

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to Chap 3.9.5.2.1.2.
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O) indicate change in accordance with Chap 3.9.5.2.1.1
- `securityClassification` (O), `commercialClassification` (O) and `caveat` (O), used for security and restrictive markings in accordance with Chap 3.6

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Consistent use and population of the element <`manufacturerCode`> in conjunction with <`partNumber`> across wiring data

**Markup example:**

```
<manufacturerCode>F0001</manufacturerCode>
```

### 2.2.3 Harness variant

**Description:** The harness variant identification element <`harnessVariantIdent`> contains the variant of a harness. Improvements during series production or engineering requirements are reasons why different harnesses are used in one type of system. This element identifies the different harnesses. A harness variant can be part of the project or the organization specific part number.

**Markup element:** <`harnessVariantIdent`> (O)

**Attributes:**

- None

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use and definition of the harness variant identification

**Markup example:**

The following markup example shows the variant 410 of harness J92223100-410.

```
<harnessVariantIdent>410</harnessVariantIdent>
```

### 2.2.4 Harness issue

**Description:** The harness variant issue element <`harnessVariantIssue`> contains the issue of a harness variant.

**Markup element:** <`harnessVariantIssue`> (O)

**Attributes:**

- None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the harness variant issue information

**Markup example:**

```
<harnessVariantIssue>A</harnessVariantIssue>
```

### 2.2.5 Harness name

**Description:** The harness name element <harnessName> gives the name of a harness.

**Markup element:** <harnessName> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the harness name

**Markup example:**

```
<harnessName>FCS LANE 1 FORWARD EQUIPMENT BAY</harnessName>
```

### 2.2.6 Harness separation code

**Description:** The harness separation code element <emcCode> contains the electromagnetic compatibility (EMC) classification of a harness.

**Markup element:** <emcCode> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of harness separation code information

**Markup example:**

```
<emcCode>E</emcCode>
```

### 2.2.7 Harness temperature rating

**Description:** The element <temperature> describes the minimum and maximum temperature rating, for which the harness is approved.

**Markup element:** <temperature> (O)

**Attributes:**

– None

**Child elements:**

– <minTemperature> (O), the minimum temperature rating
– <maxTemperature> (O), the maximum temperature rating

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of harness temperature rating

**Markup example:**

The following markup example shows the maximum temperature rating for a harness, in this case 500 degrees Fahrenheit.

```
<temperature>
<maxTemperature unitOfMeasure="degF">500</maxTemperature>
</temperature>
```

2.2.7.1 Harness temperature rating child elements

**Description:** The elements <minTemperature> and <maxTemperature> give the lower and upper temperature rating boundaries for a harness.

**Markup elements:** <minTemperature> (O) and <maxTemperature> (O)

**Attributes:**

– unitOfMeasure (O), the unit of measure for the temperature

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of harness minimum and/or maximum temperature rating including the unit of measure

**Markup example:**

```
<temperature>
<minTemperature unitOfMeasure="degC">-10</minTemperature>
<maxTemperature unitOfMeasure="degC">60</maxTemperature>
</temperature>
```

**2.2.8 Harness environment**

**Description:** The element <harnessEnvironment> gives information concerning the environment in which a harness is located.

**Markup element:** <harnessEnvironment> (O)

**Attributes:**

– `highVibrationFlag` (O), indicates if a harness is located in a high vibration environment. The following values are available:
  - "`0`" (D), the harness is not located in a high vibration environment
  - "`1`", the harness is located in a high vibration environment

– `hydraulicFlag` (O), indicates if a harness is located in a hydraulic environment
  - "`0`" (D), the harness is not located in a hydraulic environment
  - "`1`", the harness is located in a hydraulic environment

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of harness environment information element <`harnessEnvironment`> and its attributes

**Markup example:**

```
<harnessEnvironment highVibrationFlag="1" hydraulicFlag="0"/>
```

### 2.2.9 List of harness sleeves

**Description:** The element <`sleeveGroup`> contains a list of sleeves that are used on the harness.

**Markup element:** <`sleeveGroup`> (O)

**Attributes:**

– None

**Child elements:**

– <`sleeve`> (C), the harness sleeve information

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the list of sleeves element <`sleeveGroup`>

**Markup example:**

```
<sleeveGroup>
<sleeve>...</sleeve>
<sleeve>...</sleeve>
</sleeveGroup>
```

#### 2.2.9.1 Harness sleeve information

**Description:** The element <`sleeve`> gives information about a harness sleeve.

**Markup element:** <`sleeve`> (C)

**Attributes:**

– `sleeveMaterial` (O), indicates the material of which the sleeve is made

**Child elements:**

– <partNumber> (O), the part number of the harness sleeve. Refer to Para 2.2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the attribute sleeveMaterial and the child element <partNumber>

**Markup example:**

```
<sleeveGroup>
<sleeve sleeveMaterial="Teflon">
<partNumber>SLV-5678</partNumber>
</sleeve>
</sleeveGroup>
```

## 2.3 Routing

**Description:** The element <routing> contains routing information of a harness via clipping points. It can also contain routing information through special components, eg panels or bungs.

**Markup element:** <routing> (O)

**Attributes:**

– None

**Child elements:**

– <clippingPoint> (O), the clipping point information for a harness. Refer to Chap 3.9.5.2.9.2
– <feedThru> (O), the information about the equipment through which a harness passes. Refer to Chap 3.9.5.2.9.2

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the routing information element <routing> and its subordinate information for harnesses

**Markup example:**

```
<routing>
<clippingPoint>271-11</clippingPoint>
<clippingPoint>273-2</clippingPoint>
</routing>
```

## 2.4 Responsible partner company

**Description:** The responsible partner company element <responsiblePartnerCompany> indicates the company or the organization, which is responsible for the harness data. This element must be populated in accordance with Chap 3.9.5.1.

**Markup element:** <responsiblePartnerCompany> (O)

**Attributes:**

– id (O), the identifier of the markup element. Refer to Chap 3.9.5.2.1.2.

– `enterpriseCode` (O), the CAGE code of the responsible company or organization

**Child elements:**

– <`enterpriseName`> (O), the name of the responsible company or organization

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of responsible partner company information for harnesses

**Markup example:**

The following markup example shows the responsible partner company information of a harness. The responsible partner company is indicated by its CAGE code.

```
<responsiblePartnerCompany enterpriseCode="K0378"/>
```

### 2.4.1 Responsible partner company name

**Description:** The responsible partner company name element <`enterpriseName`> gives the name of the company or the organization, which is responsible for the data. This element must be populated in accordance with Chap 3.9.5.1.

**Markup element:** <`enterpriseName`> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the responsible partner company name element <`enterpriseName`>

**Markup example:**

```
<enterpriseName>Amphenol Ltd</enterpriseName>
```

## 2.5 Functional description reference

**Description:** The functional description reference element <`functionalDescrRef`> contains references to other parts of the electrical system publications for further information about a harness, eg a description of how it is made and its function. References must be populated in accordance with Chap 3.9.5.2.1.2.

**Markup element:** <`functionalDescrRef`> (O)

**Attributes:**

– None

**Child elements:**

– <`refs`> (C), the functional description reference information. Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of functional description references for harnesses

## 2.6 Illustration reference

**Description:** The illustration reference element <illustrationRef> contains references to other parts of the electrical system publications, which show harness illustrations. These illustrations can show the routing of the harness. References must be populated in accordance with Chap 3.9.5.2.1.2.

**Markup element:** <illustrationRef> (O)

**Attributes:**

– None

**Child elements:**

– <refs> (C), the illustration reference information. Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of illustration references for harnesses

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use of the attribute changeInfo="delete" for removed harnesses**. The project or the organization must decide the use of the attribute changeInfo="delete" for removed harnesses. Refer to Para 2.

**Use and definition of applicability information**. The project or the organization must decide the use and the definition of applicability information for harnesses. It is strongly recommended to define the harness applicability precisely and populate it in accordance with the project or the organization specific rules. It is recommended to use at least the version and version number information given in the products cross-reference table. Harnesses with modifications must in addition use the information given in the conditions cross-reference table. Refer to Para 2.

**Use and definition of change attributes**. The project or the organization must decide the use and the definition of change attributes for harness data. Refer to Para 2.

**Use of the element <harnessIdent>**. The project or the organization must decide the content of the element <harnessIdent> and the use and values of its attributes. Refer to Para 2.1.

**Use of the element <harnessInfo>**. The project or the organization must decide the use of harness information. If used, it is recommended that at least the contained element <partNumber> is populated for detailed identification of the harness. Refer to Para 2.2.

**Use of the element <partNumber>**. The project or the organization must decide the use and the definition of harness part numbers. Refer to Para 2.2.1.

**Use of the element <altIdentGroup>**. The project or the organization must decide the use of alternative identifications. If used, it is recommended to populate the elements <partNumber> in conjunction with <manufacturerCode> as child elements of <altIdent>. Refer to Para 2.2.2.

**Use of the element <harnessVariantIdent>**. The project or the organization must decide the use and the definition of harness variant identifications. Refer to Para 2.2.3.

**Use of the element <harnessVariantIssue>**. The project or the organization must decide the use and the definition of harness variant issue information. Refer to Para 2.2.4.

**Use of the element <harnessName>**. The project or the organization must decide the use and the definition of harness name information. Refer to Para 2.2.5.

**Use of the element <emcCode>**. The project or the organization must decide the use and the definition of harness separation code information. Refer to Para 2.2.6.

**Use of the element <temperature>**. The project or the organization must decide the use of harness temperature rating information. Refer to Para 2.2.7.

**Use of the element <harnessEnvironment>**. The project or the organization must decide the use of harness environmental information and the use of the attributes highVibrationFlag and hydraulicFlag. Refer to Para 2.2.8.

**Use of the element <sleeveGroup>**. The project or the organization must decide the use and the definition of the list of harness sleeves and the subordinate sleeve information. This includes the use and the definition of the attribute sleeveMaterial and the element <partNumber>. If used, the part number gives a link to the standard parts information of the wiring data. Refer to Para 2.2.9.

**Use of the element <routing>**. The project or the organization must decide the use of harness routing. If used, every clipping point must be populated in one element <clippingPoint>. Refer to Para 2.3.

**Use of the element <clippingPoint>**. The project or the organization must decide the use and definition of the clipping point identification. The clipping point identification contains one clipping point. Refer to Para 2.3.

**Use of the element <feedThru>**. Feed-through is mainly intended to be used for wires that pass through special components, eg current transformers and bungs. But also parts of a harness or a complete harness can pass through special components, eg bungs. This is indicated by using the element <feedThru>. Then the project or the organization must decide the use and the definition of feed-through information for harnesses. Refer to Para 2.3.

**Use of the element <responsiblePartnerCompany>**. The project or the organization must decide the use and the definition of responsible partner company information for a harness. As the attribute enterpriseCode is optional, a project or an organization must decide on its use. If used, then its use must be consistent and mandatory for the whole project. Using the child element <enterpriseName> can increase considerably the amount of data to be stored and exchanged. Therefore it is recommended to use only the attribute enterpriseCode in context with the element <harness> to indicate the responsible partner company instead of or in addition using the child element <enterpriseName>. Refer to Para 2.4.

**Use of the element <functionalDescrRef>**. The project or the organization must decide the use and the definition of functional description references. If used, references must be given consistently. Refer to Para 2.5.

**Use of the element <illustrationRef>**. The project or the organization must decide the use and the definition of illustration references. If used, references must be given consistently. Refer to Para 2.6.

# 1 General

The element <`electricalEquip`> and the child elements are used to capture and represent the electrical equipment, that is installed in the Product, and related information.

# 2 Element <`electricalEquip`> and child elements

**Description:** The element <`electricalEquip`> is contained within the list of electrical equipment element <`electricalEquipGroup`>. It contains electrical equipment information of the Product's wiring.

**Markup element:** <`electricalEquip`> (C)

**Attributes:**

- `applicRefId` (O), defines the applicability of equipment by referencing the element <`applic`> in the referenced applicability group as described in Chap 3.9.5.3
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O) indicate change in accordance with Chap 3.9.5.2.1.1
- `changeInfo` (O), the change information of equipment connection with the related modification. This attribute must have one of the following values:
  - "`add`" for electrical equipment that is added to the systems circuits by a modification
  - "`delete`" for electrical equipment that is removed from the systems circuits by a modification
  - "`modify`" for electrical equipment that is modified in the systems circuits by a modification
- `equipState` (O), describes the electrical state of equipment. The different values of this attribute are used to distinguish equipment with allocated reference designator, equipment

that have no reference designator allocated, and placeholders for empty positions on panels, etc. This attribute can have only one of the following values:

- "active" for electrical equipment, which is installed in one of the systems circuits and have allocated a reference designator
- "notactiv" for electrical equipment, which is not active in one of the systems circuits. A not active equipment is used as a placeholder, where eg no component is installed in a position of a circuit breaker panel
- "logequip" for electrical equipment, which is installed in one of the systems circuits and have no reference designator allocated

**Child elements:**

- <referenceDesignator> (M), the reference designator
- <partNumber> (O), the part number
- <altIdentGroup> (O), the list of alternative identifications
- <assyInstruction> (O), the assembly instruction information
- <maxMountingPositions> (O), the maximum number of mounting positions
- <systemBreakdownCode> (O), the system breakdown code
- <transverseLink> (O), the transverse link information
- <connectionListClass> (O), the connection list class
- <electricalLogic> (O), the electrical logic information
- <responsiblePartnerCompany> (O), the company or the organization which is responsible for the electrical equipment data
- <equipName> (O), the electrical equipment name
- <reqQuantity> (O), the required quantity information
- <installationInfo> (O), the installation information
- <equipDescrRef> (O), the equipment description reference
- <functionalDescrRef> (O), the functional description reference
- <illustrationRef> (O), the reference to equipment illustrations

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use of the attribute changeInfo="delete" for removed equipment
- Use and definition of applicability information for electrical equipment
- Use and definition of change attributes for electrical equipment

**Markup example:**

```
<wiringData>
<electricalEquipGroup>
<electricalEquip equipState="active" applicRefId="app-0001">
<referenceDesignator>...</referenceDesignator>
<partNumber>...</partNumber>
<connectionListClass>...</connectionListClass>
<electricalLogic>...</electricalLogic>
<responsiblePartnerCompany>...</responsiblePartnerCompany>
<equipName>...</equipName>
<installationInfo>...</installationInfo>
</electricalEquip>
...
</electricalEquipGroup>
</wiringData>
```

## 2.1 Reference designator

**Description:** The reference designator is the unique identifier of electrical equipment in the system.

**Markup element:** <`referenceDesignator`> (M)

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to Chap 3.9.5.2.1.2.
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O) indicate change in accordance with Chap 3.9.5.2.1.1
- `installationIdent` (O), used to achieve uniqueness for multiple occurrence equipment. Multiple occurrence equipment is equipment that is more than once installed in the Product, eg an aircraft, and have allocated the same reference designator for all installation instances.
- `contextIdent` (O), the context identification which is used in combination with the attribute `manufacturerCodeValue` to ensure the uniqueness of vendor equipment data. Context identification contains an identifier, eg the part number of the next higher assembly that has been given to the assembly by the vendor.
- `manufacturerCodeValue` (O), the identification of the vendor, eg the CAGE code, which is used in combination with the attribute `contextIdent` to ensure uniqueness of vendor equipment data.
- `itemOriginator` (O), indicates the origin of the equipment, ie if the equipment is aircraft manufacturer equipment or vendor equipment. Values and their meanings are defined by using the BREX mechanism. Refer to Chap 3.9.6.1 and Chap 4.10
- `securityClassification` (O), `commercialClassification` (O) and `caveat` (O), used for security and restrictive markings in accordance with Chap 3.6

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use of the reference designator element <`referenceDesignator`> and the related attributes to achieve uniqueness of vendor equipment

**Markup example:**

The following example shows the markup of a connector with the reference designator 1071VP:

```
<referenceDesignator>1071VP</referenceDesignator>
```

The following second example shows the markup of equipment EQ12 that is installed in the panel with the part number N1254443-A, supplied by the vendor with the identification F2345:

```
<referenceDesignator manufacturerCodeValue="F2345"
contextIdent="N1254443-A"
itemOriginator="orig02">EQ12</referenceDesignator>
```

## 2.2 Part number

**Description:** The part number element <`partNumber`> contains the project or the organization specific part number of the equipment. This element must be populated in accordance with Chap 3.9.5.1.

**Markup element:** <`partNumber`> (O)

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to Chap 3.9.5.2.1.2.
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O) indicate change in accordance with Chap 3.9.5.2.1.1
- `securityClassification` (O), `commercialClassification` (O) and `caveat` (O), used for security and restrictive markings in accordance with Chap 3.6

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use and definition of the equipment part number

**Markup example:**

```
<partNumber>JN1022-GA45AX</partNumber>
```

## 2.3 Alternative identifications

**Description:** The list of alternative identifications element <`altIdentGroup`> is used as a container for the subordinate alternative identification elements.

**Markup element:** <`altIdentGroup`> (O)

**Attributes:**

- None

**Child elements:**

- <`altIdent`> (C), the alternative identification

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use of the list of alternative equipment identifications element <`altIdentGroup`>

**Markup example:**

```
<altIdentGroup>
<altIdent>...</altIdent>
<altIdent>...</altIdent>
</altIdentGroup>
```

### 2.3.1 Alternative identification

**Description:** The alternative identification element <`altIdent`> is used for additional identification of equipment. An alternative identification can contain a manufacturer part number and the related manufacturer code.

**Markup element:** <`altIdent`> (C)

**Attributes:**

- None

**Child elements:**

- <partNumber> (O), the equipment alternative part number. Refer to Para 2.2
- <manufacturerCode> (O), the CAGE code of the equipment manufacturer

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- None identified

**Markup example:**

The following markup example shows an alternative identification for part number JN1032A3:

```
<altIdentGroup>
<altIdent>
<partNumber>711-5016-3(462)</partNumber>
<manufacturerCode>K5678</manufacturerCode>
</altIdent>
</altIdentGroup>
```

2.3.1.1 Equipment manufacturer code

**Description:** The equipment manufacturer code element <manufacturerCode> is used in conjunction with the alternative equipment part number. It contains the CAGE code of the equipment manufacturer.

**Markup element:** <manufacturerCode> (O)

**Attributes:**

- id (O), the identifier of the markup element. Refer to Chap 3.9.5.2.1.2.
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O) indicate change in accordance with Chap 3.9.5.2.1.1
- securityClassification (O), commercialClassification (O) and caveat (O), used for security and restrictive markings in accordance with Chap 3.6

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Consistent use and population of the element <manufacturerCode> in conjunction with <partNumber> across wiring data

## 2.4 Assembly instructions

**Description:** The element <assyInstruction> is used as a container for the subordinate electrical equipment assembly information.

**Markup element:** <assyInstruction> (O)

**Attributes:**

- None

**Child elements:**

- <assy> (O), the assembly information for the equipment

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the assembly instructions element <assyInstruction>

**Markup example:**

```
<assyInstruction>
<assy>...</assy>
<assy>...</assy>
</assyInstruction>
```

### 2.4.1 Assembly information

**Description:** The equipment assembly information element <assy> contains subordinate assembly information for the equipment in coded form and references to detailed assembly instructions.

**Markup element:** <assy> (O)

**Attributes:**

– None

**Child elements:**

– <instructionIdent> (O), the equipment assembly information in coded form
– <refs> (O), used for references to detailed instructions for assembling the equipment

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the equipment assembly information element <assy>

**Markup example:**

```
<assy>
<instructionIdent>...</instructionIdent>
<refs>...</refs>
</assy>
```

#### 2.4.1.1 Assembly information identification

**Description:** The element <instructionIdent> gives equipment assembly information in coded form.

**Markup element:** <instructionIdent> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the equipment assembly information encoding element <instructionIdent>

**Markup example:**

```
<instructionIdent>ASSY806</instructionIdent>
```

2.4.1.2 References

**Description:** The element <refs> contains links to other parts of the systems publication, which give the detailed instructions assembling the equipment. References must be populated in accordance with Chap 3.9.5.2.1.2.

**Markup element:** <refs> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Chap 3.9.5.2.1.2

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the references element <refs>

## 2.5 Maximum number of mounting positions

**Description:** The maximum number of mounting positions element <maxMountingPositions> contains the number of mounting positions on a next higher assembly, eg a circuit breaker panel. This element is only used for equipment that has mounting positions for other electrical equipment, eg connectors or circuit breakers.

**Markup element:** <maxMountingPositions> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the maximum number of mounting positions information

**Markup example:**

The following markup example shows the next higher assembly panel AC1650, which has six mounting positions.

```
<electricalEquip equipState="active">
<referenceDesignator>AC1650</referenceDesignator>
<maxMountingPositions>6</maxMountingPositions>
</electricalEquip>
```

## 2.6 System breakdown code

**Description:** Equipment of complex systems is divided into subsystems using the system breakdown code element <systemBreakdownCode>. This element can be used to provide the system breakdown code of such equipment.

**Markup element:** <systemBreakdownCode> (O)

**Attributes:**

– id (O), the identifier of the markup element. Refer to Chap 3.9.5.2.1.2.

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the system breakdown code element <systemBreakdownCode>

**Markup example:**

```
<systemBreakdownCode>24-31-02-00</systemBreakdownCode>
```

## 2.7 Transverse link

**Description:** The transverse link element <transverseLink> provides information about internally or externally realized electrical connections of different contacts/bolts of equipment, eg terminal strips.

**Markup element:** <transverseLink> (O)

**Attributes:**

– None

**Child elements:**

– <electricalEquipConnection> (O), the equipment connection information

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of transverse link information

**Markup example:**

```
<transverseLink>
<electricalEquipConnection>...</electricalEquipConnection>
<electricalEquipConnection>...</electricalEquipConnection>
</transverseLink>
```

### 2.7.1 Electrical equipment connections

**Description:** The electrical equipment connection element <electricalEquipConnection> gives information about the electrical connections that belong to a transverse link.

**Markup element:** <electricalEquipConnection> (O)

**Attributes:**

– connectionType (O), the type of connection. As an example, consider a relay. The connections of the poles are direct, done by a piece of metal, but the contacts of the relay coil(s) must also be shown. In this case connectionType="direct" means it is a direct connection, connectionType="coil" means that a coil has to be shown

between the contacts. Connection types can also be identified by using coded values like "1" - direct connection, "2" - coil, etc.

**Child elements:**

– <contact> (C), the contact identification

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of electrical equipment connection information

2.7.1.1 Contact identification

**Description:** The element <contact> describes the contact identification by its attributes. This element must be populated in accordance with Chap 3.9.5.2.9.2.

**Markup element:** <contact> (C)

**Attributes:**

– Refer to Chap 3.9.5.2.9.2.

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the contact identification attributes

**Markup example:**

The following example shows the markup for coding the transverse links of the equipment. The contacts/bolts 1, 2, 3 and 4 are electrically connected, and the contacts/bolts 5 and 6 are electrically connected.

```
<transverseLink>
<electricalEquipConnection>
<contact contactIdent="1"/>
<contact contactIdent="2"/>
<contact contactIdent="3"/>
<contact contactIdent="4"/>
</electricalEquipConnection>
<electricalEquipConnection>
<contact contactIdent="5"/>
<contact contactIdent="6"/>
</electricalEquipConnection>
</transverseLink>
```

## 2.8 Connection list class

**Description:** The connection list class element <connectionListClass> describes special groups of equipment, eg switches, connectors etc, in coded form.

It is recommended to use the connection list class element <connectionListClass> as given in Table 2.

*Table 2 Connection list classes*

| Connection list class | Equipment group |
|---|---|
| 1 | Connectors, single |
| 2 | VR-/VP- Connectors, single |
| 3 | VR-/VP- Connectors |
| 4 | VE- Connectors, single |
| 5 | VE- Connectors |
| 6 | Earth bolts |

| 25 | Circuit breakers, fuses |

**Markup element:** <`connectionListClass`> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the connection list class element <connectionListClass>

**Markup example:**

The following markup example shows the connection list class information of a switch.

```
<connectionListClass>15</connectionListClass>
```

## 2.9 Electrical logic

**Description:** The electrical logic element <electricalLogic> provides an optional container for electrical states and internal connections between contacts for electrical or electronic equipment.

**Markup element:** <electricalLogic> (O)

**Attributes:**

– None

**Child elements:**

– <electricalEquipState> (C), the electrical equipment state

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the electrical logic element <electricalLogic>

**Markup example:**

```
<electricalLogic>
<electricalEquipState>...</electricalEquipState>
<electricalEquipState>...</electricalEquipState>
</electricalLogic>
```

### 2.9.1 Electrical equipment state

**Description:** The electrical equipment state element <electricalEquipState> provides state information for each connection to some particular electrical equipment.

**Markup element:** <electricalEquipState> (C)

**Attributes:**

– initialStateFlag (O), indicates whether the state information is the initial state of the equipment or not. The following values must be used:
  - "1" for electrical states that are initial states
  - "0" for electrical states that are not initial states. In this case, the attribute initialStateFlag can be dropped

**Child elements:**

– <electricalEquipConnection> (M), the equipment connection information
– <electricalStateDescr> (O), the description of an electrical state

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the initial state flag attribute initialStateFlag
– Use and definition of the electrical state description

2.9.1.1 Electrical equipment connections

**Description:** The electrical equipment connection element <electricalEquipConnection> must be used and gives information about the connections that belong to the same electrical state. Refer to Para 2.7.1.

2.9.1.2 Electrical state description

**Description:** The electrical state description element <electricalStateDescr> contains the narrative description of an electrical state, eg “ENERGIZED".

**Markup element:** <electricalStateDescr> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the electrical state description element <electricalStateDescr>

**Markup example:**

The following markup example describes a switch, which has two states: DEENERGIZED and ENERGIZED. In the initial state or the default state (initialStateFlag="1"), the switch connects contacts C and NC. In the other state (initialStateFlag="0") it connects contacts C and NO.

```
<electricalLogic>
<electricalEquipState initialStateFlag="1">
<electricalEquipConnection>
<contact contactIdent="C"/>
<contact contactIdent="NC"/>
</electricalEquipConnection>
<electricalStateDescr>DEENERGIZED</electricalStateDescr>
</electricalEquipState>
<electricalEquipState>
<electricalEquipConnection>
<contact contactIdent="C"/>
<contact contactIdent="NO"/>
</electricalEquipConnection>
<electricalStateDescr>ENERGIZED</electricalStateDescr>
</electricalEquipState>
</electricalLogic>
```

## 2.10 Responsible partner company

**Description:** The responsible partner company element <responsiblePartnerCompany> indicates the company or the organization, which is responsible for the equipment. This element must be populated in accordance with Chap 3.9.5.1.

**Markup element:** <responsiblePartnerCompany> (O)

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to Chap 3.9.5.2.1.2.
- `enterpriseCode` (O), the CAGE code of the responsible company or organization

**Child elements:**

- `<enterpriseName>` (O), the name of the responsible company or organization

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use and definition of responsible partner company information for electrical equipment

**Markup example:**

```
<responsiblePartnerCompany enterpriseCode="K0378"/>
```

### 2.10.1 Responsible partner company name

**Description:** The responsible partner company name element `<enterpriseName>` gives the name of the company or the organization, which is responsible for the data. This element must be populated in accordance with Chap 3.9.5.1.

**Markup element:** `<enterpriseName>` (O)

**Attributes:**

- None

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use of the responsible partner company name element `<enterpriseName>`

**Markup example:**

```
<enterpriseName>Amphenol Ltd</enterpriseName>
```

## 2.11 Electrical equipment name

**Description:** The electrical equipment name element `<equipName>` describes the equipment. A standard name like SWITCH can be used or a name that defines the equipment in conjunction with its use on the system, eg BATTERY MASTER SWITCH.

**Markup element:** `<equipName>` (O)

**Attributes:**

- None

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use and definition of the electrical equipment name element `<equipName>`

**Markup example:**

```
<equipName>BATTERY MASTER SWITCH</equipName>
```

## 2.12 Quantity

**Description:** The quantity element <reqQuantity> contains the number of multiple occurrence equipment installed in the Product, eg an aircraft.

**Markup element:** <reqQuantity> (O)

**Attributes:**

- unitOfMeasure (O), the unit of measure for the quantity
- id (O), the identifier of the markup element. Refer to Chap 3.9.5.2.1

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use and definition of the quantity element <reqQuantity> and its attributes for multiple occurrence electrical equipment

**Markup example:**

The following markup shows an example for using the element <reqQuantity> for multiple occurrence equipment that is installed three times in the aircraft.

```
<reqQuantity>3</reqQuantity>
```

## 2.13 Installation information

**Description:** The element <installationInfo> contains electrical equipment installation information. The element is repeatable to cover multiple occurrence equipment.

**Markup element:** <installationInfo> (O)

**Attributes:**

- installationIdent (O), contains a unique value for every instance of the reference designator. The instance identifier is necessary to achieve a 1:1 relationship between a plug and the mating connector

**Child elements:**

- <installationLocation> (O), the installation location
- <siblingPlugIdent> (O), the twin connector identification
- <accessDoorOrPanel> (O), the access door or panel
- <nextHigherAssy> (O), the next higher assembly
- <positionOnNextHigherAssy> (O), the position on the next higher assembly

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use and definition of the installation information element <installationInfo> and its attribute installationIdent

**Markup example:**

Refer to Para 4.1.

### 2.13.1 Installation location

**Description:** The repeatable element <installationLocation> contains the installation location information of the equipment instances.

**Markup element:** <installationLocation> (O)

**Attributes:**

- unitOfMeasure (O), the unit of measure for the installation location if applicable for the installation location type
- installationLocationType (O), the type of the installation location information, eg zone, section, station. Values and their meanings are defined by using the BREX mechanism. Refer to Chap 3.9.6.1 and Chap 4.10

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use and definition of the installation location information, its attributes and child elements

**Markup example:**

Refer to Para 4.2.

### 2.13.2 Twin connector identification

**Description:** The element <siblingPlugIdent> contains the reference designator of the mate connector in the subordinate element <referenceDesignator>. That means, the plug gets as twin connector identification the reference designator of the receptacle, and the receptacle gets as twin connector identification the reference designator of the plug.

**Markup element:** <siblingPlugIdent> (O)

**Attributes:**

- None

**Child elements:**

- <referenceDesignator> (C), the reference designator of the twin connector. Refer to Para 2.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use of the twin connector identification element <siblingPlugIdent>

**Markup example:**

The following markup example shows the identification twin connector 1071VR (of the connector 1071VP).

```
<siblingPlugIdent>
<referenceDesignator>1071VR</referenceDesignator>
</siblingPlugIdent>
```

### 2.13.3 Access door or panel

**Description:** The element <accessDoorOrPanel> contains information about doors or panels to be opened for getting access to the equipment.

**Markup element:** <accessDoorOrPanel> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the access door or panel information element <accessDoorOrPanel>

**Markup example:**

The following markup example shows that door L107 has to be opened for getting access to the equipment.

```
<accessDoorOrPanel>L107</accessDoorOrPanel>
```

### 2.13.4 Next higher assembly

**Description:** Equipment, which is part of a physical or logical assembly, eg a box, the next higher assembly element <nextHigherAssy> can be used to identify this assembly.

**Markup element:** <nextHigherAssy> (O)

**Attributes:**

– None

**Child elements:**

– <referenceDesignator> (C), the identification of the next higher assembly of the equipment. Refer to Para 2.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the next higher assembly element <nextHigherAssy> of the electrical equipment

**Markup example:**

The following markup example shows equipment, which is part of the box 1004VE.

```
<nextHigherAssy>
<referenceDesignator>1004VE</referenceDesignator>
</nextHigherAssy>
```

### 2.13.5 Position on next higher assembly

**Description:** Equipment, which is mounted on a physical assembly, eg a box or a panel, has allocated the identification of the position on the next higher assembly element <positionOnNextHigherAssy>. The position is indicated either by a direct position or by grid coordinates.

**Markup element:** <positionOnNextHigherAssy> (O)

**Attributes:**

- mountPosition (O), the direct position number on which the equipment is mounted to the next higher assembly
- mountRow (O), the row information on which the equipment is mounted to the next higher assembly. This attribute is normally used in combination with the attribute mountColumn
- mountColumn (O), the column information on which the equipment is mounted to the next higher assembly. This attribute is normally used in combination with the attribute mountRow

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use and definition of the position on next higher assembly element <positionOnNextHigherAssy> and its attributes

**Markup example:**

Refer to Para 4.3.

## 2.14 Equipment description reference

**Description:** The equipment description reference element <equipDescrRef> contains references to other parts of the electrical system publications, which give further information about this equipment, such as the description of how it is made.

**Markup element:** <equipDescrRef> (O)

**Attributes:**

- None

**Child elements:**

- <refs> (C), the equipment description reference information. Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use and definition of equipment description references for electrical equipment

## 2.15 Functional description reference

**Description:** The functional description reference element <functionalDescrRef> contains references to other parts of the electrical system publications for further information about the equipment, eg a description of its function. References must be populated in accordance with Chap 3.9.5.2.1.2.

**Markup element:** <functionalDescrRef> (O)

**Attributes:**

- None

**Child elements:**

– <refs> (C), the functional description reference information. Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of functional description references for electrical equipment

## 2.16 Illustration reference

**Description:** The Illustration reference element <illustrationRef> contains references to other parts of the electrical system publications, which show illustrations of the equipment. References must be populated in accordance with Chap 3.9.5.2.1.2.

**Markup element:** <illustrationRef> (O)

**Attributes:**

– None

**Child elements:**

– <refs> (C), the illustration reference information. Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of illustration references for electrical equipment

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use of the attribute changeInfo="delete" for removed harnesses**. The project or the organization must decide the use of the attribute changeInfo="delete" for removed harnesses. Refer to Para 2.

**Use and definition of applicability information**. The project or the organization must decide the use and the definition of applicability information for the equipment. It is strongly recommended to define the equipment applicability precisely and populate it in accordance with the project or the organization specific rules. It is recommended to use at least the version and version number information given in the products cross-reference table. Equipment with modifications must in addition use the information given in the conditions cross-reference table. Refer to Para 2.

**Use and definition of change attributes**. The project or the organization must decide the use and the definition of change attributes for electrical equipment data. Refer to Para 2.

**Use of the element <referenceDesignator>**. The reference designator is the link between the electrical equipment and the connected wires. Therefore it is necessary to define project or organization specific rules for the use and population of this element and its attributes. Refer to Para 2.1.

**Use of the element <partNumber>**. The project or the organization must decide the use and the definition of part numbers for electrical equipment. Refer to Para 2.2.

**Use of the element <altIdentGroup>**. The project or the organization must decide the use of alternative identifications. If used, it is recommended to populate the elements

<partNumber> in conjunction with <manufacturerCode> as child elements of <altIdent>. Refer to Para 2.3.

**Use of the element <assyInstruction> and its child elements**. The project or the organization must decide and define the use of equipment assembly information, in particular the assembly instruction information in coded form, which can be given by element <instructionIdent>. If used, this element must be populated consistently. Refer to Para 2.4.

**Use of the element <maxMountingPositions>**. The project or the organization must decide and define the use of the maximum number of mounting positions, which can be given by element <maxMountingPositions>. If used, this element must be populated consistently. Refer to Para 2.5.

**Use of the element <systemBreakdownCode>**. The project or the organization must decide and define the use of the system breakdown code element <systemBreakdownCode> for electrical equipment. If used, this element must be populated consistently. Refer to Para 2.6.

**Use of the element <transverseLink>**. The project or the organization must decide and define exactly the use of transverse link information. When using it for the description of electrical connections, this element and its child elements and attributes must be used consistently. Refer to Para 2.7.

**Use of the element <connectionListClass>**. The project or the organization must decide and define the use of connection list class information for grouping of electrical equipment. It is recommended to populate this element as proposed in Table 2. Refer to Para 2.8.

**Use of the element <electricalLogic>**. The project or the organization must decide the use of electrical logic information including subordinate electrical state and connection information to describe electric or electronic equipment in more detail. Refer to Para 2.9.

**Use of the element <responsiblePartnerCompany>**. The project or the organization must decide the use and the definition of responsible partner company information for electrical equipment. As the attribute enterpriseCode is optional, a project or an organization must decide on its use. If used, then its use must be consistent and mandatory for the whole project. Using the child element <enterpriseName> can increase considerably the amount of data to be stored and exchanged. Therefore it is recommended to use only the attribute enterpriseCode in context with the element <electricalEquip> to indicate the responsible partner company instead of or in addition using the child element <enterpriseName>. Refer to Para 2.10.

**Use of the element <equipName>**. The project or the organization must decide the use and the exact definition of equipment name information. If using it for the description of equipment, it must be used consistently. Refer to Para 2.11.

**Use of the element <reqQuantity>**. The project or the organization must decide and define the use of the quantity element <reqQuantity>. It is recommended to use quantity only for multiple occurrence equipment. Refer to Para 2.12.

**Use of the element <installationInfo>**. The project or the organization must decide and define the use of equipment installation information including location and position information through its child elements and attributes. If used, this element and its child elements and attributes must be populated consistently. Refer to Para 2.13.

**Use of the element <siblingPlugIdent>**. The project or the organization must decide and define the use of twin connector identification information. The twin connector identification is the identification of the mate connector for connection analysis. It is therefore recommended to define business rules for use and population of this element. Refer to Para 2.13.2.

**Use of the element <accessDoorOrPanel>**. The project or the organization must decide and define the use of the access door or panel element <accessDoorOrPanel>. If used, the element must be populated consistently. Refer to Para 2.13.3.

**Use of the element <nextHigherAssy>**. The project or the organization must decide and define the use of the next higher assembly element <nextHigherAssy>. If used, the element must be populated consistently. Refer to Para 2.13.4.

**Use of the element <positionOnNextHigherAssy>**. The project or the organization must decide and define the use of the position on next higher assembly element <positionOnNextHigherAssy> and the available attributes. If used, the attributes must be populated consistently. Refer to Para 2.13.5.

**Use of the element <equipDescrRef>**. The project or the organization must decide the use and the definition of equipment description references. If used, references must be given consistently. Refer to Para 2.14.

**Use of the element <functionalDescrRef>**. The project or the organization must decide the use and the definition of functional description references. If used, references must be given consistently. Refer to Para 2.15.

**Use of the element <illustrationRef>**. The project or the organization must decide the use and the definition of illustration references. If used, references must be given consistently. Refer to Para 2.16.

# 4 Markup examples

## 4.1 Multiple occurrence equipment

The following markup example shows the use of attribute installationIdent for multiple occurrence equipment. The equipment M35001 OXY BOX (PSU) with the reference designator M35001 is used four times in this example. The four equipment instances are connected to D35150P thru D35153P. For details refer to Fig 1.

The markup example also shows a reference to the fourth instance D35153P in the second occurrence of element <electricalEquip>.

ICN-C0419-S1000D0207-001-01

*Fig 1 Multiple occurrence equipment example*

```
<electricalEquip>
<referenceDesignator>M35001</referenceDesignator>
<installationInfo installationIdent="1">
<installationLocation installationLocationType="instloctyp03">
398</installationLocation>
<siblingPlugIdent>
<referenceDesignator>D35150P</referenceDesignator>
</siblingPlugIdent>
</installationInfo>
<installationInfo installationIdent="2">
<installationLocation installationLocationType="instloctyp03">
421</installationLocation>
<siblingPlugIdent>
<referenceDesignator>D35151P</referenceDesignator>
</siblingPlugIdent>
</installationInfo>
<installationInfo installationIdent="3">
<installationLocation installationLocationType="instloctyp03">
442</installationLocation>
<siblingPlugIdent>
<referenceDesignator>D35152P</referenceDesignator>
</siblingPlugIdent>
</installationInfo>
<installationInfo installationIdent="4">
<installationLocation installationLocationType="instloctyp03">
463</installationLocation>
<siblingPlugIdent>
<referenceDesignator>D35153P</referenceDesignator>
</siblingPlugIdent>
</installationInfo>
</electricalEquip>
<electricalEquip>
<referenceDesignator>D35153P</referenceDesignator>
<installationInfo>
<installationLocation installationLocationType="instloctyp03">
```

```
463</installationLocation>
<siblingPlugIdent>
<referenceDesignator
installationIdent="4">M35001</referenceDesignator>
</siblingPlugIdent>
</installationInfo>
</electricalEquip>
```

## 4.2 Installation location

### 4.2.1 Installation location in coded form

The following markup example shows an installation location in coded form, using the subzone.

```
<installationLocation installationLocationType="instloctyp01">
148</installationLocation>
```

### 4.2.2 Installation location in clear text

The following markup example shows an installation location in clear text.

```
<installationLocation>Side console and rear pressure bulkhead
plug break RH (rear cockpit)</installationLocation>
```

### 4.2.3 Installation location with dimensions

The following example shows the installation location of equipment by populating the element <installationLocation> with station, water line and buttock line information. The unit of measurement is centimeter.

```
<installationLocation installationLocationType="instloctyp03"
unitOfMeasure="cm">199</installationLocation>
<installationLocation installationLocationType="instloctyp04"
unitOfMeasure="cm">170</installationLocation>
<installationLocation installationLocationType="instloctyp05"
unitOfMeasure="cm">L057</installationLocation>
```

## 4.3 Position on next higher assembly

### 4.3.1 Connector

The following markup example shows connector D4532J, which is mounted on position 5 of the next higher assembly AC1650.

```
<electricalEquip equipState="active">
<referenceDesignator>D4532J</referenceDesignator>
<installationInfo>
<nextHigherAssy>
<referenceDesignator>AC1650</referenceDesignator>
</nextHigherAssy>
<positionOnNextHigherAssy mountPosition="5">
</positionOnNextHigherAssy>
</installationInfo>
</electricalEquip>
```

### 4.3.2 Circuit breaker

The following markup example shows circuit breaker CB0225, which is mounted in row C and column 7 of the next higher assembly P320.

```
<electricalEquip equipState="active">
<referenceDesignator>CB0225</referenceDesignator>
```

```
<installationInfo>
<nextHigherAssy>
<referenceDesignator>P320</referenceDesignator>
</nextHigherAssy>
<positionOnNextHigherAssy mountRow="C" mountColumn="7">
</positionOnNextHigherAssy>
</installationInfo>
</electricalEquip>
```

| Chap 3.9.5.3 | Data modules - Applicability |

## 1 General

The element <connector> and its child elements are used to capture and represent connectors, which are used for the Product, and the related standard parts information.

# 2 Element <connector> and child elements

**Description:** The element <connector> is contained in the connector list element <connectorGroup>. The list of connectors is a child element of the list of standard parts element <standardPartGroup>.

The element <connector> contains information concerning the properties of connectors used in the Product's wiring. It is also used to describe terminal modules, switches and relays.

**Markup element:** <connector> (C)

**Attributes:**

- applicRefId (O), defines the applicability of a connector by referencing the element <applic> in the referenced applicability group as described in Chap 3.9.5.3
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O) indicate change in accordance with Chap 3.9.5.2.1.1

**Child elements:**

- <partNumber> (M), the part number of the connector
- <altIdentGroup> (O), the list of alternative identifications
- <mass> (O), the mass information
- <orientation> (O), the orientation information
- <assyInstruction> (O), the assembly instruction information
- <rack> (O), the rack information
- <contactCount> (O), the contact count
- <contactDescrGroup> (O), the list of contact descriptions
- <electricalLogic> (O), the electrical logic information
- <connectorAccessories> (O), the list of accessories
- <functionalDescrRef> (O), the functional description reference
- <illustrationRef> (O), the reference to illustrations

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use and definition of applicability information for connectors
- Use and definition of change attributes for connectors

**Markup example:**

```
<wiringData>
<standardPartGroup>
<connectorGroup>
<connector>...</connector>
<connector>...</connector>
</connectorGroup>
</standardPartGroup>
</wiringData>
```

## 2.1 Part number

**Description:** The element <partNumber> contains the project or the organization specific part number of a connector. This element must be populated in accordance with Chap 3.9.5.1. The part number serves as a link to the equipment. Refer to Chap 3.9.5.2.9.4.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Definition of project or organization specific rules for the use of part numbers in this context. Refer to Chap 3.9.5.2.9.4

## 2.2 Alternative identifications

**Description:** The element <altIdentGroup> contains a list of alternative identifications for connectors, described by manufacturer part numbers and the related manufacturer. Refer to Chap 3.9.5.2.9.4.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of alternative identifications. Refer to Chap 3.9.5.2.9.4

## 2.3 Mass

**Description:** The element <mass> contains the mass of a connector.

**Markup element:** <mass> (O)

**Attributes:**

– unitOfMeasure (O), the unit of measure for the connector mass

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <mass> and its attribute unitOfMeasure

**Markup example:**

```
<mass unitOfMeasure="kg">0,0154</mass>
```

## 2.4 Orientation

**Description:** The element <orientation> contains orientation/polarization information about a connector. Polarization information is normally given as part of the connector's part number. The polarization code can represent the angle between the main keyway and the other keyways of the connector.

**Markup element:** <orientation> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <orientation>

**Markup example:**

The following markup example shows the use of element <orientation> by inserting the polarization code of the connector, eg JN1003A1335PA:

```
<orientation>A</orientation>
```

## 2.5 Assembly instructions

**Description:** The element <assyInstruction> is used as a container for the subordinate connector assembly information. Refer to Chap 3.9.5.2.9.4.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of assembly information. Refer to Chap 3.9.5.2.9.4

## 2.6 Rack

**Description:** The element <rack> contains rack information about rack & panel connectors.

**Markup element:** <rack> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <rack>

**Markup example:**

The following markup example shows the use of element <rack> for the insert A of the rack & panel connector, eg JN1123FP1CGK11:

```
<rack>A</rack>
```

## 2.7 Contact count

**Description:** The element <contactCount> contains the number of contacts of the connector.

**Markup element:** <contactCount> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the element <contactCount>

**Markup example:**

```
<contactCount>40</contactCount>
```

## 2.8 List of contact descriptions

**Description:** The element <contactDescrGroup> contains a list of contact descriptions.

**Markup element:** <contactDescrGroup> (O)

**Attributes:**

– None

**Child elements:**

– <contactDescr> (C), the contact description

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the list of contact descriptions element <contactDescrGroup>

**Markup example:**

```
<contactDescrGroup>
<contactDescr>...</contactDescr>
<contactDescr>...</contactDescr>
</contactDescrGroup>
```

### 2.8.1 Contact description

**Description:** The element <contactDescr> contains a list of contact descriptions.

**Markup element:** <contactDescr> (C)

**Attributes:**

– None

**Child elements:**

– <contact> (M), the contact identification
– <contactDiameter> (O), the contact diameter
– <finishingInfo> (O), the finishing information for the connection of wires
– <thermoCouplePlus> (O), identifies the positive contact of thermo couples
– <thermoCoupleMinus> (O), identifies the negative contact of thermo couples
– <specialTerminal> (O), the special terminal information
– <coaxialCableFlag> (O), the coaxial information
– <triaxialCableFlag> (O), the tri-axial information
– <terminationModuleGroupingValue> (O), used for contacts that belong to the same module of a termination module assembly
– <blockGroupingValue> (O), used for contacts that belong to the same block of a termination module assembly or the same pole of a switch or a relay
– <shuntGroupingValue> (O), used for contacts that belong to the same shunt/bus of a termination module or the same position of a switch or a relay

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

2.8.1.1 Contact identification

**Description:** The element <contact> describes the contact identification through its attributes. Refer to Chap 3.9.5.2.9.2.

Normally, the attribute contactFunction is not used in this context. The attributes connectedFlag and wireInstallationDirection must not be used in this context.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the contact attributes. Refer to Chap 3.9.5.2.9.2

2.8.1.2 Contact diameter

**Description:** This element describes the diameter of a contact.

**Markup element:** <contactDiameter> (O)

**Attributes:**

– unitOfMeasure (O), the unit of measure for the connector diameter

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <contactDiameter> and its attribute unitOfMeasure

**Markup example:**

The following example shows the markup of a 1,15 millimeter contact diameter.

```
<contactDiameter unitOfMeasure="mm">1,15</contactDiameter>
```

2.8.1.3 Finishing information

**Description:** The element <finishingInfo> contains the finishing information for the connection of wires to a contact. Refer to Chap 3.9.5.2.9.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <finishingInfo>. Refer to Chap 3.9.5.2.9.2

2.8.1.4 Thermo couple plus

**Description:** The element <thermoCouplePlus> identifies the positive contact of thermo couples.

**Markup element:** <thermoCouplePlus> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <thermoCouplePlus>

**Markup example:**

The following example shows the markup of a contact, which is the positive contact of a thermo couple.

```
<thermoCouplePlus>Y</thermoCouplePlus>
```

2.8.1.5 Thermo couple minus

**Description:** The element <thermoCoupleMinus> identifies the negative contact of thermo couples.

**Markup element:** <thermoCoupleMinus> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <thermoCoupleMinus>

**Markup example:**

The following example shows the markup of a contact, which is the negative contact of a thermo couple.

```
<thermoCoupleMinus>Y</thermoCoupleMinus>
```

2.8.1.6 Special terminal information

**Description:** The element <specialTerminal> identifies special terminals.

**Markup element:** <specialTerminal> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <specialTerminal>

**Markup example:**

The example shows the markup of a contact, which is a special terminal.

```
<specialTerminal>Y</specialTerminal>
```

2.8.1.7 Coaxial information

**Description:** The coax information element <coaxialCableFlag> identifies coaxial contacts.

**Markup element:** <coaxialCableFlag> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <coaxialCableFlag>

**Markup example:**

The example shows the markup of a coaxial contact.

```
<coaxialCableFlag>Y</coaxialCableFlag>
```

2.8.1.8 Tri-axial information

**Description:** The tri-axial information element <triaxialCableFlag> identifies tri-axial contacts.

**Markup element:** <triaxialCableFlag> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <triaxialCableFlag>

**Markup example:**

The example shows the markup of a tri-axial contact.

```
<triaxialCableFlag>Y</triaxialCableFlag>
```

2.8.1.9 Termination module grouping information

**Description:** The element <terminationModuleGroupingValue> identifies the terminal modules on a mounting rail. Refer to Chap 3.9.5.2.9.2.

**Markup element:** <`terminationModuleGroupingValue`> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <`terminationModuleGroupingValue`>. Refer to Chap 3.9.5.2.9.2

**Markup example:**

Refer to Para 4.

2.8.1.10 Block grouping information

**Description:** The element <`blockGroupingValue`> contains the block information of terminal modules. Refer to Chap 3.9.5.2.9.2.

**Markup element:** <`blockGroupingValue`> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <`blockGroupingValue`>. Refer to Chap 3.9.5.2.9.2

**Markup example:**

Refer to Para 4.

2.8.1.11 Shunt grouping information

**Description:** The element <`shuntGroupingValue`> is used to divide contacts of terminal modules, which are electrically connected, into groups, the busses. Refer to Chap 3.9.5.2.9.2.

**Markup element:** <`shuntGroupingValue`> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <shuntGroupingValue>. Refer to Chap 3.9.5.2.9.2

**Markup example:**

Refer to Para 4.

## 2.9 Electrical logic

**Description:** In this context, the electrical logic element <electricalLogic> provides an optional container for electrical states and internal connections between contacts for standard parts. Refer to Chap 3.9.5.2.9.4.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of electrical logic information. Refer to Chap 3.9.5.2.9.4

## 2.10 List of accessories

**Description:** The element <connectorAccessories> contains the part numbers of accessories for the connector.

**Markup element:** <connectorAccessories> (O)

**Attributes:**

– None

**Child elements:**

– <partNumber> (C), the part number of an accessory. Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the list of accessories for a connector

**Markup example:**

The following markup example shows the use of element <connectorAccessories> for the connector JN1003FG22-35PN1

```
<connectorAccessories>
<partNumber>JN1003P22</partNumber>
<partNumber>JN1003C22</partNumber>
<partNumber>JN1003D22</partNumber>
<partNumber>JN1003K22</partNumber>
<partNumber>JN1003L22</partNumber>
<partNumber>JN1003MA22</partNumber>
<partNumber>JN1003MB22</partNumber>
<partNumber>JN1003MF22</partNumber>
<partNumber>JN1003N22</partNumber>
</connectorAccessories>
```

## 2.11 Functional description reference

**Description:** The functional description reference element <functionalDescrRef> contains references to other parts of the electrical system publications for further information about a connector, eg a description of how it is made (specification of the connector). References must be populated in accordance with Chap 3.9.5.2.1.2.

**Markup element:** <functionalDescrRef> (O)

**Attributes:**

– None

**Child elements:**

– <refs> (C), the functional description reference information. Refer to Chap 3.9.5.2.1.2

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of functional description references for connectors

## 2.12 Illustration reference

**Description:** The illustration reference element <illustrationRef> contains references to other parts of the electrical system publications, which show illustrations of the connector. References must be populated in accordance with Chap 3.9.5.2.1.2.

**Markup element:** <illustrationRef> (O)

**Attributes:**

– None

**Child elements:**

– <refs> (C), the illustration reference information. Refer to Chap 3.9.5.2.1.2

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of illustration references for connectors

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use and definition of applicability information**. The project or the organization must decide the use and the definition of applicability information for a connector. In normal cases, it is not necessary to use connector applicability. If used, it must be defined precisely and populated consistently in accordance with the project or the organization specific rules. Refer to Para 2.

**Use and definition of change attributes**. The project or the organization must decide the use and the definition of change attributes for connector data. Refer to Para 2.

**Use of the element <partNumber>**. The project or the organization must define rules for the use of part numbers in this context. Refer to Para 2.1.

**Use of the element <altIdentGroup>**. The project or the organization must decide and define the use of alternative identifications. Refer to Chap 3.9.5.2.9.4 and Para 2.2.

**Use of the element <mass>**. The project or the organization must decide and define the use of the element <mass> and the attribute unitOfMeasure. If used, this element and its attribute must be populated consistently. Refer to Para 2.3.

**Use of the element <orientation>**. The project or the organization must decide and define the use of the orientation element <orientation>. If used, this element must be populated consistently. Refer to Para 2.4.

**Use of the element <assyInstruction>**. The project or the organization must decide and define the use of connector assembly information. Refer to Chap 3.9.5.2.9.4 and Para 2.5.

**Use of the element <rack>**. The project or the organization must decide and define the use of element <rack>. If a project or an organization uses the part number of the complete rack & panel connector to describe the different inserts, then the element <rack> must be used to define which insert of the connector is described in this context. A connector element is required for all inserts of the rack & panel connector. If used, the element <rack> must be populated consistently. Refer to Para 2.6.

**Use of the element <contactCount>**. The project or the organization must decide whether to use the element <contactCount> or not. Refer to Para 2.7.

**Use of the element <contactDescrGroup>**. The project or the organization must decide whether to use the list of contact descriptions or not. If used, then the project or the organization must also decide the use and the definition of the following child elements, up to and including the element <shuntGroupingValue>. Refer to Para 2.8.

**Use of the element <contactDiameter>**. The project or the organization must decide the use and the definition of the contact diameter element <contactDiameter>. If used, this element must be defined precisely and populated consistently in accordance with the project or the organization specific rules. Refer to Para 2.8.1.2.

**Use of the element <finishingInfo>**. The project or the organization must decide the use and the definition of the finishing information element <finishingInfo>. Refer to Para 2.8.1.3.

**Use of the element <thermoCouplePlus>**. The project or the organization must decide the use and the definition of the thermo couple plus element <thermoCouplePlus>. It is recommended to identify thermo couple contacts by populating this element with the value "Y". If the contact is not a thermo couple plus, this element can be populated with the value "N". It is also possible not to use it for non-thermo couple contacts. If used, this element must be populated consistently. Refer to Para 2.8.1.4.

**Use of the element <thermoCoupleMinus>**. The project or the organization must decide the use and the definition of the thermo couple minus element <thermoCoupleMinus>. It is recommended to identify thermo couple contacts by populating this element with the value "Y". If the contact is not a thermo couple minus, this element can be populated with the value "N". It is also possible not to use it for non-thermo couple contacts. If used, this element must be populated consistently. Refer to Para 2.8.1.5.

**Use of the element <specialTerminal>**. The project or the organization must decide the use and the definition of the special terminals element <specialTerminal>. It is recommended to define all special terminals and to identify them by populating this element with the value "Y". If the contact is not a special terminal, this element can be populated with the value "N". It is also possible not to use it for non-special terminals. If used, this element must be populated consistently. Refer to Para 2.8.1.6.

**Use of the element <coaxialCableFlag>**. The project or the organization must decide the use and the definition of the coaxial information element <coaxialCableFlag>. It is recommended to identify coaxial contacts by populating this element with the value "Y". If the contact is not a coaxial contact, this element can be populated with the value "N". It is also possible not to use it then. If used, this element must be populated consistently. Refer to Para 2.8.1.7.

**Use of the element <triaxialCableFlag>**. The project or the organization must decide the use and the definition of the tri-axial information element <triaxialCableFlag>. It is recommended to identify tri-axial contacts by populating this element with the value "Y". If the contact is not a tri-axial contact, this element can be populated with the value "N". It is also possible not to use it then. If used, this element must be populated consistently. Refer to Para 2.8.1.8.

**Use of the element <terminationModuleGroupingValue>**. The project or the organization must decide the use and the definition of the termination module element <terminationModuleGroupingValue>. Normally, the population of this element depends on project or organization specific rules. If possible, this element gets allocated the same value, which is used for coding of the termination module element <terminationModuleGroupingValue> as child element of the electrical potential element <electricalPotential> in the wire connection code. Refer to Chap 3.9.5.2.9.2 and Para 2.8.1.9.

**Use of the element <blockGroupingValue>**. The project or the organization must decide the use and the definition of the block element <blockGroupingValue>. Normally, the population of this element depends on project or organization specific rules. If possible, this element gets allocated the same value, which is used for coding of the block element <blockGroupingValue>as child element of the electrical potential element <electricalPotential> in the wire connection code. Refer to Chap 3.9.5.2.9.2 and Para 2.8.1.10.

**Use of the element <shuntGroupingValue>**. The project or the organization must decide the use and the definition of the shunt element <shuntGroupingValue>. Normally, the population of this element depends on project or organization specific rules and represents the busses of the termination module. If possible, this element gets allocated the same value, which is used for coding of the shunt element <shuntGroupingValue> as child element of the electrical potential element <electricalPotential> in the wire connection code. Refer to Chap 3.9.5.2.9.2 and Para 2.8.1.11.

**Use of the element <electricalLogic>**. The project or the organization must decide whether to use the element <electricalLogic> or not. Refer to Chap 3.9.5.2.9.4 and Para 2.9.

**Use of the element <connectorAccessories>**. The project or the organization must decide and define the use of the list of accessories element <connectorAccessories>. For connectors, more than one accessory of the same kind can be available, eg cable clamps with different angular positions. In this case, the project or the organization must decide whether they add all possible accessories to the connector or not. In the first case, more than one cable clamp appears in the list of accessories, or different connector containers are used for the same connector, listing only one accessory of the same kind. The second method can generate a considerable amount of connector data. Therefore it is recommended to list all available accessories in one data set. Refer to Para 2.10.

**Use of the element <functionalDescrRef>**. The project or the organization must decide the use and the definition of functional description references. If used, references must be given consistently. Refer to Para 2.11.

**Use of the element <illustrationRef>**. The project or the organization must decide the use and the definition of illustration references. If used, references must be given consistently, eg all connectors get allocated a reference to a data module that shows the insert arrangement of the connector. Refer to Para 2.12.

# 4 Examples

The following markup example shows the use of the element <contactDescrGroup> for a terminal junction module with two busses, 1-2 and 3-4, and four contacts of the diameter 1,15 mm.

```
<contactDescrGroup>
<contactDescr>
<contact contactIdent="1"/>
<contactDiameter unitOfMeasure="mm">1,15</contactDiameter>
<thermoCouplePlus>N</thermoCouplePlus>
<thermoCoupleMinus>N</thermoCoupleMinus>
<specialTerminal>N</specialTerminal>
<coaxialCableFlag>N</coaxialCableFlag>
<triaxialCableFlag>N</triaxialCableFlag>
<terminationModuleGroupingValue>1
</terminationModuleGroupingValue>
<blockGroupingValue>1</blockGroupingValue>
<shuntGroupingValue>1</shuntGroupingValue>
</contactDescr>
<contactDescr>
<contact contactIdent="2"/>
<contactDiameter unitOfMeasure="mm">1,15</contactDiameter>
<thermoCouplePlus>N</thermoCouplePlus>
<thermoCoupleMinus>N</thermoCoupleMinus>
<specialTerminal>N</specialTerminal>
<coaxialCableFlag>N</coaxialCableFlag>
<triaxialCableFlag>N</triaxialCableFlag>
<terminationModuleGroupingValue>1
</terminationModuleGroupingValue>
<blockGroupingValue>1</blockGroupingValue>
<shuntGroupingValue>1</shuntGroupingValue>
</contactDescr>
<contactDescr>
<contact contactIdent="3"/>
<contactDiameter unitOfMeasure="mm">1,15</contactDiameter>
<thermoCouplePlus>N</thermoCouplePlus>
<thermoCoupleMinus>N</thermoCoupleMinus>
<specialTerminal>N</specialTerminal>
<coaxialCableFlag>N</coaxialCableFlag>
<triaxialCableFlag>N</triaxialCableFlag>
<terminationModuleGroupingValue>1
</terminationModuleGroupingValue>
<blockGroupingValue>1</blockGroupingValue>
<shuntGroupingValue>2</shuntGroupingValue>
</contactDescr>
<contactDescr>
<contact contactIdent="4"/>
<contactDiameter unitOfMeasure="mm">1,15</contactDiameter>
<thermoCouplePlus>N</thermoCouplePlus>
<thermoCoupleMinus>N</thermoCoupleMinus>
<specialTerminal>N</specialTerminal>
<coaxialCableFlag>N</coaxialCableFlag>
<triaxialCableFlag>N</triaxialCableFlag>
<terminationModuleGroupingValue>1
</terminationModuleGroupingValue>
<blockGroupingValue>1</blockGroupingValue>
<shuntGroupingValue>2</shuntGroupingValue>
</contactDescr>
</contactDescrGroup>
```

# 1 General

The element <distributionPart> and its child elements are used to capture and represent distribution parts, which are used for the Product, and the related standard parts information.

# 2 Element <distributionPart> and child elements

**Description:** The element <distributionPart> is contained in the list of distribution parts element <distributionPartGroup>. The list of distribution parts is a child element of the list of the standard parts element <standardPartGroup>.

It contains information concerning the properties of distribution parts, like contacts and splices, used in the Product's wiring.

**Markup element:** <distributionPart> (C)

**Attributes:**

- applicRefId (O), defines the applicability of a distribution part by referencing the element <applic> in the referenced applicability group as described in Chap 3.9.5.3
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O) indicate change in accordance with Chap 3.9.5.2.1.1

**Child elements:**

- <partNumber> (M), the part number of the distribution part
- <altIdentGroup> (O), the list of alternative identifications
- <contactSize> (O), the contact size
- <material> (O), the material information
- <mass> (O), the mass of the distribution part
- <wireColor> (O), the color information
- <surfaceProtection> (O), the surface protection information
- <contactDiameter> (O), the contact diameter
- <temperature> (O), the temperature information
- <functionalDescrRef> (O), the functional description reference
- <illustrationRef> (O), the reference to illustrations

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use and definition of applicability information for distribution parts
- Use and definition of change attributes for distribution parts

**Markup example:**

```
<wiringData>
<standardPartGroup>
<distributionPartGroup>
<distributionPart>...</distributionPart>
<distributionPart>...</distributionPart>
</distributionPartGroup>
</standardPartGroup>
</wiringData>
```

## 2.1 Part number

**Description:** The part number element <partNumber> contains the project or the organization specific part number of a distribution part. This element must be populated in accordance with Chap 3.9.5.1. The part number serves as a link to the equipment. Refer to Chap 3.9.5.2.9.4.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Definition of project or organization specific rules for the use of part numbers in this context. Refer to Chap 3.9.5.2.9.4

**Markup example:**

The following markup example shows the use of the element <partNumber> for a splice with part number PAN6466A.

```
<partNumber>PAN6466A</partNumber>
```

## 2.2 Alternative identifications

**Description:** The element <altIdentGroup> contains a list of alternative identifications for distribution parts, described by manufacturer part numbers and the related manufacturer. Refer to Chap 3.9.5.2.9.4.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of alternative identifications. Refer to Chap 3.9.5.2.9.4

## 2.3 Contact size

**Description:** The element <contactSize> contains size information about a distribution part, normally for a contact.

**Markup element:** <contactSize> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <contactSize>

**Markup example:**

The following markup example shows the use of the element <contactSize> for a contact of the size 12, eg JN1003S12.

```
<contactSize>12</contactSize>
```

## 2.4 Material

**Description:** The element <material> describes the material of which the distribution part is made.

**Markup element:** <material> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <material>

**Markup example:**

The following markup example shows the use of the element <material> for a distribution part made of copper alloy.

```
<material>Copper alloy</material>
```

## 2.5 Mass

**Description:** The element <mass> contains the mass information of a distribution part. If used, this element must be populated in accordance with Chap 3.9.5.2.9.5.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <mass> and its attribute unitOfMeasure

## 2.6 Color

**Description:** The element <wireColor> contains the color information of a distribution part. This element can be used to indicate the color codes (color bands) of contacts or splices. If used, it must be populated in accordance with Chap 3.9.5.2.9.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <wireColor>

**Markup example:**

The following markup example shows the use of the element <wireColor> for a contact with a three-color band of the colors orange, blue and green.

```
<wireColor>Orange/Blue/Green</wireColor>
```

## 2.7 Protection

**Description:** The element <surfaceProtection> contains the protection information applied to the surface of a distribution part.

**Markup element:** <surfaceProtection> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <surfaceProtection>

**Markup example:**

The following markup example shows the use of the element <surfaceProtection> for a gold plated contact.

```
<surfaceProtection>Gold plated</surfaceProtection>
```

## 2.8 Contact diameter

**Description:** The element <contactDiameter> describes the diameter of a distribution part, normally for contacts. If used, this element must be populated in accordance with Chap 3.9.5.2.9.5.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <contactDiameter> and its attribute unitOfMeasure

**Markup example:**

The following markup example shows the use of the element <contactDiameter> for a contact of the size 12 (outer diameter = 2,41mm).

```
<contactDiameter unitOfMeasure="mm">2,41</contactDiameter>
```

## 2.9 Temperature

**Description:** The element <temperature> describes the minimum and maximum temperature, for which the distribution part is approved. If used, this element must be populated in accordance with Chap 3.9.5.2.9.3.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <temperature> and its child elements

**Markup example:**

The following markup example shows the use of the element <temperature> for a distribution part, which is approved for temperatures from –55°C to 150°C.

```
<temperature>
<minTemperature unitOfMeasure="degC">-55</minTemperature>
<maxTemperature unitOfMeasure="degC">150</maxTemperature>
</temperature>
```

## 2.10 Functional description reference

**Description:** The functional description reference element <functionalDescrRef> contains references to other parts of the electrical system publications for further information

about a distribution part, eg a description of how it is made (specification of the distribution part). References must be populated in accordance with Chap 3.9.5.2.1.2.

**Markup element:** <functionalDescrRef> (O)

**Attributes:**

– None

**Child elements:**

– <refs> (C), the functional description reference information. Refer to Chap 3.9.5.2.1.2

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of functional description references for distribution parts

## 2.11 Illustration reference

**Description:** The illustration reference element <illustrationRef> contains references to other parts of the systems publications, which show illustrations of the distribution part.

**Description:** The Illustration reference element <illustrationRef> contains references to other parts of the electrical system publications, which show illustrations of the distribution part. References must be populated in accordance with Chap 3.9.5.2.1.2.

**Markup element:** <illustrationRef> (O)

**Attributes:**

– None

**Child elements:**

– <refs> (C), the illustration reference information. Refer to Chap 3.9.5.2.1.2

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of illustration references for distribution parts

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use and definition of applicability information**. The project or the organization must decide the use and the definition of applicability information for a distribution part. In normal cases, it is not necessary to use distribution part applicability. If used, it must be defined precisely and populated consistently in accordance with the project or the organization specific rules. Refer to Para 2.

**Use and definition of change attributes**. The project or the organization must decide the use and the definition of change attributes for distribution parts data. Refer to Para 2.

**Use of the element <partNumber>**. The project or the organization must define rules for the use of part numbers in this context. Refer to Para 2.1.

**Use of the element <altIdentGroup>**. The project or the organization must decide and define the use of alternative identifications. Refer to Chap 3.9.5.2.9.4 and Para 2.2.

**Use of the element <`contactSize`>**. The project or the organization must decide and define the use of contact size information for distribution parts. If used, this element must be populated consistently. Refer to Para 2.3.

**Use of the element <`material`>**. The project or the organization must decide and define the use of material information for distribution parts. If used, this element must be populated consistently. Refer to Para 2.4.

**Use of the element <`mass`>**. The project or the organization must decide and define the use of this element its attribute `unitOfMeasure`. If used, mass information must be populated consistently. Refer to Chap 3.9.5.2.9.5 and Para 2.5.

**Use of the element <`wireColor`>**. The project or the organization must decide and define the use of color information for distribution parts. If used, this element must be populated consistently. Refer to Chap 3.9.5.2.9.2 and Para 2.6.

**Use of the element <`surfaceProtection`>**. The project or the organization must decide and define the use of the protection element <`surfaceProtection`>. If used, it must be populated consistently. Refer to Para 2.7.

**Use of the element <`contactDiameter`>**. The project or the organization must decide the use and the definition of the contact diameter. If used, the element must be defined precisely (definition, which diameter has to be inserted) and populated consistently in accordance with the project or the organization specific rules. Refer to Para 2.8.

**Use of the element <`temperature`>**. The project or the organization must decide the use and the definition of the child elements for the temperature information. If used, they must be populated consistently in accordance with the project or the organization specific rules. Refer to Chap 3.9.5.2.9.3 and Para 2.9.

**Use of the element <`functionalDescrRef`>**. The project or the organization must decide the use and the definition of functional description references. If used, references must be given consistently. Refer to Para 2.10.

**Use of the element <`illustrationRef`>**. The project or the organization must decide the use and the definition of illustration references. If used, references must be given consistently, eg all distribution parts have allocated a reference to a data module that shows an illustration of the distribution part. Refer to Para 2.11.

| Chap 3.9.5.3 | Data modules - Applicability |

## 1 General

The element <accessory> and its child elements are used to capture and represent accessories, which are used for the Product, and the related standard parts information.

## 2 Element <accessory> and child elements

**Description:** The element <accessory> is contained in the list of accessories element <accessoryGroup>. The list of accessories is a child element of the list of the standard parts element <standardPartGroup>.

It contains information concerning the properties of accessories used in the Product's wiring.

**Markup element:** <accessory> (C)

**Attributes:**

- applicRefId (O), defines the applicability of an accessory by referencing the element <applic> in the referenced applicability group as described in Chap 3.9.5.3
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O) indicate change in accordance with Chap 3.9.5.2.1.1

**Child elements:**

- <partNumber> (M), the part number of the accessory
- <altIdentGroup> (O), the list of alternative identifications
- <mass> (O), the mass of the accessory
- <orientation> (O), the orientation information
- <assyInstruction> (O), the assembly instruction information
- <functionalDescrRef> (O), the functional description reference
- <illustrationRef> (O), the reference to illustrations

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use and definition of applicability information for accessories
- Use and definition of change attributes for accessories

**Markup example:**

```
<wiringData>
<standardPartGroup>
<accessoryGroup>
<accessory>...</accessory>
<accessory>...</accessory>
</accessoryGroup>
</standardPartGroup>
</wiringData>
```

## 2.1 Part number

**Description:** The element <partNumber> contains the project or the organization specific part number of an accessory. This element must be populated in accordance with Chap 3.9.5.1. The part number is the link of the accessory with its properties to the list of accessories element <connectorAccessories>. Refer to Chap 3.9.5.2.9.5.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Definition of project or organization specific rules for the use of part numbers in this context. Refer to Chap 3.9.5.2.9.5

## 2.2 Alternative identifications

**Description:** The element <altIdentGroup> contains alternative identifications of an accessory, described by manufacturer part numbers and the related manufacturer. Refer to Chap 3.9.5.2.9.5.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of alternative identifications. Refer to Chap 3.9.5.2.9.5

## 2.3 Mass

**Description:** The element <mass> contains the mass information of an accessory. If used, this element must be populated in accordance with Chap 3.9.5.2.9.5.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <mass> and its attribute unitOfMeasure

## 2.4 Orientation

**Description:** The element <orientation> contains orientation information of an accessory. Orientation information of accessories is normally part of the accessory part number in coded form. The orientation can represent the angle of a cable clamp. If used, this element must be populated in accordance with Chap 3.9.5.2.9.5.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <orientation>

**Markup example:**

The following markup example shows the use of the element <orientation> to indicate the orientation of a 90° cable clamp.

```
<orientation>90</orientation>
```

## 2.5 Assembly instructions

**Description:** The element <assyInstruction> is used as a container for the subordinate accessory assembly information. Refer to Chap 3.9.5.2.9.5.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of assembly information. Refer to Chap 3.9.5.2.9.5

## 2.6 Functional description reference

**Description:** The functional description reference element <functionalDescrRef> contains references to other parts of the electrical system publications for further information about an accessory, eg a description of how it is made (specification of the accessory). References must be populated in accordance with Chap 3.9.5.2.1.2.

**Markup element:** <functionalDescrRef> (O)

**Attributes:**

– None

**Child elements:**

– <refs> (C), the functional description reference information. Refer to Chap 3.9.5.2.1.2

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of functional description references for accessories

## 2.7 Illustration reference

**Description:** The Illustration reference element <`illustrationRef`> contains references to other parts of the electrical system publications, which show illustrations of the accessory. References must be populated in accordance with Chap 3.9.5.2.1.2.

**Markup element:** <`illustrationRef`> (O)

**Attributes:**

– None

**Child elements:**

– <`refs`> (C), the illustration reference information. Refer to Chap 3.9.5.2.1.2

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of illustration references for accessories

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use and definition of applicability information**. The project or the organization must decide the use and the definition of applicability information for an accessory. In normal cases, it is not necessary to use accessory applicability. If used, it must be defined precisely and populated consistently in accordance with the project or the organization specific rules. Refer to Para 2.

**Use and definition of change attributes**. The project or the organization must decide the use and the definition of change attributes for accessory data. Refer to Para 2.

**Use of the element <`partNumber`>**. The project or the organization must define rules for the use of part numbers in this context. Refer to Para 2.1.

**Use of the element <`altIdentGroup`>**. The project or the organization must decide and define the use of alternative identifications. Refer to Chap 3.9.5.2.9.5 and Para 2.2.

**Use of the element <`mass`>**. The project or the organization must decide and define the use of the element <`mass`> and the attribute `unitOfMeasure`. If used, this element and its attribute must be populated consistently. Refer to Para 2.3.

**Use of the element <`orientation`>**. The project or the organization must decide and define the use of the orientation element <`orientation`>. If used, this element must be populated consistently. Refer to Para 2.4.

**Use of the element <`assyInstruction`>**. The project or the organization must decide and define the use of accessory assembly information. Refer to Chap 3.9.5.2.9.5 and Para 2.5.

**Use of the element <`functionalDescrRef`>**. The project or the organization must decide the use and the definition of functional description references. If used, references must be given consistently. Refer to Para 2.6.

**Use of the element <`illustrationRef`>**. The project or the organization must decide the use and the definition of illustration references. If used, references must be given consistently, eg all accessories have allocated a reference to a data module, which shows an illustration of the accessory. Refer to Para 2.7.

## 1 General

The element <solderSleeve> and its child elements are used to capture and represent solder sleeves that are used for the Product, and the related standard parts information.

## 2 Description of element <solderSleeve> and child elements

**Description:** The element <solderSleeve> is contained in the list of solder sleeves element <solderSleeveGroup>. The list of solder sleeves is a child element of the list of the standard parts element <standardPartGroup>.

It contains information concerning the properties of solder sleeves used in the Product's wiring.

**Markup element:** <solderSleeve> (C)

**Attributes:**

- applicRefId (O), defines the applicability of a solder sleeve by referencing the element <applic> in the referenced applicability group as described in Chap 3.9.5.3
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O) indicate change in accordance with Chap 3.9.5.2.1.1

**Child elements:**

- <partNumber> (M), the part number of the solder sleeve
- <altIdentGroup> (O), the list of alternative identifications
- <length> (O), the length of the solder sleeve
- <material> (O), the material of the solder sleeve
- <mass> (O), the mass of the solder sleeve
- <sleeveDiameter> (O), the sleeve diameter
- <functionalDescrRef> (O), the functional description reference
- <illustrationRef> (O), the reference to illustrations

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use and definition of applicability information for solder sleeves
- Use and definition of change attributes for solder sleeves

**Markup example:**

```
<wiringData>
<standardPartGroup>
<solderSleeveGroup>
<solderSleeve>...</solderSleeve>
<solderSleeve>...</solderSleeve>
</solderSleeveGroup>
</standardPartGroup>
</wiringData>
```

## 2.1 Part number

**Description:** The element <partNumber> contains the project or the organization specific part number of a solder sleeve. This element must be populated in accordance with Chap 3.9.5.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Definition of project or organization specific rules for the use of part numbers in this context. Refer to Chap 3.9.5.2.9.5

## 2.2 Alternative identifications

**Description:** The element <altIdentGroup> contains alternative identifications of a solder sleeve, described by manufacturer part numbers and the related manufacturer. Refer to Chap 3.9.5.2.9.5.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of alternative identifications. Refer to Chap 3.9.5.2.9.5

## 2.3 Length

**Description:** The element <length> contains the length information of a solder sleeve.

**Note**

The attribute wireLengthType provides additional length information for wires. It must not be used to describe the length of solder sleeves.

**Markup element:** <length> (O)

**Attributes:**

– unitOfMeasure (O), the unit of measure for the solder sleeve length
– wireLengthType (O), the type of wire length, must not be used for solder sleeves

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <length> and its attribute unitOfMeasure

**Markup example:**

The following markup example shows the use of element <length> to provide length information for the solder sleeve with part number PAN6468A.

```
<length unitOfMeasure="mm">14,23</length>
```

## 2.4 Material

**Description:** The element <material> describes the material of which a solder sleeve is made.

**Markup element:** <material> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <material>

**Markup example:**

```
<material>Nickel</material>
```

## 2.5 Mass

**Description:** The element <mass> contains the mass information of a solder sleeve. If used, this element must be populated in accordance with Chap 3.9.5.2.9.5.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <mass> and its attribute unitOfMeasure

**Markup example:**

```
<mass unitOfMeasure="g">0,226</mass>
```

## 2.6 Sleeve diameter

**Description:** The element <sleeveDiameter> describes minimum and maximum diameter information for a solder sleeve.

**Markup element:** <sleeveDiameter> (O)

**Attributes:**

– None

**Child elements:**

– <minDiameter> (O), the minimum diameter of a solder sleeve
– <maxDiameter> (O), the maximum diameter of a solder sleeve

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and of the element <sleeveDiameter> for solder sleeves

**Markup example:**

The following markup example shows the use of element <sleeveDiameter> and its child elements to provide entry diameter information for a solder sleeve.

```
<sleeveDiameter>
<minDiameter unitOfMeasure="mm">2,04</minDiameter>
<maxDiameter unitOfMeasure="mm">5,08</maxDiameter>
</sleeveDiameter>
```

### 2.6.1 Minimum sleeve diameter

**Description:** The element <minDiameter> gives the minimum diameter of a solder sleeve.

**Markup element:** <minDiameter> (O)

**Attributes:**

– unitOfMeasure (O), the unit of measure for the solder sleeve diameter

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the element <minDiameter> and its attribute unitOfMeasure

### 2.6.2 Maximum sleeve diameter

**Description:** The element <maxDiameter> gives the maximum diameter of a solder sleeve.

**Markup element:** <maxDiameter> (O)

**Attributes:**

– unitOfMeasure (O), the unit of measure for the solder sleeve diameter

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the element <maxDiameter> and its attribute unitOfMeasure

## 2.7 Functional description reference

**Description:** The functional description reference element <functionalDescrRef> contains references to other parts of the electrical system publications for further information about a solder sleeve, eg a description of how it is made (specification of the sleeve). References must be populated in accordance with Chap 3.9.5.2.1.2.

**Markup element:** <functionalDescrRef> (O)

**Attributes:**

– None

**Child elements:**

– <refs> (C), the functional description reference information. Refer to Chap 3.9.5.2.1.2

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of functional description references for solder sleeves

## 2.8 Illustration reference

**Description:** The Illustration reference element <illustrationRef> contains references to other parts of the electrical system publications, which show illustrations of the solder sleeve. References must be populated in accordance with Chap 3.9.5.2.1.2.

**Markup element:** <illustrationRef> (O)

**Attributes:**

– None

**Child elements:**

– <refs> (C), the illustration reference information. Refer to Chap 3.9.5.2.1.2

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of illustration references for solder sleeves

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use and definition of applicability information**. The project or the organization must decide the use and the definition of applicability information for a solder sleeve. In normal cases, it is not necessary to use applicability information for solder sleeves. If used, it must be defined precisely and populated consistently in accordance with the project or the organization specific rules. Refer to Para 2.

**Use and definition of change attributes**. The project or the organization must decide the use and the definition of change attributes for solder sleeve data. Refer to Para 2.

**Use of the element <partNumber>**. The project or the organization must define rules for the use of part numbers in this context. Refer to Para 2.1.

**Use of the element <altIdentGroup>**. The project or the organization must decide and define the use of alternative identifications. Refer to Chap 3.9.5.2.9.5 and Para 2.2.

**Use of the element <length>**. The project or the organization must decide and define the use of the length element <length> and the attribute unitOfMeasure. If used, this element and its attribute must be populated consistently. Refer to Para 2.3.

**Use of the element <material>**. The project or the organization must decide and define the use of material information for solder sleeves. If used, this element must be populated consistently. Refer to Para 2.4.

**Use of the element <mass>**. The project or the organization must decide and define the use of the element <mass> and the attribute unitOfMeasure. If used, this element and its attribute must be populated consistently. Refer to Para 2.5.

**Use of the element <sleeveDiameter>**. The project or the organization must decide the use and the definition of sleeve diameter information. Solder sleeves are normally defined by using several diameters, eg diameters of the sleeve or entry diameters. If used, it must be defined, which diameter is provided. The element <sleeveDiameter> and its child elements, if used, must then be populated in accordance with the defined project or organization specific rules consistently. Refer to Para 2.6.

**Use of the element <functionalDescrRef>**. The project or the organization must decide the use and the definition of functional description references. If used, references must be given consistently. Refer to Para 2.7.

**Use of the element <illustrationRef>**. The project or the organization must decide the use and the definition of illustration references. If used, references must be given consistently, eg all solder sleeves have allocated a reference to a data module, which shows an illustration of the solder sleeve. Refer to Para 2.8.

# 1 General

The element <shrinkSleeve> and its child elements are used to capture and represent shrink sleeves, which are used for the Product, and the related standard parts information.

# 2 Element <shrinkSleeve> and child elements

**Description:** The element <shrinkSleeve> is contained in the list of shrink sleeves element <shrinkSleeveGroup>. The list of shrink sleeves is a child element of the list of the standard parts element <standardPartGroup>.

It contains information concerning the properties of shrink sleeves used in the Product's wiring.

**Markup element:** <shrinkSleeve> (C)

**Attributes:**

- applicRefId (O), defines the applicability of a shrink sleeve by referencing the element <applic> in the referenced applicability group as described in Chap 3.9.5.3
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O) indicate change in accordance with Chap 3.9.5.2.1.1

**Child elements:**

- <partNumber> (M), the part number of the shrink sleeve
- <altIdentGroup> (O), the list of alternative identifications
- <size> (O), the size information of the shrink sleeve
- <mass> (O), the mass of the shrink sleeve
- <wireColor> (O), the color information of the shrink sleeve
- <sleeveDiameter> (O), the sleeve diameter
- <temperature> (O), the temperature information
- <harnessSize> (O), the harness size
- <functionalDescrRef> (O), the functional description reference
- <illustrationRef> (O), the reference to illustrations

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use and definition of applicability information for shrink sleeves
- Use and definition of change attributes for shrink sleeves

**Markup example:**

```
<wiringData>
<standardPartGroup>
<shrinkSleeveGroup>
<shrinkSleeve>...</shrinkSleeve>
<shrinkSleeve>...</shrinkSleeve>
</shrinkSleeveGroup>
</standardPartGroup>
</wiringData>
```

## 2.1 Part number

**Description:** The element <partNumber> contains the project or the organization specific part number of a shrink sleeve. This element must be populated in accordance with Chap 3.9.5.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Definition of project or organization specific rules for the use of part numbers in this context. Refer to Chap 3.9.5.2.9.5

## 2.2 Alternative identifications

**Description:** The element <altIdentGroup> contains alternative identifications of a shrink sleeve, described by manufacturer part numbers and the related manufacturer. Refer to Chap 3.9.5.2.9.5.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of alternative identifications. Refer to Chap 3.9.5.2.9.5

## 2.3 Size

**Description:** The element <size> contains the size information of a shrink sleeve.

**Markup element:** <size> (O)

**Attributes:**

– unitOfMeasure (O), the unit of measure for the shrink sleeve size

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <size> and its attribute unitOfMeasure

**Markup example:**

```
<size unitOfMeasure="in">3/16</size>
```

## 2.4 Mass

**Description:** The element <mass> contains the mass information of a shrink sleeve. If used, this element must be populated in accordance with Chap 3.9.5.2.9.5.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <mass> and its attribute unitOfMeasure

**Markup example:**

```
<mass unitOfMeasure="kg/m">0,350</mass>
```

## 2.5 Color

**Description:** The element <wireColor> contains the color information of a shrink sleeve. If used, it must be populated in accordance with Chap 3.9.5.2.9.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <wireColor>

**Markup example:**

```
<wireColor>Transparent</wireColor>
```

## 2.6 Sleeve diameter

**Description:** The element <sleeveDiameter> describes minimum and maximum diameter information for a shrink sleeve. Shrink sleeves are normally defined by using diameter information before and after shrinking.

**Markup element:** <sleeveDiameter> (O)

**Attributes:**

– None

**Child elements:**

– <minDiameter> (O), the minimum diameter of a shrink sleeve. Refer to Chap 3.9.5.2.9.8
– <maxDiameter> (O), the maximum diameter of a shrink sleeve. Refer to Chap 3.9.5.2.9.8

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and of the element <sleeveDiameter> for shrink sleeves

**Markup example:**

The following markup example shows the use of element <sleeveDiameter> for a shrink sleeve. The minimum diameter contains the minimum diameter before shrinking, the maximum diameter contains the maximum diameter after shrinking.

```
<sleeveDiameter>
<minDiameter unitOfMeasure="mm">1,6</minDiameter>
<maxDiameter unitOfMeasure="mm">0,8</maxDiameter>
</sleeveDiameter>
```

## 2.7 Temperature

**Description:** The element <temperature> describes the minimum and maximum temperature, for which the shrink sleeve is approved. If used, this element must be populated in accordance with Chap 3.9.5.2.9.3.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <temperature> and its child elements

**Markup example:**

The following markup example shows the use of element <temperature> to provide the approved operating temperature information for a shrink sleeve.

```
<temperature>
<minTemperature unitOfMeasure="degC">-55</minTemperature>
<maxTemperature unitOfMeasure="degC">175</maxTemperature>
</temperature>
```

## 2.8 Harness size

**Description:** The element <harnessSize> describes the minimum and the maximum size of the harness, to which a shrink sleeve can be applied.

**Markup element:** <harnessSize> (O)

**Attributes:**

– None

**Child elements:**

– <minHarnessSize> (O), the minimum harness size
– <maxHarnessSize> (O), the maximum harness size

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and of the element <harnessSize> for shrink sleeves

**Markup example:**

The following markup example shows the use of the element <harnessSize> and its child elements to provide harness size information for a shrink sleeve.

```
<harnessSize>
<minHarnessSize unitOfMeasure="mm">0,8</minHarnessSize>
<maxHarnessSize unitOfMeasure="mm">1,2</maxHarnessSize>
</harnessSize>
```

### 2.8.1 Minimum harness size

**Description:** The element <minHarnessSize> gives the minimum harness size.

**Markup element:** <minHarnessSize> (O)

**Attributes:**

– unitOfMeasure (O), the unit of measure for the minimum harness size

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the element <minHarnessSize> and its attribute unitOfMeasure

### 2.8.2 Maximum harness size

**Description:** The element <maxHarnessSize> gives the maximum harness size.

**Markup element:** <maxHarnessSize> (O)

**Attributes:**

– unitOfMeasure (O), the unit of measure for the maximum harness size

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the element <maxHarnessSize> and its attribute unitOfMeasure

## 2.9 Functional description reference

**Description:** The functional description reference element <functionalDescrRef> contains references to other parts of the electrical system publications for further information about a shrink sleeve, eg a description of how it is made (specification of the sleeve). References must be populated in accordance with Chap 3.9.5.2.1.2.

**Markup element:** <functionalDescrRef> (O)

**Attributes:**

– None

**Child elements:**

– <refs> (C), the functional description reference information. Refer to Chap 3.9.5.2.1.2

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of functional description references for shrink sleeves

## 2.10 Illustration reference

**Description:** The Illustration reference element <illustrationRef> contains references to other parts of the electrical system publications, which show illustrations of the shrink sleeve. References must be populated in accordance with Chap 3.9.5.2.1.2.

**Markup element:** <illustrationRef> (O)

**Attributes:**

– None

**Child elements:**

– <refs> (C), the illustration reference information. Refer to Chap 3.9.5.2.1.2

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of illustration references for shrink sleeves

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use and definition of applicability information**. The project or the organization must decide the use and the definition of applicability information for a shrink sleeve. In normal cases, it is not necessary to use applicability information for shrink sleeves. If used, it must be defined precisely and populated consistently in accordance with the project or the organization specific rules. Refer to Para 2.

**Use and definition of change attributes**. The project or the organization must decide the use and the definition of change attributes for shrink sleeve data. Refer to Para 2.

**Use of the element <partNumber>**. The project or the organization must define rules for the use of part numbers in this context. Refer to Para 2.1.

**Use of the element <altIdentGroup>**. The project or the organization must decide and define the use of alternative identifications. Refer to Chap 3.9.5.2.9.5 and Para 2.2.

**Use of the element <size>**. The project or the organization must decide and define the use of size information for shrink sleeves. If used, this element and its attribute unitOfMeasure must be populated consistently. Refer to Para 2.3.

**Use of the element <mass>**. The project or the organization must decide and define the use of the element <mass> and the attribute unitOfMeasure. If used, this element and its attribute must be populated consistently. Refer to Para 2.4.

**Use of the element <wireColor>**. The project or the organization must decide and define the use of color information for shrink sleeves. If used, this element must be populated consistently. Refer to Chap 3.9.5.2.9.2 and Para 2.5.

**Use of the element <sleeveDiameter>**. The project or the organization must decide the use and the definition of sleeve diameter information. Shrink sleeves are normally defined by using diameter information before and after shrinking. If used, it must be defined, which diameter is provided. The element <sleeveDiameter> and its child elements must then be populated in accordance with the defined project or organization specific rules consistently. Refer to Para 2.6.

**Use of the element <temperature>**. The project or the organization must decide the use and the definition of the child elements for the temperature information. If used, they must be populated consistently in accordance with the project or the organization specific rules. Refer to Chap 3.9.5.2.9.3 and Para 2.7.

**Use of the element <harnessSize>**. The project or the organization must decide the use and the definition of harness size information for shrink sleeves. The element <harnessSize> and its child elements, if used, must be populated in accordance with the defined project or organization specific rules consistently. Refer to Para 2.8.

**Use of the element <functionalDescrRef>**. The project or the organization must decide the use and the definition of functional description references. If used, references must be given consistently. Refer to Para 2.9.

**Use of the element <illustrationRef>**. The project or the organization must decide the use and the definition of illustration references. If used, references must be given consistently, eg all shrink sleeves have allocated a reference to a data module, which shows an illustration of the shrink sleeve. Refer to Para 2.10.

| Chap 3.9.5.3 | Data modules - Applicability |

## 1 General

The element <identSleeve> and its child elements are used to capture and represent identification sleeves, which are used for the Product, and the related standard parts information.

## 2 Element <identSleeve> and child elements

**Description:** The element <identSleeve> is contained in the list of identification sleeves element <identSleeveGroup>. The list of identification sleeves is a child element of the list of the standard parts element <standardPartGroup>.

It contains information concerning the properties of identification sleeves used in the Product's wiring.

**Markup element:** <identSleeve> (C)

**Attributes:**

- applicRefId (O), defines the applicability of an identification sleeve by referencing the element <applic> in the referenced applicability group as described in Chap 3.9.5.3
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O) indicate change in accordance with Chap 3.9.5.2.1.1

**Child elements:**

- <partNumber> (M), the part number of the identification sleeve
- <altIdentGroup> (O), the list of alternative identifications
- <length> (O), the length of the identification sleeve
- <material> (O), the material of the identification sleeve
- <mass> (O), the mass of the identification sleeve
- <functionalDescrRef> (O), the functional description reference
- <illustrationRef> (O), the reference to illustrations

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use and definition of applicability information for identification sleeves
- Use and definition of change attributes for identification sleeves

**Markup example:**

```
<wiringData>
<standardPartGroup>
<identSleeveGroup>
<identSleeve>...</identSleeve>
<identSleeve>...</identSleeve>
</identSleeveGroup>
</standardPartGroup>
</wiringData>
```

## 2.1 Part number

**Description:** The part number element <partNumber> contains the project or the organization specific part number of an identification sleeve. This element must be populated in accordance with Chap 3.9.5.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Definition of project or organization specific rules for the use of part numbers in this context. Refer to Chap 3.9.5.2.9.5

## 2.2 Alternative identifications

**Description:** The element <altIdentGroup> contains alternative identifications of an identification sleeve, described by manufacturer part numbers and the related manufacturer. Refer to Chap 3.9.5.2.9.5.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of alternative identifications. Refer to Chap 3.9.5.2.9.5

## 2.3 Length

**Description:** The element <length> contains the length information of an identification sleeve. If used, this element must be populated in accordance with Chap 3.9.5.2.9.8.

**Note**

The attribute **wireLengthType** provides additional length information for wires. It must not be used to describe the length of identification sleeves.

**Markup element:** <length> (O)

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <length> and its attribute unitOfMeasure. Refer to Chap 3.9.5.2.9.8

## 2.4 Material

**Description:** The element <material> describes the material, of which an identification sleeve is made. If used, this element must be populated in accordance with Chap 3.9.5.2.9.8.

**Markup element:** <material> (O)

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <material>. Refer to Chap 3.9.5.2.9.8

**Markup example:**

The following example shows the use of element <material> for an identification sleeve.

```
<material>PVC-Nitrile</material>
```

## 2.5 Mass

**Description:** The element <mass> contains the mass information of an identification sleeve. If used, this element must be populated in accordance with Chap 3.9.5.2.9.5.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <mass> and its attribute unitOfMeasure

**Markup example:**

```
<mass unitOfMeasure="kg">0,0001</mass>
```

## 2.6 Functional description reference

**Description:** The functional description reference element <functionalDescrRef> contains references to other parts of the electrical system publications for further information about an identification sleeve, eg a description of how it is made (specification of the sleeve). References must be populated in accordance with Chap 3.9.5.2.1.2.

**Markup element:** <functionalDescrRef> (O)

**Attributes:**

– None

**Child elements:**

– <refs> (C), the functional description reference information. Refer to Chap 3.9.5.2.1.2

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of functional description references for identification sleeves

## 2.7 Illustration reference

**Description:** The Illustration reference element <illustrationRef> contains references to other parts of the electrical system publications, which show illustrations of the identification sleeve. References must be populated in accordance with Chap 3.9.5.2.1.2.

**Markup element:** <illustrationRef> (O)

**Attributes:**

– None

**Child elements:**

– <refs> (C), the illustration reference information. Refer to Chap 3.9.5.2.1.2

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of illustration references for identification sleeves

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use and definition of applicability information**. The project or the organization must decide the use and the definition of applicability information for an identification sleeve. In normal cases, it is not necessary to use applicability information for identification sleeves. If used, it must be defined precisely and populated consistently in accordance with the project or the organization specific rules. Refer to Para 2.

**Use and definition of change attributes**. The project or the organization must decide the use and the definition of change attributes for identification sleeve data. Refer to Para 2.

**Use of the element <partNumber>**. The project or the organization must define rules for the use of part numbers in this context. Refer to Para 2.1.

**Use of the element <altIdentGroup>**. The project or the organization must decide and define the use of alternative identifications. Refer to Chap 3.9.5.2.9.5 and Para 2.2.

**Use of the element <length>**. The project or the organization must decide and define the use of the length element <length> and the attribute unitOfMeasure. If used, this element and its attribute must be populated consistently. Refer to Chap 3.9.5.2.9.8 and Para 2.3.

**Use of the element <`material`>**. The project or the organization must decide and define the use of material information for identification sleeves. If used, this element must be populated consistently. Refer to Chap 3.9.5.2.9.8 and Para 2.4.

**Use of the element <`mass`>**. The project or the organization must decide and define the use of the element <`mass`> and the attribute `unitOfMeasure`. If used, this element and its attribute must be populated consistently. Refer to Chap 3.9.5.2.9.5 and Para 2.5.

**Use of the element <`functionalDescrRef`>**. The project or the organization must decide the use and the definition of functional description references. If used, references must be given consistently. Refer to Para 2.6.

**Use of the element <`illustrationRef`>**. The project or the organization must decide the use and the definition of illustration references. If used, references must be given consistently, eg all identification sleeves have allocated a reference to a data module, which shows an illustration of the identification sleeve. Refer to Para 2.7.

## 1 General

The element <conduit> and its child elements are used to capture and represent conduits, which are used for the Product, and the related standard parts information.

# 2 Element <conduit> and child elements

**Description:** The element <conduit> is contained in the list of conduits element <conduitGroup>. The list of conduits is a child element of the list of the standard parts element <standardPartGroup>.

It contains information concerning the properties of conduits used in the Product's wiring.

**Markup element:** <conduit> (C)

**Attributes:**

- applicRefId (O), defines the applicability of a conduit by referencing the element <applic> in the referenced applicability group as described in Chap 3.9.5.3
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O) indicate change in accordance with Chap 3.9.5.2.1.1

**Child elements:**

- <partNumber> (M), the part number of the conduit
- <altIdentGroup> (O), the list of alternative identifications
- <size> (O), the size of the conduit
- <mass> (O), the mass of the conduit
- <wireColor> (O), the color information
- <wallThickness> (O), the wall thickness of the conduit
- <temperature> (O), the temperature information
- <functionalDescrRef> (O), the functional description reference
- <illustrationRef> (O), the reference to illustrations

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use and definition of applicability information for conduits
- Use and definition of change attributes for conduits

**Markup example:**

```
<wiringData>
<standardPartGroup>
<conduitGroup>
<conduit>...</conduit>
<conduit>...</conduit>
</conduitGroup>
</standardPartGroup>
</wiringData>
```

## 2.1 Part number

**Description:** The part number element <partNumber> contains the project or the organization specific part number of a conduit. This element must be populated in accordance with Chap 3.9.5.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Definition of project or organization specific rules for the use of part numbers in this context. Refer to Chap 3.9.5.2.9.5

## 2.2 Alternative identifications

**Description:** The element <altIdentGroup> contains alternative identifications of a conduit, described by manufacturer part numbers and the related manufacturer. Refer to Chap 3.9.5.2.9.5.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of alternative identifications. Refer to Chap 3.9.5.2.9.5

## 2.3 Size

**Description:** The element <size> contains the size information of a conduit. If used, this element must be populated in accordance with Chap 3.9.5.2.9.9.

**Markup element:** <size> (O)

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <size> and its attribute unitOfMeasure

**Markup example:**

The following markup example shows the use of element <size> for a conduit, using only the outer diameter.

```
<size unitOfMeasure="mm">11,4</size>
```

## 2.4 Mass

**Description:** The element <mass> contains the mass information of a conduit. If used, this element must be populated in accordance with Chap 3.9.5.2.9.5.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <mass> and its attribute unitOfMeasure

**Markup example:**

```
<mass unitOfMeasure="g/m">4,67</mass>
```

## 2.5 Color information

**Description:** The element <wireColor> contains the color information of a conduit. If used, it must be populated in accordance with Chap 3.9.5.2.9.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <wireColor>

**Markup example:**

```
<wireColor>Black</wireColor>
```

## 2.6 Wall thickness

**Description:** The element <wallThickness> contains the information of the wall thickness of a conduit.

**Markup element:** <wallThickness> (O)

**Attributes:**

– unitOfMeasure (O), the unit of measure for the wall thickness

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <wallThickness> and its attribute unitOfMeasure

**Markup example:**

```
<wallThickness unitOfMeasure="mm">0,15</wallThickness>
```

## 2.7 Temperature

**Description:** The element <temperature> describes the minimum and maximum temperature, for which the conduit is approved. If used, this element must be populated in accordance with Chap 3.9.5.2.9.3.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <temperature> and its child elements

**Markup example:**

```
<temperature>
<minTemperature unitOfMeasure="degC">-55</minTemperature>
<maxTemperature unitOfMeasure="degC">200</maxTemperature>
</temperature>
```

## 2.8 Functional description reference

**Description:** The functional description reference element <functionalDescrRef> contains references to other parts of the electrical system publications for further information about a conduit, eg a description of how it is made (specification of the conduit). References must be populated in accordance with Chap 3.9.5.2.1.2.

**Markup element:** <functionalDescrRef> (O)

**Attributes:**

– None

**Child elements:**

– <refs> (C), the functional description reference information. Refer to Chap 3.9.5.2.1.2

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of functional description references for conduits

## 2.9 Illustration reference

**Description:** The Illustration reference element <illustrationRef> contains references to other parts of the electrical system publications, which show illustrations of the conduit. References must be populated in accordance with Chap 3.9.5.2.1.2.

**Markup element:** <illustrationRef> (O)

**Attributes:**

– None

**Child elements:**

– <refs> (C), the illustration reference information. Refer to Chap 3.9.5.2.1.2

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of illustration references for conduits

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use and definition of applicability information**. The project or the organization must decide the use and the definition of applicability information for a conduit. In normal cases, it is not necessary to use applicability information for conduits. If used, it must be defined precisely and populated consistently in accordance with the project or the organization specific rules. Refer to Para 2.

**Use and definition of change attributes**. The project or the organization must decide the use and the definition of change attributes for conduit data. Refer to Para 2.

**Use of the element <partNumber>**. The project or the organization must define rules for the use of part numbers in this context. Refer to Para 2.1.

**Use of the element <altIdentGroup>**. The project or the organization must decide and define the use of alternative identifications. Refer to Chap 3.9.5.2.9.5 and Para 2.2.

**Use of the element <size>**. The project or the organization must decide and define the use of size information for conduits. Normally, the inside diameter and the outer diameter is available for a conduit. It is also possible, that the size is identified by a size code. Then the attribute unitOfMeasure must not be used. If the element <size> is used, then it must be populated consistently including its attribute unitOfMeasure. Refer to Para 2.3.

**Use of the element <mass>**. The project or the organization must decide and define the use of the element <mass> and the attribute unitOfMeasure. If used, this element and its attribute must be populated consistently. Refer to Chap 3.9.5.2.9.5 and Para 2.4.

**Use of the element <wireColor>**. The project or the organization must decide and define the use of color information for conduits. If used, this element must be populated consistently. Refer to Chap 3.9.5.2.9.2 and Para 2.5.

**Use of the element <wallThickness>**. The project or the organization must decide and define the use of the element <wallThickness> and the attribute unitOfMeasure. If used, this element and its attribute must be populated consistently. Refer to Para 2.6.

**Use of the element <temperature>**. The project or the organization must decide the use and the definition of the child elements for the temperature information. If used, they must be

populated consistently in accordance with the project or the organization specific rules. Refer to Chap 3.9.5.2.9.3 and Para 2.7.

**Use of the element <`functionalDescrRef`>**. The project or the organization must decide the use and the definition of functional description references. If used, references must be given consistently. Refer to Para 2.8.

**Use of the element <`illustrationRef`>**. The project or the organization must decide the use and the definition of illustration references. If used, references must be given consistently, eg all conduits have allocated a reference to a data module, which shows an illustration of the conduit. Refer to Para 2.9.

# 1 General

The element <wireMaterial> and its child elements are used to capture and represent wire material, which is used for the Product, and the related standard parts information.

# 2 Element <wireMaterial> and child elements

**Description:** The element <wireMaterial> is contained in the list of wire material element <wireMaterialGroup>. The list of wire material is a child element of the list of standard parts element <standardPartGroup>.

It contains information concerning the properties of wire material used in the Product's wiring.

**Markup element:** <wireMaterial> (C)

**Attributes:**

- applicRefId (O), defines the applicability of the wire material by referencing the element <applic> in the referenced applicability group as described in Chap 3.9.5.3
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O) indicate change in accordance with Chap 3.9.5.2.1.1

**Child elements:**

- <partNumber> (M), the part number of the wire material
- <altIdentGroup> (O), the list of alternative identifications
- <wireCode> (O), the wire code
- <numberOfCores> (O), the number of cores
- <size> (O), the size of the wire material
- <mass> (O), the mass of the wire material
- <wireColor> (O), the color information
- <outerJacketColor> (O), the outer jacket color
- <outerDiameter> (O), the outer diameter
- <resistance> (O), the resistance information
- <voltage> (O), the voltage information
- <amperage> (O), the amperage information
- <temperature> (O), the temperature information
- <screenCount> (O), the number of screens
- <coaxialCableFlag> (O), the coaxial information
- <triaxialCableFlag> (O), the tri-axial information
- <frequencyCharacteristics> (O), the frequency characteristics
- <functionalDescrRef> (O), the functional description reference
- <illustrationRef> (O), the reference to illustrations

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of applicability information for wire material
– Use and definition of change attributes for wire material

**Markup example:**

```
<wiringData>
<standardPartGroup>
<wireMaterialGroup>
<wireMaterial>...</wireMaterial>
<wireMaterial>...</wireMaterial>
</wireMaterialGroup>
</standardPartGroup>
</wiringData>
```

## 2.1 Part number

**Description:** The part number element <partNumber> contains the project or the organization specific part number of the wire material. This element must be populated in accordance with Chap 3.9.5.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Definition of project or organization specific rules for the use of part numbers in this context. Refer to Chap 3.9.5.2.9.5

## 2.2 Alternative identifications

**Description:** The element <altIdentGroup> contains alternative identifications of the wire material, described by manufacturer part numbers and the related manufacturer. Refer to Chap 3.9.5.2.9.5.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of alternative identifications. Refer to Chap 3.9.5.2.9.5

## 2.3 Wire code

**Description:** The wire code element <wireCode> gives information about the type of a wire and its gauge through its child elements. If used, this element must be populated in accordance with Chap 3.9.5.2.9.2.

For one type of wire material more than one wire gauge can be available. In this case, the wires normally get different part numbers, so that for all wire sizes a different wire material element <wireMaterial> is used. It is also possible to use the wire gauge element <wireGauge> multiple times to show the gauge of a wire in different units of measure.

**Markup element:** <wireCode> (O)

**Attributes:**

– None

**Child elements:**

– <wireType> (C), the wire type. Refer to Chap 3.9.5.2.9.2

– <wireGauge> (O), the wire gauge. Refer to Chap 3.9.5.2.9.2

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the wire code element <wireCode> and its child element <wireGauge>

**Markup example:**

The following markup example shows the use of element <wireCode> for wire material, which gives the wire gauge in metric units.

```
<wireCode>
<wireType>QC</wireType>
<wireGauge wireGaugeType="mt">1,82</wireGauge>
</wireCode>
```

## 2.4 Core

**Description:** The element <numberOfCores> contains the number of cores of the wire material.

**Markup element:** <numberOfCores> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the number of cores element <numberOfCores>

**Markup example:**

The following markup example shows the use of element <numberOfCores> for wire material with three cores.

```
<numberOfCores>3</numberOfCores>
```

## 2.5 Size

**Description:** The element <size> contains the size information of wire material. If used, this element must be populated in accordance with Chap 3.9.5.2.9.9.

The size of the wire material is often part of the part number of the wire material. It can also be given by the element <wireGauge>. In this case, the element <size> must no be used.

**Markup element:** <size> (O)

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <size> and its attribute unitOfMeasure

**Markup example:**

The following markup example shows the use of the element <size> for wire material, providing size information in coded form (as it is part of the part number of the wire material, eg JN1008QC030):

```
<size>030</size>
```

## 2.6 Mass

**Description:** The element <mass> contains the mass information of wire material. If used, this element must be populated in accordance with Chap 3.9.5.2.9.5.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <mass> and its attribute unitOfMeasure

**Markup example:**

```
<mass unitOfMeasure="kg/km">58,7</mass>
```

## 2.7 Color information

**Description:** The element <wireColor> contains the color information of wire material. If used, this element must be populated in accordance with Chap 3.9.5.2.9.2.

Due to the fact that it is only for single use, the color of the cores of multi core cables must be given in a single element <wireColor>.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <wireColor>

**Markup example:**

The following example shows the use of the element <wireColor> to provide color information (red, blue, yellow) of the cores of a three-core wire material.

```
<wireColor>R,B,Y</wireColor>
```

## 2.8 Outer jacket color

**Description:** The element <outerJacketColor> contains the color information of the outer jacket of wire material.

**Markup element:** <outerJacketColor> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the outer jacket color information for wire material

**Markup example:**

The following markup example shows the use of the element <outerJacketColor> for wire material with a white outer jacket.

```
<outerJacketColor>W</outerJacketColor>
```

## 2.9 Outer diameter

**Description:** The element <outerDiameter> contains the outer diameter information of wire material.

**Markup element:** <outerDiameter> (O)

**Attributes:**

– unitOfMeasure (O), the unit of measure for the wire material outer diameter

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <outerDiameter> and its attribute unitOfMeasure

**Markup example:**

The following markup example shows the use of the element <outerDiameter> to provide outer diameter information for wire material in mm.

```
<outerDiameter unitOfMeasure="mm">4,85</outerDiameter>
```

## 2.10 Resistance

**Description:** The element <resistance> contains the direct current (DC) resistance information of wire material.

**Markup element:** <resistance> (O)

**Attributes:**

– unitOfMeasure (O), the unit of measure for the disassembly code resistance

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <resistance> and its attribute unitOfMeasure

**Markup example:**

The following markup example shows the use of the element <resistance> for wire material in mΩ per m.

```
<resistance unitOfMeasure="mohm/m">6,8</resistance>
```

## 2.11 Voltage

**Description:** The element <voltage> contains the voltage information of wire material.

**Markup element:** <voltage> (O)

**Attributes:**

– unitOfMeasure (O), the unit of measure for the voltage

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <voltage> and its attribute unitOfMeasure

**Markup example:**

The following markup example shows the use of the element <voltage> to provide voltage information for wire material in Volts.

```
<voltage unitOfMeasure="V">600</voltage>
```

## 2.12 Amperage

**Description:** The element <amperage> contains the amperage information of the wire material.

**Markup element:** <amperage> (O)

**Attributes:**

– unitOfMeasure (O), the unit of measure for the amperage

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <amperage> and its attribute unitOfMeasure

**Markup example:**

The following markup example shows the use of the element <amperage> for wire material in Ampere.

```
<amperage unitOfMeasure="A">10</amperage>
```

## 2.13 Temperature

**Description:** The element <temperature> describes the minimum and maximum temperature, for which the wire material is approved. In many cases, only the maximum working temperature of wire material is available. If used, this element must be populated in accordance with Chap 3.9.5.2.9.3.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <temperature> and its child elements

**Markup example:**

The following markup example shows the use of the element <temperature> by providing the maximum working temperature of the wire material.

```
<temperature>
<maxTemperature unitOfMeasure="degC">260</maxTemperature>
</temperature>
```

## 2.14 Screen count

**Description:** The element <screenCount> contains the number of screens of the wire material.

**Markup element:** <screenCount> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of screen count information for wire material

**Markup example:**

The following markup example shows the use of the element <screenCount> for wire material with one screen, eg a coaxial cable.

```
<screenCount>1</screenCount>
```

## 2.15 Coaxial information

**Description:** The element <coaxialCableFlag> indicates coaxial wire material. If used, this element must be populated in accordance with Chap 3.9.5.2.9.5.

**Markup element:** <coaxialCableFlag> (O)

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <coaxialCableFlag>

**Markup example:**

The following markup example shows the use of the element <coaxialCableFlag> for coaxial wire material.

```
<coaxialCableFlag>Y</coaxialCableFlag>
```

The following markup example shows the use of the element <coaxialCableFlag> for non-coaxial wire material.

```
<coaxialCableFlag>N</coaxialCableFlag>
```

## 2.16 Tri-axial information

**Description:** The element <triaxialCableFlag> indicates tri-axial wire material. If used, this element must be populated in accordance with Chap 3.9.5.2.9.5.

**Markup element:** <triaxialCableFlag> (O)

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <triaxialCableFlag>

**Markup example:**

The following markup example shows the use of the element <triaxialCableFlag> for tri-axial wire material.

```
<triaxialCableFlag>Y</triaxialCableFlag>
```

## 2.17 Frequency characteristics

**Description:** The element <frequencyCharacteristics> contains alternating current (AC) frequency characteristics of wire material.

**Markup element:** <frequencyCharacteristics> (O)

**Attributes:**

– None

**Child elements:**

– <impedance> (C), the impedance information
– <frequencyAttenuation> (O), the frequency and attenuation information

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use frequency characteristics for wire material

**Markup example:**

The following markup example shows the use of the element <frequencyCharacteristics> for wire material. The impedance of the wire material is 50 Ω, the frequency and the attenuation are provided as given in Table 2.

*Table 2 Frequency characteristics*

| Frequency | Attenuation |
|---|---|
| 20MHz | 14dB/100m |
| 100MHz | 31dB/100m |

```
<frequencyCharacteristics>
<impedance unitOfMeasure="ohm">50</impedance>
<frequencyAttenuation>
<frequency unitOfMeasure="MHz">20</frequency>
<attenuation unitOfMeasure="dB/100m">14</attenuation>
</frequencyAttenuation>
<frequencyAttenuation>
```

```
<frequency unitOfMeasure="MHz">100</frequency>
<attenuation unitOfMeasure="dB/100m">31</attenuation>
</frequencyAttenuation>
</frequencyCharacteristics>
```

### 2.17.1 Impedance

**Description:** The element <impedance> contains the AC impedance of the wire material, normally of a cable.

**Markup element:** <impedance> (C)

**Attributes:**

– unitOfMeasure (O), the unit of measure for the impedance

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the attribute unitOfMeasure

### 2.17.2 Frequency and attenuation

**Description:** The element <frequencyAttenuation> is a repeatable container for frequency and attenuation information of wire material.

**Markup element:** <frequencyAttenuation> (O)

**Attributes:**

– None

**Child elements:**

– <frequency> (C), the frequency information
– <attenuation> (C), the attenuation information

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the element <frequencyAttenuation>

#### 2.17.2.1 Frequency

**Description:** The element <frequency> contains the frequency of wire material in relation to the attenuation.

**Markup element:** <frequency> (C)

**Attributes:**

– unitOfMeasure (O), the unit of measure for the frequency

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the attribute `unitOfMeasure`

2.17.2.2 Attenuation

**Description:** The element <`attenuation`> contains the attenuation information of wire material.

**Markup element:** <`attenuation`> (C)

**Attributes:**

– `unitOfMeasure` (O), the unit of measure for the attenuation

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the attribute `unitOfMeasure`

## 2.18 Functional description reference

**Description:** The functional description reference element <`functionalDescrRef`> contains references to other parts of the electrical system publications for further information about wire material, eg a description of how it is made (specification of the wire material). References must be populated in accordance with Chap 3.9.5.2.1.2.

**Markup element:** <`functionalDescrRef`> (O)

**Attributes:**

– None

**Child elements:**

– <`refs`> (C), the functional description reference information. Refer to Chap 3.9.5.2.1.2

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of functional description references for wire material

## 2.19 Illustration reference

**Description:** The Illustration reference element <`illustrationRef`> contains references to other parts of the electrical system publications, which show illustrations of the wire material. References must be populated in accordance with Chap 3.9.5.2.1.2.

**Markup element:** <`illustrationRef`> (O)

**Attributes:**

– None

**Child elements:**

– <`refs`> (C), the illustration reference information. Refer to Chap 3.9.5.2.1.2

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of illustration references for wire material

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use and definition of applicability information**. The project or the organization must decide the use and the definition of applicability information for wire material. In normal cases, it is not necessary to use applicability information for wire material. If used, it must be defined precisely and populated consistently in accordance with the project or the organization specific rules. Refer to Para 2.

**Use and definition of change attributes**. The project or the organization must decide the use and the definition of change attributes for wire material data. Refer to Para 2.

**Use of the element <partNumber>**. The project or the organization must define rules for the use of part numbers in this context. Refer to Para 2.1.

**Use of the element <altIdentGroup>**. The project or the organization must decide and define the use of alternative identifications. Refer to Chap 3.9.5.2.9.5 and Para 2.2.

**Use of the element <wireCode>**. The project or the organization must decide and define the use of the element <wireCode>, its child elements and the related attribute wireGaugeType. For one type of wire material more than one wire gauge can be available. In this case, the wires normally get different part numbers, so that for all wire sizes a wire material element <wireMaterial> is used. If not, the project or the organization must decide whether to divide the wire material in several wire material elements or to use the wire gauge element <wireGauge> several times in one wire material element <wireMaterial>. It is also possible to use the wire gauge element <wireGauge> multiple times to show the gauge of the wire in different units of measurement. If used, the elements and attributes must be populated consistently. Refer to Para 2.3.

**Use of the element <numberOfCores>**. The project or the organization must decide the use of the number of cores information for wire material. Refer to Para 2.4.

**Use of the element <size>**. The project or the organization must decide and define the use of size information for wire material. The size of wire material is often part of the part number of the wire material. The project or the organization can decide to provide the size information of the wire material in the element <wireGauge>. In this case, the element <size> must not be used. If the element <size> is used, then it must be populated consistently including its attribute unitOfMeasure. Refer to Para 2.5.

**Use of the element <mass>**. The project or the organization must decide and define the use of the element <mass> and the attribute unitOfMeasure. If used, this element and its attribute must be populated consistently. Refer to Chap 3.9.5.2.9.5 and Para 2.6.

**Use of the element <wireColor>**. The project or the organization must decide and define the use of color information for wire material. If used, project or organization specific rules must be defined to populate this element consistently. Refer to Chap 3.9.5.2.9.2 and Para 2.7.

**Use of the element <outerjacketColor>**. The project or the organization must decide and define the use of outer jacket color information for wire material. If used, this element and its attribute must be populated consistently. Refer to Para 2.8.

**Use of the element <outerDiameter>**. The project or the organization must decide and define the use of the outer diameter element <outerDiameter> and the attribute

unitOfMeasure. If used, this element and its attribute must be populated consistently. Refer to Para 2.9.

**Use of the element <resistance>**. The project or the organization must decide and define the use of resistance information for wire material. If used, this element and its attribute unitOfMeasure must be populated consistently. Refer to Para 2.10.

**Use of the element <voltage>**. The project or the organization must decide and define the use of voltage information for wire material. If used, this element and its attribute unitOfMeasure must be populated consistently. Refer to Para 2.11.

**Use of the element <amperage>**. The project or the organization must decide and define the use of amperage information for wire material. If used, this element and its attribute unitOfMeasure must be populated consistently. Refer to Para 2.12.

**Use of the element <temperature>**. The project or the organization must decide the use and the definition of the child elements for the temperature information. If used, they must be populated consistently in accordance with the project or the organization specific rules. Refer to Chap 3.9.5.2.9.3 and Para 2.13.

**Use of the element <screenCount>**. The project or the organization must decide and define the use of the screen count element <screenCount>. If used, this element must be populated consistently. Refer to Para 2.14.

**Use of the element <coaxialCableFlag>**. The project or the organization must decide and define the use of coaxial information for wire material. The project or the organization must decide whether to use the element <coaxialCableFlag> for all wire material or only for coaxial wire material. If used, this element must be populated consistently. Refer to Para 2.15.

**Use of the element <triaxialCableFlag>**. The project or the organization must decide and define the use of tri-axial information for wire material. The project or the organization must decide whether to use the element <triaxialCableFlag> for all wire material or only for tri-axial wire material. If used, this element must be populated consistently. Refer to Para 2.16.

**Use of the element <frequencyCharacteristics>**. The project or the organization must decide the use of frequency characteristics for wire material. If used, this element and its child elements and their attributes must be defined and used consistently. Refer to Para 2.17.

**Use of the element <functionalDescrRef>**. The project or the organization must decide the use and the definition of functional description references. If used, references must be given consistently. Refer to Para 2.18.

**Use of the element <illustrationRef>**. The project or the organization must decide the use and the definition of illustration references. If used, references must be given consistently, eg, if applicable, diagrams of cable characteristics are referenced. Refer to Para 2.19.

| Chap 3.9.5.2.1.2 | Common constructs - Referencing |

# 1 General

The wiring data description Schema is used for configuration and declaration of the elements of the wiring data Schema. It is recommended to declare elements of the wiring data Schema, which describe the components used in the Product's wiring, in the wiring data description data module(s) of the project. Elements of the wiring data Schema, which are not used, must not be defined in the wiring data description data module(s) prepared for the project.

It is possible to prepare more than one wiring data description data module. The different data modules can then contain the definitions of the used elements in different languages. It is also possible to generate different wiring data description data modules for different presentation

purposes, which means, the elements provided for maintenance personnel can differ from the elements for final assembly personnel. For data exchange purposes, the wiring data description data module(s) can be used to define the wiring data/elements, which will be exchanged.

The wiring data description can be used in an interactive wiring publication for headlines, brief descriptions or for configuration and controlling the interactive wiring publication according to the specific naming conventions of a project or an organization.

Common elements and attributes must be populated in accordance with Chap 3.9.5.2.1. Recommended wiring specific restrictions are detailed in this chapter.

# 2 Wiring data description Schema basic rules

**Description:** The wiring data description Schema defines the major element <wiringFields>, which contains the child elements for wire data/fields description, harness data/fields description, equipment data/fields description and standard parts data/fields description.

**Markup element:** <wiringFields> (M)

**Attributes:**

– None

**Child elements:**

– <descrWire> (O), the wire data/fields description
– <descrHarness> (O), the harness data/fields description
– <descrElectricalEquip> (O), the electrical equipment data/fields description
– <descrStandardPartGroup> (O), the standard parts data/fields description

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– None identified

**Markup example:**

```
<wiringFields>
<descrWire>...</descrWire>
<descrHarness>...</descrHarness>
<descrElectricalEquip>...</descrElectricalEquip>
<descrStandardPartGroup>...</descrStandardPartGroup>
</wiringFields>
```

## 2.1 Common constructs

**Description:** The description and declaration information for wiring data elements is given by a block of three elements. These are the data/field name, the data/field description and reference information.

### 2.1.1 Data/field name

**Description:** The data/field name element <fieldName> contains the name of the data field, ie the project or the organization specific naming of electrical data.

**Markup element:** <fieldName> (C) or (M), depending on the parent element occurrence

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Definition of the data/field name

**Markup example:**

The following markup example shows the use of the element <fieldName> as a child element of <descrPartNumber>.

```
<fieldName>Part number</fieldName>
```

Further examples for the use of <fieldName> are given below in this chapter.

### 2.1.2 Data/field description

**Description:** The data/field description element <descr> contains the description of the data field, ie the project or the organization specific description of electrical data. This element can in addition contain declarations of the described data.

**Markup element:** <descr> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the data/field description element <descr>

**Markup example:**

The following markup example shows the use of the element <descr> as a child element of <descrPartNumber>. It is shown in the context of the list of solder sleeves element <solderSleeveGroup>.

```
<descr>Part number provides the project or the organization
specific part number of the solder sleeve. Manufacturer part
numbers are available in the section 'Alternative
identifications'.</descr>
```

Further examples for the use of <descr> are given below in this chapter.

### 2.1.3 Data/field references

**Description:** The data/field references element <refs> contains references to other parts of the electrical system publications, which give additional information. If used, references must be populated in accordance with Chap 3.9.5.2.1.2.

**Markup element:** <refs> (O)

**Attributes:**

– None

**Child elements:**

– <dmRef> (C), the reference to a data module
– <pmRef> (C), the reference to a publication module
– <externalPubRef> (O), the reference to an external publication

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the data/field references element <refs>

## 2.2 Wire data/field descriptions

**Description:** The element <descrWire> contains all relevant elements to describe the wire data elements of the project.

**Markup element:** <descrWire> (O)

**Attributes:**

– None

**Child elements:**

– <descrCircuitIdent> (O), the circuit code description
– <descrWireNumber> (C), the wire number description
– <descrSectionIdent> (O), the section identification description
– <descrWireType> (O), the wire type description
– <descrWireGauge> (O), the wire gauge description
– <descrPartNumber> (O), the part number description
– <descrHarnessIdent> (O), the harness identification description
– <descrWireSeqNumber> (O), the wire sequential number description
– <descrWireInfoCircuitIdent> (O), the wire information circuit code description
– <descrWireInfoSectionIdent> (O), the wire information section identification description
– <descrEmcCode> (O), the electromagnetic compatibility (EMC) code description
– <descrLength> (O), the length description
– <descrWireColor> (O), the color description
– <descrTwist> (O), the twist description
– <descrCoaxialCableFlag> (O), the coaxial information description
– <descrTriaxialCableFlag> (O), the tri-axial information description
– <descrSignalInfo> (O), the signal description
– <descrReferenceDesignator> (O), the reference designator description
– <descrContact> (O), the contact description
– <descrWireConnectionCode> (O), the wire connection code description
– <descrNetworkAnalysisCode> (O), the network analysis code description
– <descrGroupCode> (O), the group code description
– <descrScreen> (O), the screen information description
– <descrPreparationInfo> (O), the preparation information description
– <descrFinishingInfo> (O), the finishing information description

- <descrResponsiblePartnerCompany> (O), the responsible partner company information description
- <descrRouting> (O), the routing description
- <descrFeedThru> (O), the feed-through information description
- <descrWireRoute> (O), the wire route lane code description
- <descrRestriction> (O), the wire restrictions description
- <descrNextHigherAssy> (O), the next higher assembly information description
- <descrFunctionalDescrRef> (O), the functional description reference description
- <descrIllustrationRef> (O), the illustration reference description

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use and definition of the element <descrWire> and its child elements

**Markup example:**

```
<descrWire><descrWireNumber>...</descrWireNumber></descrWire>
```

### 2.2.1 Circuit code description

**Description:** The element <descrCircuitIdent> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the circuit code element <circuitIdent> under element <wireIdent>. Refer to Para 2.1.

**Markup element:** <descrCircuitIdent> (O)

**Attributes:**

- None

**Child elements:**

- Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use and definition of the element <descrCircuitIdent> and its child elements

**Markup example:**

```
<descrCircuitIdent>
<fieldName>Circuit Code</fieldName>
<descr>Aircraft electrical systems are identified by a primary
alphabetic letter, eg A = Armament. A circuit within a system is
identified by the primary alphabetic letter (system
identification) and a secondary letter (sub system
identification). Both letters together make the circuit code, eg
AG = Gun System.</descr>
<refs>

<dmRefIdent>
<dmCode modelIdentCode="1B" systemDiffCode="B" systemCode="91"
subSystemCode="0" sub-subsystemCode="0" assyCode="12"
disassyCode="03" disassyCodeVariant="A" infoCode="018"
infoCodeVariant="A" itemLocationCode="A"/>
```

```
</dmRefIdent>
</dmRef>
</refs>
</descrCircuitIdent>
```

### 2.2.2 Wire number description

**Description:** The element <descrWireNumber> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the wire number element <wireNumber>. Refer to Para 2.1.

**Markup element:** <descrWireNumber> (C)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrWireNumber> and its child elements

### 2.2.3 Section identification description

**Description:** The element <descrSectionIdent> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the section identification element <sectionIdent> under element <wireIdent>. Refer to Para 2.1.

**Markup element:** <descrSectionIdent> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrSectionIdent> and its child elements

### 2.2.4 Wire type description

**Description:** The element <descrWireType> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the wire type element <wireType>. Refer to Para 2.1.

**Markup element:** <descrWireType> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrWireType> and its child elements

### 2.2.5 Wire gauge description

**Description:** The element <descrWireGauge> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the wire gauge element <wireGauge>. Refer to Para 2.1.

**Markup element:** <descrWireGauge> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrWireGauge> and its child elements

### 2.2.6 Part number description

**Description:** The element <descrPartNumber> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the part number element <partNumber>. Refer to Para 2.1.

**Markup element:** <descrPartNumber> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrPartNumber> and its child elements

### 2.2.7 Harness identification description

**Description:** The element <descrHarnessIdent> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the harness identification element <harnessIdent>. Refer to Para 2.1.

**Markup element:** <descrHarnessIdent> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrHarnessIdent> and its child elements

**2.2.8 Wire sequential number description**

**Description:** The element <descrWireSeqNumber> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the wire sequential number element <wireSeqNumber>. Refer to Para 2.1.

**Markup element:** <descrWireSeqNumber> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrWireSeqNumber> and its child elements

**2.2.9 Wire information circuit code description**

**Description:** The element <descrWireInfoCircuitIdent> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the circuit code element <circuitIdent> under element <wireInfo>. Refer to Para 2.1.

**Markup element:** <descrWireInfoCircuitIdent> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrWireInfoCircuitIdent> and its child elements

**2.2.10 Wire information section identification description**

**Description:** The element <descrWireInfoSectionIdent> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the wire section identification element <sectionIdent> under element <wireInfo>. Refer to Para 2.1.

**Markup element:** <descrWireInfoSectionIdent> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrWireInfoSectionIdent> and its child elements

### 2.2.11 EMC code description

**Description:** The element <descrEmcCode> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the EMC code element <emcCode>. Refer to Para 2.1.

**Markup element:** <descrEmcCode> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrEmcCode> and its child elements

### 2.2.12 Length description

**Description:** The element <descrLength> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the length element <length>. Refer to Para 2.1.

**Markup element:** <descrLength> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrLength> and its child elements

### 2.2.13 Color information description

**Description:** The element <descrWireColor> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the color element <wireColor>. Refer to Para 2.1.

**Markup element:** <descrWireColor> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrWireColor> and its child elements

### 2.2.14 Twist information description

**Description:** The element <descrTwist> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the twist element <twist>. Refer to Para 2.1.

**Markup element:** <descrTwist> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrTwist> and its child elements

### 2.2.15 Coaxial information description

**Description:** The element <descrCoaxialCableFlag> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the coaxial information element <coaxialCableFlag>. Refer to Para 2.1.

**Markup element:** <descrCoaxialCableFlag> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrCoaxialCableFlag> and its child elements

### 2.2.16 Tri-axial information description

**Description:** The element <descrTriaxialCableFlag> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the tri-axial information element <triaxialCableFlag>. Refer to Para 2.1.

**Markup element:** <descrTriaxialCableFlag> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrTriaxialCableFlag> and its child elements

### 2.2.17 Signal information description

**Description:** The element <descrSignalInfo> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the signal information element <signalInfo>. Refer to Para 2.1.

**Markup element:** <descrSignalInfo> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrSignalInfo> and its child elements

### 2.2.18 Reference designator description

**Description:** The element <descrReferenceDesignator> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the reference designator element <referenceDesignator>. Refer to Para 2.1.

**Markup element:** <descrReferenceDesignator> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrReferenceDesignator> and its child elements

**2.2.19 Contact information description**

**Description:** The element <descrContact> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the contact information element <contact>. Refer to Para 2.1.

**Markup element:** <descrContact> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrContact> and its child elements

**2.2.20 Wire connection code description**

**Description:** The element <descrWireConnectionCode> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the wire connection code element <wireConnectionCode>. Refer to Para 2.1.

**Markup element:** <descrWireConnectionCode> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrWireConnectionCode> and its child elements

**2.2.21 Network analysis code description**

**Description:** The element <descrNetworkAnalysisCode> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the network analysis code element <networkAnalysisCode>. Refer to Para 2.1.

**Markup element:** <descrNetworkAnalysisCode> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrNetworkAnalysisCode> and its child elements

### 2.2.22 Group code description

**Description:** The element <descrGroupCode> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the group code element <groupCode>. Refer to Para 2.1.

**Markup element:** <descrGroupCode> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrGroupCode> and its child elements

### 2.2.23 Screen information description

**Description:** The element <descrScreen> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the screen information element <screen>. Refer to Para 2.1.

**Markup element:** <descrScreen> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrScreen> and its child elements

### 2.2.24 Preparation information description

**Description:** The element <descrPreparationInfo> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the preparation information element <preparationInfo>. Refer to Para 2.1.

**Markup element:** <descrPreparationInfo> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrPreparationInfo> and its child elements

### 2.2.25 Finishing information description

**Description:** The element <descrFinishingInfo> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the finishing information element <finishingInfo>. Refer to Para 2.1.

**Markup element:** <descrFinishingInfo> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrFinishingInfo> and its child elements

### 2.2.26 Responsible partner company information description

**Description:** The element <descrResponsiblePartnerCompany> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the responsible partner company information element <responsiblePartnerCompany>. Refer to Para 2.1.

**Markup element:** <descrResponsiblePartnerCompany> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrResponsiblePartnerCompany> and its child elements

### 2.2.27 Routing description

**Description:** The element <descrRouting> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the clipping point identification element <clippingPoint> of the routing information element <routing>. Refer to Para 2.1.

**Markup element:** <descrRouting> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrRouting> and its child elements

### 2.2.28 Feed-through information description

**Description:** The element <descrFeedThru> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the reference designator element <referenceDesignator> and the attribute holeIdent of the feed-through information element <feedThru>. Refer to Para 2.1.

**Markup element:** <descrFeedThru> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrFeedThru> and its child elements

### 2.2.29 Wire route lane code description

**Description:** The element <descrWireRoute> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the wire route lane code element <wireRoute>. Refer to Para 2.1.

**Markup element:** <descrWireRoute> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrWireRoute> and its child elements

**2.2.30 Wire restrictions information description**

**Description:** The element <descrRestriction> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the wire restrictions information element <restriction>. Refer to Para 2.1.

**Markup element:** <descrRestriction> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrRestriction> and its child elements

**2.2.31 Next higher assembly information description**

**Description:** The element <descrNextHigherAssy> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the next higher assembly information element <nextHigherAssy>. Refer to Para 2.1.

**Markup element:** <descrNextHigherAssy> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrNextHigherAssy> and its child elements

**2.2.32 Functional description reference description**

**Description:** The element <descrFunctionalDescrRef> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the functional description reference element <functionalDescrRef>. Refer to Para 2.1.

**Markup element:** <descrFunctionalDescrRef> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrFunctionalDescrRef> and its child elements

### 2.2.33 Illustration reference description

**Description:** The element <descrIllustrationRef> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the illustration reference element <illustrationRef>. Refer to Para 2.1.

**Markup element:** <descrIllustrationRef> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrIllustrationRef> and its child elements

## 2.3 Harness data/field descriptions

**Description:** The element <descrHarness> contains all relevant elements to describe the harness data elements of the project.

**Markup element:** <descrHarness> (O)

**Attributes:**

– None

**Child elements:**

– <descrHarnessIdent> (C), the harness identification description. Refer to Para 2.2.7
– <descrPartNumber> (O), the part number description. Refer to Para 2.2.6
– <descrAltPartNumber> (O), the alternative part number description
– <descrManufacturerCode> (O), the manufacturer code description
– <descrHarnessVariantIdent> (O), the harness variant identification description
– <descrHarnessVariantIssue> (O), the harness variant description
– <descrHarnessName> (O), the harness name description
– <descrEmcCode> (O), the EMC code description. Refer to Para 2.2.11
– <descrMinTemperature> (O), the minimum temperature description
– <descrMaxTemperature> (O), the maximum temperature description
– <descrHarnessEnvironment> (O), the harness environment description
– <descrSleeve> (O), the harness sleeve description
– <descrRouting> (O), the routing description. Refer to Para 2.2.27

- <descrFeedThru> (O), the feed-through information description. Refer to Para 2.2.28
- <descrResponsiblePartnerCompany> (O), the responsible partner company information description. Refer to Para 2.2.26
- <descrFunctionalDescrRef> (O), the functional description reference description. Refer to Para 2.2.32
- <descrIllustrationRef> (O), the illustration reference description. Refer to Para 2.2.33

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use and definition of the element <descrHarness> and its child elements

**Markup example:**

```
<descrHarness>
<descrHarnessIdent>
<fieldName>Loom identification</fieldName>
<descr>All looms that are installed in the aircraft are
identified by a loom identification, eg 3001VB.</descr>
<refs>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="1B" systemDiffCode="B" systemCode="92"
subSystemCode="0" sub-subsystemCode="0" assyCode="00"
disassyCode="00" disassyCodeVariant="A" infoCode="040"
infoCodeVariant="A" itemLocationCode="A"/>
</dmRefIdent>
</dmRef>
</refs>
</descrHarnessIdent>
</descrHarness>
```

### 2.3.1 Alternative part number description

**Description:** The element <descrAltPartNumber> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the part number element <partNumber> within the list of alternative identifications under the element <altIdent>. Refer to Para 2.1.

**Markup element:** <descrAltPartNumber> (O)

**Attributes:**

- None

**Child elements:**

- Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use and definition of the element <descrAltPartNumber> and its child elements

### 2.3.2 Manufacturer code description

**Description:** The element <descrManufacturerCode> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other

data modules or publications for the manufacturer code element <manufacturerCode> within the list of alternative identifications under the element <altIdent>. Refer to Para 2.1.

**Markup element:** <descrManufacturerCode> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrManufacturerCode> and its child elements

### 2.3.3 Harness variant identification description

**Description:** The element <descrHarnessVariantIdent> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the harness variant identification element <harnessVariantIdent>. Refer to Para 2.1.

**Markup element:** <descrHarnessVariantIdent> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrHarnessVariantIdent> and its child elements

### 2.3.4 Harness variant issue description

**Description:** The element <descrHarnessVariantIssue> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the harness variant issue element <harnessVariantIssue>. Refer to Para 2.1.

**Markup element:** <descrHarnessVariantIssue> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrHarnessVariantIssue> and its child elements

### 2.3.5 Harness name description

**Description:** The element <descrHarnessName> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the harness name element <harnessName>. Refer to Para 2.1.

**Markup element:** <descrHarnessName> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrHarnessName> and its child elements

### 2.3.6 Minimum temperature description

**Description:** The element <descrMinTemperature> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the minimum temperature element <minTemperature>. Refer to Para 2.1.

**Markup element:** <descrMinTemperature> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrMinTemperature> and its child elements

### 2.3.7 Maximum temperature description

**Description:** The element <descrMaxTemperature> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the maximum temperature element <maxTemperature>. Refer to Para 2.1.

**Markup element:** <descrMaxTemperature> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrMaxTemperature> and its child elements

### 2.3.8 Harness environment description

**Description:** The element <descrHarnessEnvironment> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the harness environment element <harnessEnvironment>. Refer to Para 2.1.

**Markup element:** <descrHarnessEnvironment> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrHarnessEnvironment> and its child elements

### 2.3.9 Harness sleeve description

**Description:** The element <descrSleeve> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the part number element <partNumber> and the attribute sleeveMaterial of the harness sleeve element <sleeve>. Refer to Para 2.1.

**Markup element:** <descrSleeve> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrSleeve> and its child elements

## 2.4 Equipment data/field descriptions

**Description:** The element <descrElectricalEquip> contains all relevant elements to describe the equipment data elements of the project.

**Markup element:** <descrElectricalEquip> (O)

**Attributes:**

– None

**Child elements:**

- <descrReferenceDesignator> (C), the reference designator description. Refer to Para 2.2.18
- <descrPartNumber> (O), the part number description. Refer to Para 2.2.6
- <descrAltPartNumber> (O), the alternative part number description. Refer to Para 2.3.1
- <descrManufacturerCode> (O), the manufacturer code description. Refer to Para 2.3.2
- <descrInstallationLocation> (O), the installation location information description
- <descrAccessDoorOrPanel> (O), the access door or panel information description
- <descrAssy> (O), the assembly information description
- <descrNextHigherAssy> (O), the next higher assembly information description. Refer to Para 2.2.31
- <descrPositionOnNextHigherAssy> (O), the position on next higher assembly description
- <descrMaxMountingPositions> (O), the maximum number of mounting positions description
- <descrSystemBreakdownCode> (O), the system breakdown code description
- <descrSiblingPlugIdent> (O), the sibling plug identification description
- <descrTransverseLink> (O), the transverse link information description
- <descrConnectionListClass> (O), the connection list class description
- <descrElectricalContact> (O), the electrical connection contact description
- <descrElectricalStateDescr> (O), the electrical state information description
- <descrResponsiblePartnerCompany> (O), the responsible partner company information description. Refer to Para 2.2.26
- <descrEquipName> (O), the equipment name description
- <descrReqQuantity> (O), the quantity information description
- <descrEquipDescrRef> (O), the equipment description reference description
- <descrFunctionalDescrRef> (O), the functional description reference description. Refer to Para 2.2.32
- <descrIllustrationRef> (O), the illustration reference description. Refer to Para 2.2.33

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use and definition of the element <descrElectricalEquip> and its child elements

**Markup example:**

```
<descrElectricalEquip>
<descrReferenceDesignator>
<fieldName>Reference designator</fieldName>
<descr>Each item of equipment within a system / circuit is
identified by its circuit code with a sequential number before
it, eg 1AG. If items of equipment are used by more than one
system, they are identified by the use of a systems letter V.
The systems letter V will have an equipment sequential number
before it. The second letter after the V identifies the type of
equipment used and is identified within the system V. Connectors
are identified by an additional letter. The letter will come
```

```
after the equipment ident, eg 1AGA.</descr>

### 2.4.1 Installation location information description

**Description:** The element <descrInstallationLocation> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the installation location information element <installationLocation> under element <installationInfo>. Refer to Para 2.1.

**Markup element:** <descrInstallationLocation> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrInstallationLocation> and its child elements

### 2.4.2 Access door or panel information description

**Description:** The element <descrAccessDoorOrPanel> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the access door or panel element <accessDoorOrPanel> under element <installationInfo>. Refer to Para 2.1.

**Markup element:** <descrAccessDoorOrPanel> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrAccessDoorOrPanel> and its child elements

### 2.4.3 Assembly information description

**Description:** The element <descrAssy> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the assembly information element <assy> under the assembly instructions element <assyInstruction>. Refer to Para 2.1.

**Markup element:** <descrAssy> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrAssy> and its child elements

### 2.4.4 Position on next higher assembly description

**Description:** The element <descrPositionOnNextHigherAssy> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the position on next higher assembly element <positionOnNextHigherAssy> under element <installationInfo>. Refer to Para 2.1.

**Markup element:** <descrPositionOnNextHigherAssy> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrPositionOnNextHigherAssy> and its child elements

### 2.4.5 Maximum number of mounting positions description

**Description:** The element <descrMaxMountingPositions> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the maximum number of mounting positions element <maxMountingPositions>. Refer to Para 2.1.

**Markup element:** <descrMaxMountingPositions> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrMaxMountingPositions> and its child elements

### 2.4.6 System breakdown code description

**Description:** The element <descrSystemBreakdownCode> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for system break down code element <systemBreakdownCode>. Refer to Para 2.1.

**Markup element:** <descrSystemBreakdownCode> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrSystemBreakdownCode> and its child elements

### 2.4.7 Sibling plug identification description

**Description:** The element <descrSiblingPlugIdent> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the reference designator element <referenceDesignator> under the sibling plug identification element <siblingPlugIdent>. Refer to Para 2.1.

**Markup element:** <descrSiblingPlugIdent> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrSiblingPlugIdent> and its child elements

### 2.4.8 Transverse link information description

**Description:** The element <descrTransverseLink> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the contact identification element <contact> under the electrical equipment connection element <electricalEquipConnection> of the transverse link element <transverseLink>. Refer to Para 2.1.

**Markup element:** <descrTransverseLink> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrTransverseLink> and its child elements

### 2.4.9 Connection list class description

**Description:** The element <descrConnectionListClass> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the connection list class element <connectionListClass>. Refer to Para 2.1.

**Markup element:** <descrConnectionListClass> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrConnectionListClass> and its child elements

### 2.4.10 Electrical connection contact description

**Description:** The element <descrElectricalContact> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the electrical connection contact element <contact> under the electrical equipment connection element <electricalEquipConnection>. Refer to Para 2.1.

**Markup element:** <descrElectricalContact> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrElectricalContact> and its child elements

### 2.4.11 Electrical state information description

**Description:** The element <descrElectricalStateDescr> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the electrical state description element <electricalStateDescr> under the electrical equipment state information element <electricalEquipState>. Refer to Para 2.1.

**Markup element:** <descrElectricalStateDescr> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrElectricalStateDescr> and its child elements

### 2.4.12 Electrical equipment name description

**Description:** The element <descrEquipName> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the electrical equipment name element <equipName>. Refer to Para 2.1.

**Markup element:** <descrEquipName> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrEquipName> and its child elements

### 2.4.13 Quantity description

**Description:** The element <descrReqQuantity> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the required quantity information element <reqQuantity>. Refer to Para 2.1.

**Markup element:** <descrReqQuantity> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrReqQuantity> and its child elements

### 2.4.14 Equipment description reference description

**Description:** The element <descrEquipDescrRef> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the equipment description reference element <equipDescrRef>. Refer to Para 2.1.

**Markup element:** <descrEquipDescrRef> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrEquipDescrRef> and its child elements

## 2.5 Standard parts data/field descriptions

**Description:** The element <descrStandardPartGroup> contains child elements, which describe the electrical standard parts data elements.

**Markup element:** <descrStandardPartGroup> (O)

**Attributes:**

– None

**Child elements:**

– <descrConnector> (O), the connector data/field descriptions
– <descrDistributionPart> (O), the distribution part data/field descriptions
– <descrAccessory> (O), the accessory data/field descriptions
– <descrSolderSleeve> (O), the solder sleeve data/field descriptions
– <descrShrinkSleeve> (O), the shrink sleeve data/field descriptions
– <descrIdentSleeve> (O), the identification sleeve data/field descriptions
– <descrConduit> (O), the conduit data/field descriptions
– <descrWireMaterial> (O), the wire material data/field descriptions

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrStandardPartGroup> and its child elements

### 2.5.1 Connector data/field descriptions

**Description:** The element <descrConnector> contains all relevant elements to describe the connector data elements of the project.

**Markup element:** <descrConnector> (O)

**Attributes:**

- None

**Child elements:**

- <descrPartNumber> (C), the part number description. Refer to Para 2.2.6
- <descrAltPartNumber> (O), the alternative part number description. Refer to Para 2.3.1
- <descrManufacturerCode> (O), the manufacturer code description. Refer to Para 2.3.2
- <descrMass> (O), the mass information description
- <descrOrientation> (O), the orientation information description
- <descrAssy> (O), the assembly information description. Refer to Para 2.4.3
- <descrRack> (O), the rack information description
- <descrContactCount> (O), the contact count description
- <descrContact> (O), the contact information description. Refer to Para 2.2.19
- <descrContactDiameter> (O), the contact diameter description
- <descrFinishingInfo> (O), the finishing information description. Refer to Para 2.2.25
- <descrThermoCouplePlus> (O), the thermo couple plus information description
- <descrThermoCoupleMinus> (O), the thermo couple minus information description
- <descrSpecialTerminal> (O), the special terminal information description
- <descrCoaxialCableFlag> (O), the coaxial information description. Refer to Para 2.2.15
- <descrTriaxialCableFlag> (O), tri-axial information description. Refer to Para 2.2.16
- <descrTerminationModuleGroupingValue> (O), the termination module grouping information description
- <descrBlockGroupingValue> (O), the block grouping information description
- <descrShuntGroupingValue> (O), the shunt grouping information description
- <descrElectricalContact> (O), the electrical connections contact description. Refer to Para 2.4.10
- <descrElectricalStateDescr> (O), the electrical state information description. Refer to Para 2.4.11
- <descrAccessoryPartNumber> (O), the accessory information description
- <descrFunctionalDescrRef> (O), the functional description reference description. Refer to Para 2.2.32
- <descrIllustrationRef> (O), the illustration reference description. Refer to Para 2.2.33

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use and definition of the element <descrConnector> and its child elements

**Markup example:**

The following markup example shows the definition of the elements <partNumber> and <manufacturerCode> of the alternate identification of connector data. No references are applicable.

```
<descrAltPartNumber>
<fieldName>Manufacturer part number</fieldName>
<descr>Manufacturer part number provides manufacturer part
numbers, which show cross reference part numbers to the standard
part number of the connector.</descr>
</descrAltPartNumber>
<descrManufacturerCode>
<fieldName>Manufacturer</fieldName>
<descr>Manufacturer shows the manufacturer of the connector,
described by manufacturer part number.</descr>
</descrManufacturerCode>
```

2.5.1.1 Mass information description

**Description:** The element <descrMass> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the mass information element <mass>. Refer to Para 2.1.

**Markup element:** <descrMass> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrMass> and its child elements

2.5.1.2 Orientation information description

**Description:** The element <descrOrientation> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the orientation information element <orientation>. Refer to Para 2.1.

**Markup element:** <descrOrientation> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrOrientation> and its child elements

2.5.1.3 Rack information description

**Description:** The element <descrRack> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the rack information element <rack>. Refer to Para 2.1.

**Markup element:** <descrRack> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrRack> and its child elements

2.5.1.4 Contact count description

**Description:** The element <descrContactCount> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the contact count element <contactCount>. Refer to Para 2.1.

**Markup element:** <descrContactCount> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrContactCount> and its child elements

2.5.1.5 Contact diameter description

**Description:** The element <descrContactDiameter> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the contact diameter element <contactDiameter>. Refer to Para 2.1.

**Markup element:** <descrContactDiameter> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrContactDiameter> and its child elements

2.5.1.6 Thermo couple plus information description

**Description:** The element <descrThermoCouplePlus> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other

data modules or publications for the thermo couple plus information element <thermoCouplePlus>. Refer to Para 2.1.

**Markup element:** <descrThermoCouplePlus> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrThermoCouplePlus> and its child elements

2.5.1.7 Thermo couple minus information description

**Description:** The element <descrThermoCoupleMinus> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the thermo couple minus information element <thermoCoupleMinus>. Refer to Para 2.1.

**Markup element:** <descrThermoCoupleMinus> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrThermoCoupleMinus> and its child elements

2.5.1.8 Special terminal information description

**Description:** The element <descrSpecialTerminal> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the special terminal information element <specialTerminal>. Refer to Para 2.1.

**Markup element:** <descrSpecialTerminal> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrSpecialTerminal> and its child elements

2.5.1.9 Termination module grouping information description

**Description:** The element <descrTerminationModuleGroupingValue> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the termination module grouping information element <terminationModuleGroupingValue> under the contact description element <contactDescr>. Refer to Para 2.1.

**Markup element:** <descrTerminationModuleGroupingValue> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrTerminationModuleGroupingValue> and its child elements

2.5.1.10 Block grouping information description

**Description:** The element <descrBlockGroupingValue> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the block grouping information element <blockGroupingValue> under the contact description element <contactDescr>. Refer to Para 2.1.

**Markup element:** <descrBlockGroupingValue> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrBlockGroupingValue> and its child elements

2.5.1.11 Shunt grouping information description

**Description:** The element <descrShuntGroupingValue> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the shunt grouping information element <shuntGroupingValue> under the contact description element <contactDescr>. Refer to Para 2.1.

**Markup element:** <descrShuntGroupingValue> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrShuntGroupingValue> and its child elements

2.5.1.12 Accessory part number description

**Description:** The element <descrAccessoryPartNumber> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the accessory part number element <partNumber> under the list of accessories element <connectorAccessories>. Refer to Para 2.1.

**Markup element:** <descrAccessoryPartNumber> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrAccessoryPartNumber> and its child elements

**2.5.2 Distribution part data/field descriptions**

**Description:** The element <descrDistributionPart> contains all relevant elements to describe the distribution part data elements of the project.

**Markup element:** <descrDistributionPart> (O)

**Attributes:**

– None

**Child elements:**

– <descrPartNumber> (C), the part number description. Refer to Para 2.2.6
– <descrAltPartNumber> (O), the alternative part number description. Refer to Para 2.3.1
– <descrManufacturerCode> (O), the manufacturer code description. Refer to Para 2.3.2
– <descrContactSize> (O), the contact size description
– <descrMaterial> (O), the material information description
– <descrMass> (O), the mass information description. Refer to Para 2.5.1.1
– <descrOrientation> (O), the orientation information description. Refer to Para 2.5.1.2

- <descrWireColor> (O), the color information description. Refer to Para 2.2.13
- <descrSurfaceProtection> (O), the surface protection information description
- <descrContactDiameter> (O), the contact diameter description. Refer to Para 2.5.1.5
- <descrMinTemperature> (O), the minimum temperature description. Refer to Para 2.3.6
- <descrMaxTemperature> (O), the maximum temperature description. Refer to Para 2.3.7
- <descrFunctionalDescrRef> (O), the functional description reference description. Refer to Para 2.2.32
- <descrIllustrationRef> (O), the illustration reference description. Refer to Para 2.2.33

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use and definition of the element <descrDistributionPart> and its child elements

**Markup example:**

The following markup example shows the definition of the element <wireColor> of distribution part data. No references are applicable.

```
<descrWireColor>
<fieldName>Color codes</fieldName>
<descr>Color codes provides, if applicable, the colors of the
color bands of contacts, that identify the size of the
contact.</descr>
</descrWireColor>
```

2.5.2.1 Contact size description

**Description:** The element <descrContactSize> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the contact size element <contactSize>. Refer to Para 2.1.

**Markup element:** <descrContactSize> (O)

**Attributes:**

- None

**Child elements:**

- Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use and definition of the element <descrContactSize> and its child elements

2.5.2.2 Material information description

**Description:** The element <descrMaterial> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the material information element <material>. Refer to Para 2.1.

**Markup element:** <descrMaterial> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrMaterial> and its child elements

2.5.2.3 Surface protection information description

**Description:** The element <descrSurfaceProtection> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the surface protection information element <surfaceProtection>. Refer to Para 2.1.

**Markup element:** <descrSurfaceProtection> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrSurfaceProtection> and its child elements

**2.5.3 Accessory data/field descriptions**

**Description:** The element <descrAccessory> contains all relevant elements to describe the accessory data elements of the project.

**Markup element:** <descrAccessory> (O)

**Attributes:**

– None

**Child elements:**

– <descrPartNumber> (C), the part number description. Refer to Para 2.2.6
– <descrAltPartNumber> (O), the alternative part number description. Refer to Para 2.3.1
– <descrManufacturerCode> (O), the manufacturer code description. Refer to Para 2.3.2
– descrMass> (O), the mass information description. Refer to Para 2.5.1.1
– <descrOrientation> (O), the orientation information description. Refer to Para 2.5.1.2
– <descrAssy> (O), the assembly information description. Refer to Para 2.4.3
– <descrFunctionalDescrRef> (O), the functional description reference description. Refer to Para 2.2.32

– <descrIllustrationRef> (O), the illustration reference description. Refer to Para 2.2.33

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrAccessory> and its child elements

**Markup example:**

The following markup example shows the definition of the element <orientation> of accessory data. No references are applicable.

```
<descrOrientation>
<fieldName>Cable clamp orientation</fieldName>
<descr>Cable clamp orientation provides information of the
angular position of the cable clamp in degrees.</descr>
</descrOrientation>
```

### 2.5.4 Solder sleeve data/field descriptions

**Description:** The element <descrSolderSleeve> contains all relevant elements to describe the solder sleeve data elements of the project.

**Markup element:** <descrSolderSleeve> (O)

**Attributes:**

– None

**Child elements:**

– <descrPartNumber> (C), the part number description. Refer to Para 2.2.6
– <descrAltPartNumber> (O), the alternative part number description. Refer to Para 2.3.1
– <descrManufacturerCode> (O), the manufacturer code description. Refer to Para 2.3.2
– <descrLength> (O), the length description. Refer to Para 2.2.12
– <descrMaterial> (O), the material information description. Refer to Para 2.5.2.2
– <descrMass> (O), the mass information description. Refer to Para 2.5.1.1
– <descrMinDiameter> (O), the minimum diameter description
– <descrMaxDiameter> (O), the maximum diameter description
– <descrFunctionalDescrRef> (O), the functional description reference description. Refer to Para 2.2.32
– <descrIllustrationRef> (O), the illustration reference description. Refer to Para 2.2.33

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrSolderSleeve> and its child elements

**Markup example:**

The following markup example shows the definition of the elements <minDiameter> and <maxDiameter> of solder sleeve data.

```
<descrMinDiameter>
<fieldName>Entry diameter 'd' min</fieldName>
```

```
<descr>The entry diameter 'd' min describes the minimum diameter
of the stripped wires in the center of the solder
sleeve.</descr>
<refs>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="1B" systemDiffCode="B" systemCode="91"
subSystemCode="0" sub-subsystemCode="0" assyCode="33"
disassyCode="08" disassyCodeVariant="A" infoCode="040"
infoCodeVariant="A" itemLocationCode="A"/>
</dmRefIdent>
</dmRef>
</refs>
</descrMinDiameter>
<descrMaxDiameter>
<fieldName>Entry diameter 'D' max</fieldName>
<descr>The entry diameter 'D' max describes the maximum diameter
of the unstripped wires at the edge of the solder
sleeve.</descr>
<refs>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="1B" systemDiffCode="B" systemCode="91"
subSystemCode="0" sub-subsystemCode="0" assyCode="33"
disassyCode="08" disassyCodeVariant="A" infoCode="040"
infoCodeVariant="A" itemLocationCode="A"/>
</dmRefIdent>
</dmRef>
</refs>
</descrMaxDiameter>
```

2.5.4.1 Minimum diameter description

**Description:** The element <descrMinDiameter> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the minimum diameter element <minDiameter> under the sleeve diameter element <sleeveDiameter>. Refer to Para 2.1.

**Markup element:** <descrMinDiameter> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrMinDiameter> and its child elements

2.5.4.2 Maximum diameter description

**Description:** The element <descrMaxDiameter> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the maximum diameter element <maxDiameter> under the sleeve diameter element <sleeveDiameter>. Refer to Para 2.1.

**Markup element:** <descrMaxDiameter> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrMaxDiameter> and its child elements

### 2.5.5 Shrink sleeve data/field descriptions

**Description:** The element <descrShrinkSleeve> contains all relevant elements to describe the shrink sleeve data elements of the project.

**Markup element:** <descrShrinkSleeve> (O)

**Attributes:**

– None

**Child elements:**

– <descrPartNumber> (C), the part number description. Refer to Para 2.2.6
– <descrAltPartNumber> (O), the alternative part number description. Refer to Para 2.3.1
– <descrManufacturerCode> (O), the manufacturer code description. Refer to Para 2.3.2
– <descrSize> (O), the size information description
– <descrMass> (O), the mass information description. Refer to Para 2.5.1.1
– <descrWireColor> (O), the color information description. Refer to Para 2.2.13
– <descrMinDiameter> (O), the minimum diameter description. Refer to Para 2.5.4.1
– <descrMaxDiameter> (O), the minimum diameter description. Refer to Para 2.5.4.2
– <descrMinTemperature> (O), the minimum temperature description. Refer to Para 2.3.6
– <descrMaxTemperature> (O), the maximum temperature description. Refer to Para 2.3.7
– <descrMinHarnessSize> (O), the minimum harness size description
– <descrMaxHarnessSize> (O), the maximum harness size description
– <descrFunctionalDescrRef> (O), the functional description reference description. Refer to Para 2.2.32
– <descrIllustrationRef> (O), the illustration reference description. Refer to Para 2.2.33

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrShrinkSleeve> and its child elements

**Markup example:**

The following example shows the definition of the elements <minTemperature> and <maxTemperature> of shrink sleeve data. No references are applicable.

```
<descrMinTemperature>
<fieldName>Minimum ambient temperature</fieldName>
<descr>The minimum ambient temperature indicates the minimum
temperature, where application of the shrink sleeve is
recommended.</descr>
</descrMinTemperature>
<descrMaxTemperature>
<fieldName>Maximum ambient temperature</fieldName>
<descr>The maximum ambient temperature indicates the maximum
temperature, where application of the shrink sleeve is
recommended.</descr>
</descrMaxTemperature>
```

2.5.5.1 Size information description

**Description:** The element <descrSize> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the size information element <size>. Refer to Para 2.1.

**Markup element:** <descrSize> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrSize> and its child elements

2.5.5.2 Minimum harness size description

**Description:** The element <descrMinHarnessSize> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the minimum harness size element <minHarnessSize> under the harness size element <harnessSize>. Refer to Para 2.1.

**Markup element:** <descrMinHarnessSize> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrMinHarnessSize> and its child elements

2.5.5.3 Maximum harness size description

**Description:** The element <descrMaxHarnessSize> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other

data modules or publications for the maximum harness size element <maxHarnessSize> under the harness size element <harnessSize>. Refer to Para 2.1.

**Markup element:** <descrMaxHarnessSize> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrMaxHarnessSize> and its child elements

### 2.5.6 Identification sleeve data/field descriptions

**Description:** The element <descrIdentSleeve> contains all relevant elements to describe the identification sleeve data elements of the project.

**Markup element:** <descrIdentSleeve> (O)

**Attributes:**

– None

**Child elements:**

– <descrPartNumber> (C), the part number description. Refer to Para 2.2.6
– <descrAltPartNumber> (O), the alternative part number description. Refer to Para 2.3.1
– <descrManufacturerCode> (O), the manufacturer code description. Refer to Para 2.3.2
– <descrLength> (O), the length description. Refer to Para 2.2.12
– <descrMaterial> (O), the material information description. Refer to Para 2.5.2.2
– <descrMass> (O), the mass information description. Refer to Para 2.5.1.1
– <descrFunctionalDescrRef> (O), the functional description reference description. Refer to Para 2.2.32
– <descrIllustrationRef> (O), the illustration reference description. Refer to Para 2.2.33

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrIdentSleeve> and its child elements

**Markup example:**

The following markup example shows the definition of the element <length> of identification sleeve data. No references are applicable.

```
<descrLength>
<fieldName>Sleeve length</fieldName>
<descr>Sleeve length provides information on the length of the
identification sleeve.</descr>
</descrLength>
```

### 2.5.7 Conduit data/field descriptions

**Description:** The element <descrConduit> contains all relevant elements to describe the conduit data elements of the project.

**Markup element:** <descrConduit> (O)

**Attributes:**

– None

**Child elements:**

– <descrPartNumber> (C), the part number description. Refer to Para 2.2.6
– <descrAltPartNumber> (O), the alternative part number description. Refer to Para 2.3.1
– <descrManufacturerCode> (O), the manufacturer code description. Refer to Para 2.3.2
– <descrSize> (O), the size information description. Refer to Para 2.5.5.1
– <descrMass> (O), the mass information description. Refer to Para 2.5.1.1
– <descrWireColor> (O), the color information description. Refer to Para 2.2.13
– <descrWallThickness> (O), the wall thickness description
– <descrMinTemperature> (O), the minimum temperature description. Refer to Para 2.3.6
– <descrMaxTemperature> (O), the maximum temperature description. Refer to Para 2.3.7
– <descrFunctionalDescrRef> (O), the functional description reference description. Refer to Para 2.2.32
– <descrIllustrationRef> (O), the illustration reference description. Refer to Para 2.2.33

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrConduit> and its child elements

**Markup example:**

The following markup example shows the definition of the element <wallThickness> of conduit data. No references are applicable.

```
<descrWallThickness>
<fieldName>Wall thickness</fieldName>
<descr>Wall thickness provides the wall thickness information of
the conduit in millimeter.</descr>
</descrWallThickness>
```

#### 2.5.7.1 Wall thickness description

**Description:** The element <descrWallThickness> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the wall thickness element <wallThickness>. Refer to Para 2.1.

**Markup element:** <descrWallThickness> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrWallThickness> and its child elements

### 2.5.8 Wire material data/field descriptions

**Description:** The element <descrWireMaterial> contains all relevant elements to describe the conduit data elements of the project.

**Markup element:** <descrWireMaterial> (O)

**Attributes:**

– None

**Child elements:**

– <descrPartNumber> (C), the part number description. Refer to Para 2.2.6
– <descrAltPartNumber> (O), the alternat;ive part number description. Refer to Para 2.3.1
– <descrManufacturerCode> (O), the manufacturer code description. Refer to Para 2.3.2
– <descrWireType> (O), the wire type description. Refer to Para 2.2.4
– <descrWireGauge> (O), the wire gauge description. Refer to Para 2.2.5
– <descrNumberOfCores> (O), the number of cores description
– <descrSize> (O), the size information description. Refer to Para 2.5.5.1
– <descrMass> (O), the mass information description. Refer to Para 2.5.1.1
– <descrWireColor> (O), the color information description. Refer to Para 2.2.13
– <descrOuterJacketColor> (O), the outer jacket color description
– <descrOuterDiameter> (O), the outer diameter description
– <descrResistance> (O), the resistance information description
– <descrVoltage> (O), the voltage information description
– <descrAmperage> (O), the amperage information description
– <descrMinTemperature> (O), the minimum temperature description. Refer to Para 2.3.6
– <descrMaxTemperature> (O), the maximum temperature description. Refer to Para 2.3.7
– <descrScreenCount> (O), the screen count description
– <descrCoaxialCableFlag> (O), the coaxial information description. Refer to Para 2.2.15
– <descrTriaxialCableFlag> (O), tri-axial information description. Refer to Para 2.2.16
– <descrImpedance> (O), the impedance information description
– <descrFrequency> (O), the frequency information description
– <descrAttenuation> (O), the attenuation information description
– <descrFunctionalDescrRef> (O), the functional description reference description. Refer to Para 2.2.32
– <descrIllustrationRef> (O), the illustration reference description. Refer to Para 2.2.33

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrWireMaterial> and its child elements

**Markup example:**

The following markup example shows the definition of the element <wireColor> of wire material data. No references are applicable.

```
<descrWireColor>
<fieldName>Wire color</fieldName>
<descr>Wire color provides information on the color of the wire
sheathing. For multi-core cables the colors of the single wire
sheathings are shown, separated by slashes, eg
red/blue/yellow.</descr>
</descrWireColor>
```

2.5.8.1 Core description

**Description:** The element <descrNumberOfCores> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the number of cores element <numberOfCores>. Refer to Para 2.1.

**Markup element:** <descrNumberOfCores> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrNumberOfCores> and its child elements

2.5.8.2 Outer jacket color description

**Description:** The element <descrOuterJacketColor> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the outer jacket color element <outerJacketColor>. Refer to Para 2.1.

**Markup element:** <descrOuterJacketColor> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrOuterJacketColor> and its child elements

2.5.8.3 Outer diameter description

**Description:** The element <descrOuterDiameter> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the outer diameter element <outerDiameter>. Refer to Para 2.1.

**Markup element:** <descrOuterDiameter> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrOuterDiameter> and its child elements

2.5.8.4 Resistance information description

**Description:** The element <descrResistance> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the resistance information element <resistance>. Refer to Para 2.1.

**Markup element:** <descrResistance> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrResistance> and its child elements

2.5.8.5 Voltage information description

**Description:** The element <descrVoltage> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the voltage information element <voltage>. Refer to Para 2.1.

**Markup element:** <descrVoltage> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrVoltage> and its child elements

2.5.8.6 Amperage information description

**Description:** The element <descrAmperage> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the amperage information element <amperage>. Refer to Para 2.1.

**Markup element:** <descrAmperage> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrAmperage> and its child elements

2.5.8.7 Screen count description

**Description:** The element <descrScreenCount> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the screen count element <screenCount>. Refer to Para 2.1.

**Markup element:** <descrScreenCount> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrScreenCount> and its child elements

2.5.8.8 Impedance information description

**Description:** The element <descrImpedance> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the impedance information element <impedance> under the frequency characteristics element <frequencyCharacteristics>. Refer to Para 2.1.

**Markup element:** <descrImpedance> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrImpedance> and its child elements

2.5.8.9 Frequency information description

**Description:** The element <descrFrequency> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the frequency information element <frequency> under the frequency and attenuation element <frequencyAttenuation>. Refer to Para 2.1.

**Markup element:** <descrFrequency> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrFrequency> and its child elements

2.5.8.10 Attenuation information description

**Description:** The element <descrAttenuation> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the attenuation information element <attenuation> under the frequency and attenuation element <frequencyAttenuation>. Refer to Para 2.1.

**Markup element:** <descrAttenuation> (O)

**Attributes:**

– None

**Child elements:**

– Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use and definition of the element <descrAttenuation> and its child elements

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use of the element <wiringFields>**. The project or the organization must decide the use of wiring data description data modules and thus the use of the element <wiringFields>. Refer to Para 2.1.

**Use of the element <fieldName>**. The project or the organization must decide the definition of element <fieldName> for wiring data/field names. Refer to Para 2.1.1.

**Use of the element <descr>**. The project or the organization must decide the use and the definition of the wiring data/field description element <descr>. Refer to Para 2.1.2.

**Use of the element <refs>**. The project or the organization must decide the use of the element <refs> for references to detailed descriptions of the wiring data/fields including their values and meanings. If used, references must be populated in accordance with Chap 3.9.5.2.1.2 and Para 2.1.3.

**Use of the element <descrWire>**. The project or the organization must decide the use and the definition of the element <descrWire> and all its child elements to describe wire data. Refer to Para 2.2.

**Use of the element <descrHarness>**. The project or the organization must decide the use and the definition of the element <descrHarness> and all its child elements to describe harness data. Refer to Para 2.3.

**Use of the element <descrElectricalEquip>**. The project or the organization must decide the use and the definition of the element <descrElectricalEquip> and all its child elements to describe electrical equipment data. Refer to Para 2.4.

**Use of the element <descrStandardPartGroup>**. The project or the organization must decide the use and the definition of the element <descrStandardPartGroup> and all its child elements to describe electrical standard parts data. Refer to Para 2.5.

# 1 General

This chapter introduces the process data module. The process data module contains interactive processing structures to provide the capability to sequence other data modules or steps within it based on static or dynamic state information. The process data module can be of any type: procedural, fault, descriptive, etc. Its content can include preliminary and closing requirements. The process data module is useful to achieve capabilities of the Functionality Matrix in categories of (1) diagnostics (particularly dynamic diagnostics, or system simulation), (2) external processes where data is captured in the IETP and transmitted to the external process or vice versa, and (3) navigation and tracking in areas of filtering (only displaying to the user data that applies to him) and dialog-driven interaction. Refer to Chap 6.4.

Sequencing, based on state information, together with management of dynamic and static state information are required capabilities to achieve intelligent, interactive data display. This functionality is fundamental to testing and troubleshooting sequences where the next test is often based on the result of the current test (dynamic state information) or input from the Product interface (via the external application interface). It also allows the presentation of information to the user to be customized to the Product configuration or any system state.

Sequencing is accomplished by a software component called the logic engine. Refer to Para 2.4. This software component is only required for processing process data modules. Its function is basically to determine what to display next.

The process data module contains structures for traversing steps and data modules in a defined order and in if-then-else branches and loops. The process data module will also filter steps and data modules based on the value of state variables, eg [*Model* equal "B" or *Test passed* equal TRUE] which are stored in the state table. (In this chapter, variable names will appear in *italics*, expressions will be in [brackets]) If the required variable values are not in the State table, it will gather information from the user or other sources to populate the state table and then use that information to make branching and filtering decisions. When sequencing data modules, no change to the data module itself is required, and thus data modules can be reused in many sequences.

## 1.1 Interactive presentation functionality

The interactive presentation functionality is enabled thru structures provided in the process data module. The functionality is implemented in the logic engine, a software component that processes the interactive structures. Refer to Para 2.4. Detailed processing instructions are given in Chap 7.6.1.

### 1.1.1 Screen-based information grouping

The process data module is designed for interactive electronic display. Information to be displayed simultaneously on the same screen is grouped on a node. Refer to Para 2.3.1. After viewing a screen of data, the user must provide an acknowledgement to move to the next node in the procedure.

### 1.1.2 State information

The power of the process data module is in its ability to capture, store, and act upon state information – the values of defined variables such as *Model*, *Serial Number*, *Power Source*, or *Continuity Exists*. State information is normally captured via user dialogs and is stored in the state table. When the logic engine requires a variable value to determine what to display next, it searches the state table for this value.

### 1.1.3 Sequencing based on static/dynamic state information

The viewing system must support simple sequencing. This will allow the authoring of a maintenance stream such as: Open door 1, Open circuit breaker B, Functional test B, Close

circuit breaker B, Close door 1 where data items of the maintenance stream are data modules, steps, or a combination of both. The user will be automatically directed from one data item to another when he acknowledges that he has completed the instruction within the current data item. There is also a need to sequence information in a non-linear stream based on system state. For instance, the user needs to see the information within data module A if continuity existed at a designated pin, but the information within data modules B and D if it did not. In another case, the user needs to loop thru a series of rigging steps until a certain gap is less than 1,5 cm.

### 1.1.4 Context filtering based on static/dynamic state information

1.1.4.1 Definition

Context filtering of data means that the user does not select information to view, but is only presented with information that applies to his situation. This filtering is normally tied to the current configuration or state of the Product under maintenance. There is also a need to handle cases where the filtering is not configuration related, eg:

- the data only applies when the unit is deployed in the field rather than being at a maintenance facility
- the data only applies in a certain range of sensor reading values from the equipment

Context filtering is achieved by attaching conditions to pieces of data that describe under what circumstances that data applies. Hence, procedure A might have a condition attached to it making it applicable when the unit under maintenance is an "A" Model with Serial Number greater than 155678. Procedure A will only be seen under those circumstances. In the same manner, procedure B could be applicable when using battery power and procedure C could be applicable when using APU power. In this case, procedures B and C can be authored as "alternatives" of one another. They can be grouped together and when accessed for maintenance, the appropriate one used based on the type of power employed. Most process data module elements have associated "Alt" elements allowing this grouping of data items that serve the same purpose but apply under different conditions. The "Alt" element is a powerful construct that, for example, allows an author to create one procedure that handles different configurations of the Product by employing alternative steps where the configuration differences drive unique data. This concept is discussed in Para 2.3.4.2.

1.1.4.2 Business rules decisions

Business rules decisions include, but are not limited to, the following:

- level of context filtering
- model structure or expression

### 1.1.5 State table management

In order to sequence and context filter data, the system must be capable of collecting and maintaining the system state. This is achieved thru the use of state variables and expressions that use these variables. The system maintains a list of variables and their associated values. This list is called the state table. Any information that will be required to make a filtering, branching, looping decision, or that is needed to pass to an external application must be defined as a variable and stored in the state table. The system obtains values for variables thru user dialogs, external application interfaces, or authored variable assignments. The system uses these variable values to evaluate expressions. The result of an expression evaluation determines which data the user will see.

# 2 Process data module

The process data module uses sequencing and filtering constructs to provide a seamless, logical flow of information to the user. This flow is implemented by the logic engine software component. The user will move thru a sequence of data items based on how the process data module author intended. The user can be asked questions to facilitate if-then-else branching and applicability filtering. The author decides what the user sees and what choices he has. The

user acknowledges that he has completed the instruction within a data item and the logic engine determines the next data item for viewing based on state information. Primary constructs of the process data module are described below.

## 2.1 References

References must be populated in accordance with Chap 3.9.5.2.1.2.

## 2.2 Warnings and Cautions

Warnings and cautions must be authored in accordance with Chap 3.9.3.

## 2.3 Process Flow Constructs

### 2.3.1 Process

**Description:** The element <process> is the top level element containing the process flow constructs.

**Markup element:** <process> (M)

**Attributes:**

- id (O), the identifier of the <process> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <variableDeclarations> (O). Refer to Para 2.3.2.
- <commonInfo> (O). Refer to Chap 3.9.5.2.1.12.
- <preliminaryRqmts> (O). Refer to Chap 3.9.5.2.1.9 and Para 2.3.3.
- <dmSeq> (M). Refer to Para 2.3.4.
- <closeRqmts> (O). Refer to Chap 3.9.5.2.1.9 and Para 2.3.3.

**Business rules decisions:**

- None identified

Markup example**:**

```
<process>
<dmSeq>
...
</dmSeq>
</process>
```

### 2.3.2 Variable declarations

**Description:** Variable declarations define and can initialize one to many variables that are used within the process data module. All variables used in a process data module must be declared within it. As of this writing, all variables are global in scope.

**Markup element:** <variableDeclarations> (O)

**Attributes:**

- id (O), the identifier of the <variableDeclarations> element. Refer to Chap 3.9.5.2.1.2.

**Child elements:**

– <variable> (M). Refer to Para 2.3.7.

**Business rules decisions:**

– None identified

Markup example:

```
<variableDeclarations>
<variable valueType="string" variableName="name"/>
<variable valueType="string" variableName="level">
<initialize>
<expression><stringValue>amateur</stringValue></expression>
</initialize>
</variable>
</variableDeclarations>
```

### 2.3.3 Preliminary requirements and Close requirements

**Description:** Process data modules can contain preliminary requirements and close requirements as in the Procedure data module with one difference. In the Process data module, one to many optional element <variablePostSet> can be authored in conjunction with all elements within element <reqCondGroup> except element <noConds>. This feature allows the author to assert a variable value to the state table based on a required condition or closing requirement being satisfied. An example usage is to track doors opened or closed, power applied, etc. Refer to Chap 3.9.5.2.1.9. For viewer behavior, refer to Chap 7.6.1.

**Markup elements:** <preliminaryRqmts> (O), <closeRqmts> (O)

**Attributes:**

<preliminaryRqmts>

– None

<closeRqmts>

– id (O), the identifier of the <process> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Business rules decisions:**

– None identified

**Markup example:** Refer to Chap 3.9.5.2.1.9 for markup examples.

### 2.3.4 Data module sequences

**Description:** A data module sequence determines the order of steps, dialogs, external application calls, data module references, and/or conditional actions within the data module.

**Markup element:** <dmSeq> (M)

The element <dmSeq> contains a one to many choice sequence of elements defined below. The contents of the element <dmSeq> are processed in sequential order by the logic engine. The results of the processing determine whether or not the content of a particular element in the

sequence is displayed or traversed. In the examples at Para 4, all occurrences of the element <dmNode> are subject to the process data module's expanded applicability processing (refer to Para 2.3.4.1.8) which can filter them out. In addition, the element <dmIf>, and/or the element <dmLoop> structures require processing to determine what is displayed.

**Attributes:**

- id (O), the identifier of the <dmSeq> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- independentCheck (O) Refer to Chap 3.9.5.2.3.
- skillLevelCode (O) Refer to Chap 3.9.5.2.3.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <dmNode> (O), repeatable. Refer to Para 2.3.4.1.
- <dmNodeAlt> (O), repeatable. Refer to Para 2.3.4.2.
- <dmIf> (O), repeatable. Refer to. Para 2.3.4.3.
- <dmLoop> (O), repeatable. Refer to Para 2.3.4.4.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of the attribute independentCheck
- use of the attribute skillLevelCode

Markup example**:**

```
<dmSeq>
<dmNode>
<proceduralStep>
<title>Introduction</title>
<para>Because you are an inexperienced user, you will be
presented a brief introduction on how to operate a
bicycle</para>
</proceduralStep>
</dmNode>
<dmNode>
<dmRef xlink:href="DMC_S1000DBIKE_AAA_D00_00__00AA_043A_A">
<dmRefIdent>
<dmCode assyCode="00" disassyCode="00" disassyCodeVariant="00"
infoCode="43A" infoCodeVariant="A" itemLocationCode="A"
modelIdentCode="S1000DBIKE" subSubSystemCode="0"
subSystemCode="D" systemCode="AAA" systemDiffCode="ALL"/>
</dmRefIdent>
</dmRef>
</dmNode>
</dmSeq>
```

2.3.4.1 Data module node

**Description:** A data module node represents technical information that is to be displayed on one screen. This screen can be scrollable.

The content of a <dmNode> consists of either:

- a dmRef,
- a sequence of an unlimited choice of
  - figures, tables, or multimedia objects or
  - element <proceduralStep> or element <proceduralStepAlt> followed by an optional dialog or message using the element <dialog>, the element <dialogAlt>, the element <message>, or the element <messageAlt>
- an <externalApplication>
- a dialog or message
- a data module sequence - do NOT use, will be deleted in the next issue

In a process data module, technical content is "wrapped" in the element <dmNode> structure allowing applicability (refer to Para 2.3.4.1.8), variablePreSets and variablePostSets to be applied to the content.

It is important to remember, the element <dmNode> represents one screen of data.

**Markup element:** <dmNode>

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the <dmNode> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <variablePreSet> (O), repeatable. Refer to Para 2.3.4.1.9.
- <dmRef> (O). Refer to Chap 3.9.5.2.1.2.
- <figure> (O). Refer to Para 2.3.4.1.2.
- <foldout> (O). Refer to Para 2.3.4.1.2.
- <table> (O). Refer to Para 2.3.4.1.2.
- <multimedia> (O). Refer to Para 2.3.4.1.2.
- <proceduralStep> (O), repeatable. Refer to Para 2.3.4.1.3.
- <proceduralStepAlt> (O), repeatable. Refer to Para 2.3.4.1.4.
- <dialog> (O). Refer to Para 2.3.4.1.6.
- <dialogAlt> (O). Refer to Para 2.3.4.1.7.
- <message> (O). Refer to Para 2.3.5.5.
- <messageAlt> (O). Refer to Para 2.3.5.5.
- <externalApplication> (O). Refer to Para 2.3.4.1.5.
- <variablePostSet> (O), repeatable. Refer to Para 2.3.4.1.12.

**Business rules decisions:**

- None identified

**Markup example:**

```
<dmNode>
<proceduralStep>
<title>Prerequisities</title>
<para>Please make sure you are familiar with the functional
description of a bicycle.</para>
```

```
</proceduralStep>
</dmNode>
```

2.3.4.1.1 *Data module reference*

**Description:** References are implemented in accordance with Chap 3.9.5.2.1.2. When an element <dmNode> contains an element <dmRef>, the data module referenced is displayed depending upon the values of <dmRef> child element <behavior> attribute linkActuate and attribute linkShow.

**Markup element:** <behavior> (O)

**Attributes:**

- linkShow (O). This attribute can have one of the following values:
  - "newPane" will open another window for the referenced data allowing the user to view the reference alongside the current data.
  - "embedInContext" will display the linked data inline at the point where the dmRef occurred. This is useful when you have data that can be used verbatim in several data modules and maintained in a separate data module to itself.
  - "replaceAndReturnToSource" will replace the current screen of data with the dmRef data and then return the user to the origin of the dmRef when he presses Next to continue. This is normal reference handling where the user views the reference and then returns to the original procedure.
  - "replaceAndNoReturn" will replace the current screen of data with the dmRef data and not provide a Next option. "replaceAndNoReturn" conceptually breaks the connection with the referencing data. It is useful in a troubleshooting situation when the fault has been isolated, the user is referenced to a remedy, and there is no reason for him to return to the troubleshooting procedure.
- linkActuate (O). This attribute can have one of the following values:
  - "onLoad" will cause the referenced data to be automatically displayed with no action by the user – a mandatory reference so to speak.
  - "onRequest" requires the user to click or otherwise indicate he wishes to view the referenced data at this time.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

```
<dmRef>
<dmRefIdent>
<dmCode assyCode="0000" disassyCode="00"
disassyCodeVariant="000" infoCode="000" infoCodeVariant="0"
itemLocationCode="A" modelIdentCode="AA" subSubSystemCode="0"
subSystemCode="0" systemCode="01" systemDiffCode="AAA"/>
</dmRefIdent>
<behavior linkShow="replaceAndReturnToSource"
linkActuate="onRequest"/>
</dmRef>
```

2.3.4.1.2 *Figure, table, foldout or multimedia*

**Description:** Figures, tables, foldouts, or multimedia are implemented in accordance with Chap 3.9.5.2.1.7, Chap 3.9.5.2.1.6, Chap 3.9.5.2.1.7 and Chap 3.9.2.4 respectively. Figures, tables, foldouts or multimedia can be put on an element <dmNode> by themselves or with

other step information. There is also, of course, the option to put these items within the content of a procedural step if they are directly related to that step.

**Markup elements:** <figure>, <table>, <foldout>, <multimedia> (O)

*2.3.4.1.3 Procedural step*

**Description:** The element <proceduralStep> is implemented as in the procedural data module in accordance with Chap 3.9.5.2.3. An addition to the step model in the process data module is the ability to include the element <variableRef> within the element <para>. The use of the element <variableRef> will include the variable value from the process data module state table in the paragraph text. Uses of this capability might be to display to the end user a test result received from an external application or the result of a calculation performed by the logic engine needed to perform a task.

The element <proceduralStep> also provides for subordinate steps, by nesting the element <proceduralStep> and the element <proceduralStepAlt> described in Para 2.3.4.1.4. The step structure allows for sub-steps creating a hierarchical structure. This structure would be evident on the screen in an IETP. If more than one step of the same level occurs in the content, it will be evident on screen that the steps are at the same level of hierarchy. When the element <proceduralStep> is the content of a dmNode, all elements <proceduralStep> and content will be displayed as one screen of information.

Within a dmNode, after the element <proceduralStep> content, one of the following options can be inserted: element <dialog>, element <dialogAlt>, element <message>, or element <messageAlt>. This allows an author to generate a screen of data with a user question or message at the end. It must be at the end of the screen content because the OK and Cancel buttons on a dialog are used for navigation to another screen. Expected viewer behavior is that Next and Previous functions on the screen will be disabled yielding to the OK and Cancel buttons on the dialog. OK will advance to the next screen. Cancel will move back to the previous screen. For dialog content, refer to Para 2.3.4.1.6. For viewer handling of a node with steps and a dialog, refer to Chap 7.6.1.

**Note**

Authors must be careful using references with behavior replaceAndNoReturn on a node with step content and a dialog. Any user taking a replaceAndNoReturn link will never interact with the dialog following the step content.

**Markup element:** <proceduralStep>

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- warningRefs (O), the warning reference to the warnings and cautions collection. Refer to Chap 3.9.3.
- cautionRefs (O), the caution reference to the warnings and cautions collection. Refer to Chap 3.9.3.
- keepWithNext (O), the indication whether a step should be presented together with the next step, if possible. Refer to Chap 3.9.5.2.3.
- itemCharacteristic (O), used to indicate characteristics of the item that is the subject of a given procedural step. Refer to Chap 3.9.5.2.3.
- skillLevelCode (O), the skill level required for the complete procedure. Refer to Chap 3.9.5.1. This attribute can have the following values:
  - "sk01" thru "sk99". Refer to Chap 3.9.6.1.
- independentCheck (O), the complete procedure must be checked by a supervisor with a given qualification. Refer to Chap 3.9.5.2.3.

- id (O), the identifier of the <dmNode> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <title> (O). Refer to Chap 3.9.5.2.1.5 for general rules on titles.
- <warning> (O). Refer to Chap 3.9.3 for general rules on warnings.
- <caution> (O). Refer to Chap 3.9.3 for general rules on cautions.
- <note> (O). Refer to Chap 3.9.3.
- <para> (O). Refer to Chap 3.9.5.2.1.10.
- <figure> (O). Refer to Chap 3.9.5.2.1.7.
- <multimedia> (O). Refer to Chap 3.9.2.4.
- <foldout> (O). Refer to Chap 3.9.5.2.1.7.
- <table> (O). Refer to Chap 3.9.5.2.1.6.
- <caption> (O). Refer to Chap 3.9.5.2.1.4.

**Business rules decisions:**

- None identified

**Markup example:**

```
<dmNode>
<proceduralStep>
<title>Practical part</title>
<para>Take the bicycle from the garage.</para>
</proceduralStep>
<proceduralStep>
<para>Clean the bicycle from the dust.</para>
</proceduralStep>
<proceduralStep>
<para>Sit on the bike.</para>
</proceduralStep>
<proceduralStep>
<para>...and (RIDE)!</para>
</proceduralStep>
</dmNode>
```

*2.3.4.1.4 Procedural step alternate*

**Description:** The element <proceduralStepAlt> provides the capability to group in one structure several potential steps of data for display. Only one or none will be displayed depending on the applicability assigned to the element <proceduralStep> within the element <proceduralStepAlt>. Refer to Para 2.3.4.2.

**Markup element:** <proceduralStepAlt> (O)

**Attributes:**

- id (O), the identifier of the <proceduralStepAlt> element. Refer to Chap 3.9.5.2.1.2.

- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- altName (O), a name for the alt group.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

<proceduralStep> (M), repeatable. Refer to Para 2.3.4.1.3.

**Business rules decisions:**

- None identified

**Markup example:**

```
<dmNode>
<proceduralStepAlt>
<proceduralStep applicRefId="applic1">
...
</proceduralStep>
<proceduralStep applicRefId="applic2">
...
</proceduralStep>
</proceduralStepAlt>
</dmNode>
```

*2.3.4.1.5 External application*

**Description:** The element <externalApplication> is a mechanism for launching an external application in the midst of a process data module. This application might be a wiring data viewer, a calculator, a diagnostic test, etc. Refer to Para 2.3.8 for expanded coverage of this element.

**Markup element:** <externalApplication>

**Attributes:**

- id (O), the identifier of the <externalApplication> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- application (M), the entity reference to the external application.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <paraBasic> (M). Refer to Para 2.3.8.1.
- <send> (O). Refer to Para 2.3.8.2.
- <receiveValue> (O). Refer to Para 2.3.8.3.
- <receiveByPosition> (O). Refer to Para 2.3.8.5.
- <receiveByName> (O). Refer to Para 2.3.8.4.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– the method of tagging variables

**Markup example:**

```
<dmNode>
<externalApplication application="MMS">
<paraBasic>Update the Maintenance Management System
(MMS)</paraBasic>
<send>
<sendName>code</sendName>
<variableRef variableName="ECU.fault-code"/>
</send>
</externalApplication>
</dmNode>
```

*2.3.4.1.6 Dialog*

**Description:** The element <dialog> allows the logic engine to interact with the user. It provides a means to obtain variable values from the user by asking him a question. Refer to Para 2.3.5 for expanded coverage of this element.

**Markup element:** <dialog>

**Attributes:**

– applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
– id (O), the identifier of the <dialog> element. Refer to Chap 3.9.5.2.1.2.
– submitCaption (O), indicates caption used for the submit function push button. This attribute can have one of the following values:
  - "ok01" (D), sets the caption as "OK"
  - "ok02" sets the caption as "SUBMIT"
  - "ok03" sets the caption as "YES"
  - "ok04" sets the caption as "CONTINUE"
  - "ok05" sets the caption as "EXIT"
  - "ok06" thru "ok50" reserved for future S1000D use
  - "ok51" thru "ok99" sets the caption with project specific captions
– cancelCaption (O), indicates caption used for the cancel function push button
  - "ca01" (D), sets the caption as "CANCEL"
  - "ca02" sets the caption as "ABORT"
  - "ca03" sets the caption as "NO"
  - "ca04" sets the caption as "END"
  - "ca05" sets the caption as "QUIT"
  - "ca06" thru "ca50" reserved for future S1000D use
  - "ca51" thru "ca99" sets the caption with project specific captions
– resetCaption (O), indicates caption used for the optional reset function push button
  - "re01" - Sets the caption as "RESET"
  - "re02" - Sets the caption as "CLEAR"
  - "re03" thru "re50" - Reserved for future S1000D use
  - "re51" thru "re99" - Sets the caption with project specific captions.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <title> (O), dialog title bar text.
- Select at least one of the following
  - <userEntry> (O). Refer to Para 2.3.5.3.
  - <menu> (O). Refer to Para 2.3.5.2.
  - <pushButton> (O). Refer to Para 2.3.5.4.
  - <message> (O), <messageAlt> (O) Refer to Para 2.3.5.5.
  - <dialogGroup> (O). Refer to Para 2.3.5.7.
- <helpInfo> (O), provides additional information relative to the dialog.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- dialogs associated with variables.
- menu vs userEntry dialogs.
- dialog button captions.
- dialog defaults.
- dialog text consistency.

**Markup example:**

```
<dialog>
<userEntry>
<prompt>
<paraBasic>Enter your name</paraBasic>
</prompt>
<variableRef variableName="name"/>
</userEntry>
</dialog>
```

*2.3.4.1.7 Dialog alternate*

**Description:** The element <dialogAlt> groups configuration or situation unique dialogs for display to the user. Only one or none will be displayed depending on the applicability assigned to each element <dialog> within the element <dialogAlt>. Refer to Para 2.3.4.2.

**Markup element:** <dialogAlt>

**Attributes:**

- id (O), the identifier of the <dialogAlt> element. Refer to Chap 3.9.5.2.1.2.
- altName (O), a name for the alt group
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <dialog> (M), repeatable. Refer to Para 2.3.4.1.6.

**Business rules decisions:**

- None identified

**Markup example:**

Refer to element <proceduralStepAlt>, Para 2.3.4.1.4 for like and similar markup.

```
<dialogAlt>
<dialog applicRefId="applic3">
<userEntry dataEntryFieldLength="3">
<prompt>
<paraBasic>Enter your age</paraBasic>
</prompt>
<variableRef variableName="age"/></userEntry>
</dialog>
</dialogAlt>
```

*2.3.4.1.8 Applicability*

The attribute `applicRefId` references an applicability structure which determines whether or not the element it is an attribute of is displayed. Applicability is available on dmNode subelements such as element <`dmRef`>, element <`proceduralStep`>, element <`dialog`>, element <`menuChoice`> and others. The applicability element <`applic`> and attribute `applicRefId` are described at Chap 3.9.5.3.

How applicability is authored in a process data module largely depends on the logic engine employed in the viewer.

(1) If the goal is totally automated context filtering of the data and the logic engine cannot automatically filter based on standard applicability, all of the filtering conditions, configuration ([*`Model`* equal "F4J"]) and other ([*`Test Passed`* equal TRUE]), must be authored in the element <`expression`>.

(2) If the goal is automated context filtering of the data, and the logic engine will do that using the standard S1000D applicability structure, the standard structure can be authored as in any other data module type. If an expression is authored also, such as [Test Passed equal TRUE], it will be "anded" with the standard applicability structure.

*2.3.4.1.9 Variable pre set*

**Description:** The element <`variablePreSet`> assigns a value to a variable before the element <`dmNode`> is traversed. The element <`variablePreSet`> contains the element <`assertion`>. An assertion contains the element <`variableRef`> and the element <`expression`>. The element <`variableRef`> has the attribute `variableName`, which is the name of the variable to receive the expression resulting value. When a `variablePreSet` is encountered in the data, the logic engine evaluates the expression and assigns the resulting value to the variable named in the element <`variableRef`>. For example, a `variablePreSet` could be used on a `dmNode` with an external application call to assign values to one or more of the parameter variables to be passed to the application.

**Markup element:** <`variablePreSet`>

**Attributes:**

– `id` (O), the identifier of the <`variablePreSet`> element. Refer to Chap 3.9.5.2.1.2.

**Child elements:**

– <`assertion`> (M) assigns a value to a variable. Refer to Para 2.3.4.1.10.

**Business rules decisions:**

– None identified

**Markup example:**

```
<variablePreSet>
<assertion>
```

```
<variableRef variableName="tourMistakes"/>
<expression>
<integerValue>0</integerValue>
</expression>
</assertion>
</variablePreSet>
```

2.3.4.1.10 *Assertion*

**Description:** The element <assertion> assigns a value to a variable.

**Markup element:** <assertion>

**Attributes:**

– id (O), the identifier of the <assertion> element. Refer to Chap 3.9.5.2.1.2.

**Child elements:**

– <variableRef> (M). Refer to Para 2.3.4.1.11.
– <expression> (M). Refer to Para 2.3.6.

When an assertion is evaluated, the resulting value of the expression element is assigned to the variable referenced by element <variableRef>.

**Business rules decisions:**

– None identified

**Markup example:**

```
<assertion>
<variableRef variableName="level"/>
<expression>
<stringValue>experienced</stringValue>
</expression>
</assertion>
```

2.3.4.1.11 *Variable reference*

**Description**: Element <variableRef> points to a variable.

**Markup element:** <variableRef>

**Attributes:**

– variableName (M), name of variable identified by element <variableRef>

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<variableRef variableName="level"/>
```

2.3.4.1.12 *Variable post set*

**Description:** The element <variablePostSet> mirrors the element <variablePreSet>. It contains an assertion and assigns a value to a variable after the element <dmNode> has been traversed. For example, a variablePostSet could be

used on a step to apply power to assert to the state table that power has been applied for future reference by the logic engine.

**Markup element:** <variablePostSet>

**Attributes:**

– id (O), the identifier of the <variablePostSet> element. Refer to Chap 3.9.5.2.1.2.

**Child elements:**

– <assertion> (M) Refer to Para 2.3.4.1.10.

**Business rules decisions:**

– None identified

**Markup example:**

```
<variablePostSet>
<assertion>
<variableRef variableName="powerApplied"/>
<expression>
<booleanValue><trueValue/></booleanValue>
</expression>
</assertion>
</variablePostSet>
```

2.3.4.2 Alternative data module node

**Description:** An alternative (or conditional) node is a group of objects one or none of which will be applicable and thus displayed in a given situation.

The following discussion of the element <dmNodeAlt> applies to any alternative element, eg element <proceduralStepAlt>, element <dialogAlt>, element <messageAlt>, etc.

The element <dmNodeAlt> (a group of node alternatives) provides the ability to group occurrences of the element <dmNode> together which apply in different contextual situations. Only one node or none of the group will be displayed. For example, three versions of a "disconnect connector" step can exist in the element <dmNodeAlt> due to equipment configuration differences. For any configuration, only one version of the step applies. The logic engine will evaluate the applicability expression for all occurrences of the element <dmNode> within the element <dmNodeAlt>. Only the first node whose applicability expression evaluates to TRUE will be displayed. There need not be an occurrence of the element <dmNode> within the element <dmNodeAlt> that is applicable for every possible situation. In such cases, the logic engine simply moves on to the next element <dmNode>. Every node in an alternative node must have applicability. Applicability on the alternative elements are optional in the content section of the schema, however for alternative processing applicability is required on the alternative elements. Applicability on the nodes of an alternative group should be mutually exclusive.

Although the schema does not require alternative dmNodes to have mutually exclusive applicability (or the attribute applicRefId at all), it is important to understand the danger of overlapping applicability on alternative nodes. At most one will pass thru the logic engine to be displayed to the user, and if more than one applies, the user will miss something. A node with no applicability will always apply. There can be reasons to author overlapping applicability within an alternative element, but it is not recommended.

**Markup element:** <dmNodeAlt> (O)

**Attributes:**

- id (O), the identifier of the <dmNodeAlt> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- altName (O), name for alternate group
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <dmNode> (M) repeatable. Refer to Para 2.3.4.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of alternatives

**Markup example:**

```
<dmNodeAlt>
<dmNode applicRefId="wrongAnswer">
<proceduralStep>
<title>Wrong answer!</title>
<para>You will be given the introduction once again.</para>
<para>Number of mistakes: <variableRef
variableName="tourMistakes"/></para>
</proceduralStep>
</dmNode>
<dmNode applicRefId="rightAnswer">
<proceduralStep>
<title>Correct!</title>
<para>You can now continue with the practical part of this
manual.</para>
</proceduralStep>
</dmNode>
</dmNodeAlt>
```

2.3.4.3 Data module branch

**Description:** A branch sends the user down separate data paths based on state information such as configuration information or how the user has answered questions. Branches can be nested.

The element <dmIf> uses the same logic as the "if-then-else" statement in a programming language. An element <dmIf> contains an expression that the logic engine evaluates to determine whether the element <dmThenSeq> or the element <dmElseSeq> is to be traversed.

The element <dmThenSeq> defines the data module sequence (described by the element <dmSeq>) to be traversed if the element <dmIf> expression evaluates to TRUE. Element <dmThenSeq> is required.

The element <dmElseSeq> defines a data module sequence (described by the element <dmSeq>) to be traversed if the element <dmIf> expression evaluates to FALSE. Element <dmElseSeq> is optional.

**Markup element:** <dmIf> (O)

**Attributes:**

- id (O), the identifier of the <dmIf> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <expression> (M). Refer to Para 2.3.6.
- <dmThenSeq> (M). Refer to Para 2.3.4.
- <dmElseSeq> (O). Refer to Para 2.3.4.

**Business rules decisions:**

- None identified

**Markup example:**

```
<dmIf>
<expression>
<expression>
<booleanFunction booleanAction="not"/>
<expression>
<variableRef variableName="level"/>
</expression>
</expression>
<booleanOperator booleanOperation="equal"/>
<expression>
<stringValue>experienced</stringValue>
</expression>
</expression>
<dmThenSeq>
<dmNode>
<dialog>
<message>
<prompt>
<paraBasic>Inexperienced users may not access this
data.</paraBasic>
</prompt>
</message>
</dialog>
</dmNode>
</dmThenSeq>
</dmIf>
```

2.3.4.4 Data module loops

**Description:** A loop repeats a sequence of information as long as the loop condition (based on state information) is true.

The element <dmLoop> provides a capability similar to programming language loops. The element provides the syntax for creating WHILE (eg WHILE a gap measurement < 1,5) or FOR NEXT (eg FOR NEXT 5 times) loops, whichever applies to the situation. The element <dmLoop> contains an expression that is the WHILE condition for the loop and the element <dmSeq> (the content of the loop). The user will traverse the data module sequence as long as the expression evaluates to TRUE. Optionally a loop can contain a loop entrance assertion (described by the element <variablePreSet>) and a loop end assertion (described by the

element <assertion>) enabling counters to be implemented. The loop entrance assertion is made when (and only when) the user first enters the loop (eg [*Counter* = 0]). The loop end assertion (eg [*Counter* = *Counter* + 1]) is made each time the user reaches the end of the loop sequence described by the element <dmSeq>.

**Markup element:** <dmLoop>

**Attributes:**

- id (O), the identifier of the <dmLoop> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <variablePreSet> (O) Refer to Para 2.3.4.1.9.
- <expression> (M) Refer to Para 2.3.6.
- <dmSeq> (M). Refer to Para 2.3.4.
- <assertion> (O). Refer to Para 2.3.4.1.10.

**Business Rules Decisions:**

Business rules decisions include, but are not limited to, the following:

- use of loops

**Markup example:**

```
<dmLoop>
<expression>
<expression>
<variableRef variableName="tourFinished"/>
</expression>
<numberOperator numberOperation="equal"/>
<expression>
<booleanValue><falseValue/></booleanValue>
</expression>
</expression>
<dmSeq>
<dmNode>
<proceduralStep>
<title>Introduction</title>
<para>Because you are an inexperienced user, you will be
presented a brief introduction on how to operate a
bicycle.</para>
</proceduralStep>
<proceduralStep>
<para>Click <emphasis>next</emphasis>.</para>
</proceduralStep>
</dmNode>
<dmNode>
<proceduralStep>
<para>Before you can, you will be given a simple question to
test whether you read the instructions carefully.</para>
</proceduralStep>
</dmNode>
```

```
<dmNode>
<dialog>
<menu choiceSelection="single" choiceType="select">
<prompt>
<paraBasic>The rear brake is operated by</paraBasic>
</prompt>
<menuChoice>
<prompt>
<paraBasic>Left brake lever</paraBasic>
</prompt>
<assertion>
<variableRef variableName="tourCorrectAnswer"/>
<expression>
<booleanValue><falseValue/></booleanValue>
</expression>
</assertion>
</menuChoice>
<menuChoice>
<prompt>
<paraBasic>Right brake lever</paraBasic>
</prompt>
<assertion>
<variableRef variableName="tourCorrectAnswer"/>
<expression>
<booleanValue><trueValue/></booleanValue>
</expression>
</assertion>
<assertion>
<variableRef variableName="tourFinished"/>
<expression>
<booleanValue><trueValue/></booleanValue>
</expression>
</assertion>
</menuChoice>
</menu>
</dialog>
</dmNode>
</dmSeq>
</dmLoop>
```

### 2.3.5 Collection of user information

The primary method of populating the state table for use in context filtering, branching, or looping is asking the user for information thru a dialog.

#### 2.3.5.1 Definition

The element <dialog> enables the process data module to collect information from the user (eg "Has component B been installed?, "Did continuity exist?") and assign values to variables. Dialogs can be presented in four dialog types as a:

- menu, using the element <menu>
- "fill-in-the-blank", using the element <userEntry>
- push button, using the element <pushButton>
- message, using the element <message>.

Examples of all four types are in Para 4. The four dialog types can have multiple occurrences. Multiple dialog types can be grouped and arranged horizontally, using the element <dialogGroup>. When the user responds to a dialog and selects the navigation submit function, the logic engine updates the state table based on the response. Dialog elements can

contain applicability and be contained in alternative elements to allow different dialogs to be displayed depending on the Product configuration or other state variables. Dialog elements can contain enabling or disabling conditions for data entry fields dependent on user input.

A dialog is one method of assigning a value to a variable. To facilitate this, a dialog can be associated with a variable in the markup. This association is not required, but it is recommended if a dialog is the primary source of the variable's value. The logic engine will automatically display a variable's associated dialog if it needs a value for expression evaluation and none exists in the state table. If there is no associated dialog and no value for a variable in the state table, an error will be generated. Authors must ensure that all variables have values (thru `variablePreSets` or `variablePostSets`) or means to obtain values (dialogs) prior to their use in expressions.

Dialogs can be explicitly authored in the element <`dmNode`>. This is useful if there is a variable with no associated dialog and the variable value needs to be populated. Explicit dialogs can also be used to force a question to the user to update the value of a dynamic variable already in the state table. For example, if you are looping based on a temperature that will change as the user progresses thru the loop sequence (loop WHILE condition: [*`Temperature`* `greaterThan` 5000]), you need to query for the updated temperature at the end of the loop sequence with an explicit dialog and update the value so that the user can eventually exit the loop. The logic engine will not automatically display a variable's dialog when evaluating the loop WHILE condition if there is already a value in the state table.

2.3.5.2 User menus

**Description:** Menus are the most popular way of getting information from a user. The process data module dialog menu has some powerful features.

**Markup element:** <`menu`> (O)

**Attributes:**

- `applicRefId` (O), the applicability information. Refer to Chap 3.9.5.3.
- `id` (O), the identifier of the <`menu`> element. Refer to Chap 3.9.5.2.1.2.
- `choiceSelection` (O), which indicates whether single or multiple choices can be selected.
  - "`single`" (D) - Only a single choice from the list must be selected, usually presented as a radio button.
  - "`multiple`" - A single choice or several choices from the list can be selected, usually presented as a checkbox. At least one choice must be selected. All choices selected are processed.

  If the multiple choices describe the same variable, the variable should be of attribute `valueType` "`set-string`", "`set-real`" or "`set-integer`". A set variable can be multi-valued where other types of variables can not. For example, an author can inquire of the end user "Which warning tones were heard?" and provide choices: "Stall", "Engine fire", "APU Fire", "Unsafe landing". When the user selects one or more of these choices, the values would be added to set-string variable *`Warning tones`*.
- `choiceType` (M) indicates how the menu choices are displayed
  - "`select`" - The menu choices are displayed as selection (radio or checkbox)
  - "`pulldown`" - The menu choices are displayed as a scrollable list.
- `menuChoiceFlow` (O)indicates how the menu choices are displayed
  - "`list`" (D) - The menu choices are listed vertically.
  - "`inline`" - The menu choices are listed horizontally.
- `mandatory` (O), indicates if a menu choice must be selected before dialog submittal
  - "`1`" (D) - At least one menu choice must be selected.

- "0" - No menu choice must be selected.

**Child elements:**

– <enabledState> (O) an expression which indicates if the menu is active or inactive. Refer to Para 2.3.5.2.3.
– <prompt> (O) question for the user. Refer to Para 2.3.5.2.1.
– <menuChoice> (M) repeatable. Refer to Para 2.3.5.2.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– optional or mandatory entries.

**Markup example:**

```
<menu choiceSelection="single" choiceType="select">
<prompt>
<paraBasic>Did you ever ride a bicycle?</paraBasic>
</prompt>
<menuChoice>
<prompt>
<paraBasic>Yes</paraBasic>
</prompt>
<assertion>
<variableRef variableName="level"/>
<expression>
<stringValue>experienced</stringValue>
</expression>
</assertion>
</menuChoice>
<menuChoice>
<prompt>
<paraBasic>No</paraBasic>
</prompt>
<noAssertions/>
</menuChoice>
</menu>
```

2.3.5.2.1 *User prompts*

**Description:** The element <prompt> contains text that is the question or information for the user. Refer to Chap 3.9.5.2.1.10.

**Markup element:** <prompt>

**Attributes:**

– id (O), the identifier of the <prompt> element. Refer to Chap 3.9.5.2.1.2.
– textDisplayPosition (O), which indicates the text display placement in relationship to the data entry or selection. If the attribute is not used, the IETP implies the text is positioned above for a user menu question, left for a userEntry question, and right for menu choice text.
  - "top" - The prompt is positioned above the data entry information
  - "bottom" - The prompt is positioned below the data entry information
  - "right" - The prompt is positioned right of the data entry information
  - "left" - The prompt is positioned left of the data entry information.

**Child elements:**

- <paraBasic> (O). Refer to Chap 3.9.5.2.1.10.
- <emphasis> (O). Refer to Chap 3.9.5.2.1.10.
- <symbol> (O). Refer to Chap 3.9.5.2.1.10.
- <subScript> (O). Refer to Chap 3.9.5.2.1.10.
- <superScript> (O). Refer to Chap 3.9.5.2.1.10.
- <variableRef> (O) allows a variable value to be contained in the prompt text. Refer to Chap 3.9.5.2.1.10 and Para 2.3.4.1.3.

**Business rules decisions:**

- None identified

**Markup example:**

```
<prompt>
<paraBasic>Did you ever ride a bicycle?</paraBasic>
</prompt>
```

*2.3.5.2.2* *User choices*

**Description:** The element <menuChoice> represents one possible answer to the prompt question. The text of the answer is marked up by element <prompt>.

**Markup element:** <menuChoice>

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the <menuChoice> element. Refer to Chap 3.9.5.2.1.2.
- menuChoiceDefaultFlag (O), which indicates if this choice is to appear pre-selected in the dialog.
  - "1" - The choice is pre-selected.
  - "0" (D) - The choice is not pre-selected.

**Child elements:**

- <enabledState> (O). Refer to Para 2.3.5.2.3.
- <prompt> (M). Refer to Para 2.3.5.2.1.
- <externalApplication> (O). Refer to Para 2.3.4.1.5.
- <dialog> (O) Refer to Para 2.3.4.1.6.
- <pushButton> (O) repeatable. Refer to Para 2.3.5.4.
- <assertion> (O) Refer to Para 2.3.4.1.10.
- <noAssertions> (O), used when no state table variables are changed.

The element <menuChoice> must contain either one or more element <assertion> or an element <noAssertions>. If the user selects the choice and assertion(s) exist, the assertion(s) will be made to the state table after dialog submittal. If element <noAssertions> exists, the state table is not updated. The purpose of a dialog is to assign the value of a state variable so that the logic engine can use that value in a later expression evaluation. Normally element <menuChoice> will have one assertion assigning a value to a state variable.

The element <menuChoice> can contain applicability to allow menu dialogs to be customized for different Product configurations.

The element <menuChoice> can contain an enable/disable expression (element <enabledState>) indicating if the menu choice is active or inactive to allow menu dialogs to be customized.

The element <menuChoice> can contain an associated action as either an external application (the element <externalApplication>)or a secondary dialog (the element <dialog>). The associated action can be used to provide additional information (sound, image, execute diagnostic test, etc) to assist with the dialog selection. The action is executed by selecting the menu choice. Element <menuChoice> can contain a third choice - one to many push buttons (the element <pushButton>). Pushbuttons can be used to execute dialogs and external applications as well. Regardless of how the action is executed, after the action is completed, control returns to the dialog.

The element <menuChoice> has the attribute menuChoiceDefaultFlag, which indicates if this choice is to appear pre-selected in the dialog.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– optional or mandatory entries

**Markup example:**

```
<menuChoice>
<prompt>
<paraBasic>Yes</paraBasic>
</prompt>
<assertion>
<variableRef variableName="level"/>
<expression>
<stringValue>experienced</stringValue>
</expression>
</assertion>
</menuChoice>
<menuChoice>
<prompt>
<paraBasic>No</paraBasic>
</prompt>
<noAssertions/>
</menuChoice>
```

*2.3.5.2.3 User enabling/disabling entry*

**Description:** The element <enabledState> contains an expression that evaluates state variables to determine if data entry field input is permitted or inhibited (usually the data entry is visible, but dimmed or grayed out).

The element <enabledState> is evaluated when data input is entered within the dialog and before the dialog is submitted. Typically, this is used when a user selects a menu choice that requires additional data entry information, while other menu choices do not require the additional data entry.

An example is a dialog containing both a menu and a user entry dialog. The menu has two choices: integer (assertion is [*datatype* = "integer"]) and real (assertion is [*datatype* = "real"]). The user entry dialog requests a real precision value (enable expression is [*datatype* equal "real"]). If the integer choice is selected from the menu, the user entry is disabled, if the real choice is selected, the user entry is enabled.

**Markup element:** <enabledState>

**Attributes:**

– None

**Child Elements:**

– <expression> (M) Refer to Para 2.3.6.

**Business rules decisions:**

– None identified

**Markup example:**

```
<dialog submitCaption="ok01" cancelCaption="ca01">
<dialogGroup>
<title>Driving Condition</title>
<menu choiceType="select" choiceSelection="single">
<menuChoice>
<prompt><paraBasic>Day</paraBasic></prompt>
<assertion>
<variableRef variableName="condition"/>
<expression><stringValue>day</stringValue></expression>
</assertion>
</menuChoice>
<menuChoice>
<prompt><paraBasic>Night</paraBasic></prompt>
<assertion>
<variableRef variableName="condition"/>
<expression><stringValue>night</stringValue></expression>
</assertion>
</menuChoice>
</menu>
</dialogGroup>
<dialogGroup dialogSeparator="1">
<title>Bike Checklist</title>
<menu choiceType="select" choiceSelection="multiple">
<menuChoice>
<prompt><paraBasic>Wearing Helmet</paraBasic></prompt>
<assertion>
<variableRef variableName="helmet"/>
<expression>
<booleanValue><trueValue/></booleanValue>
</expression>
</assertion>
</menuChoice>
<menuChoice>
<enabledState>
<expression>
<expression><variableRef variableName="condition"/></expression>
<booleanOperator booleanOperation="equal"/>
<expression><stringValue>night</stringValue></expression>
</expression>
</enabledState>
<prompt><paraBasic>Headlight On</paraBasic></prompt>
<assertion>
<variableRef variableName="headlight"/>
<expression>
<booleanValue><trueValue/></booleanValue>
</expression>
</assertion>
```

```
</menuChoice>
<menuChoice>
<prompt><paraBasic>Correct Air Pressure in
Tire</paraBasic></prompt>
<assertion>
<variableRef variableName="air pressure"/>
<expression>
<booleanValue><trueValue/></booleanValue>
</expression>
</assertion>
</menuChoice>
<menuChoice>
<prompt><paraBasic>Mirror is Adjusted</paraBasic></prompt>
<assertion>
<variableRef variableName="mirror"/>
<expression>
<booleanValue><trueValue/></booleanValue>
</expression>
</assertion>
</menuChoice>
</menu>
</dialogGroup>
</dialog>
```

2.3.5.3 User dialog entry

**Description:** A user entry dialog receives data input by the user.

**Markup element:** <`userEntry`>

**Attributes:**

- `applicRefId` (O), the applicability information. Refer to Chap 3.9.5.3.
- `id` (O), the identifier of the <`listItem`> element. Refer to Chap 3.9.5.2.1.2.
- `mandatory` (O), indicates if an entry must be provided before dialog submittal
  - "`1`" (D) – User must provide entry.
  - "`0`" – No entry is required.
- `dataEntryFieldLength` (O), entry field length in characters.

**Child elements:**

- <`enabledState`> (O). Refer to Para 2.3.5.2.3.
- <`prompt`> (M). Refer to Para 2.3.5.2.1.
- <`variableRef`> (M). Refer to Para 2.3.4.1.11.
- <`default`> (O). Refer to Para 2.3.5.3.1.
- <`validate`> (O). Refer to Para 2.3.5.3.2.
- <`pushButton`> (O). Refer to Para 2.3.5.4.

The element <`userEntry`> contains the element <`prompt`> and the element <`variableRef`> to receive the value entered by the user.

The element <`userEntry`> can contain the element <`default`> containing a default value for the user entry.

The element <`userEntry`> can contain applicability to allow user entry dialogs to be customized for different product configurations.

The element <`userEntry`> can contain an enable/disable expression indicating if the user entry is active or inactive to allow the dialog to be customized.

The element <userEntry> can contain a data entry validation expression for both numerical and non-numerical data.

– The attribute dataEntryFieldLength indicates the user entry field length in characters. When entered data is longer than the field, the data is scrolled to allow the additional information. The default length is 20.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– optional or mandatory entries
– userEntry validates error messages

**Markup example:**

```
<userEntry>
<prompt>
<paraBasic>Enter your name</paraBasic>
</prompt>
<variableRef variableName="name"/>
</userEntry>
```

2.3.5.3.1 *Default user entry*

**Description:** The user entry can have a default value that pre-populates the user entry field with the value.

**Markup element:** <default>

**Attributes:**

– None

**Child elements:**

– <expression> (M). Refer to Para 2.3.6.

The default value is assigned by using the optional element <default> that contains the element <expression>. The evaluated expression result is the default value used in the user entry field. The expression can contain:

– A fixed value (entered as a data type (integer, real, or string))
– A state variable reference (including the user entry state variable reference)
– An expression evaluated result from state variable references and/or fixed values (*Pressure* + 20,0)

**Business rules decisions:**

– None identified

**Markup example:**

```
<userEntry>
<prompt>
<paraBasic>Enter your name</paraBasic>
</prompt>
<variableRef variableName="name"/>
<default>
<expression><stringValue>Jane Doe</stringValue>
</expression>
</default>
</userEntry>
```

*2.3.5.3.2 Validate user entry*

**Description:** The element <validate> is used for validating the user entry thru an expression evaluation (refer to Para 2.4.4) of the input information.

**The validation authenticates both numerical and non-numerical input.**

– Validating numerical user entry inputs

The numerical validation expression determines if the input value is in a specified number range. The expression uses standard numerical comparison operators (ie, equal, greaterThan, lessThanOrEqual) and connects the numerical comparisons with a Boolean connector (ie, or, and, exclusiveOr).

An example is to validate that a pressure is entered in the range from 0 to 90 p.s.i. A state variable *Pressure* is used and the validation expression is expressed as [[*Pressure* >= 0] and [*Pressure* <= 90]]. A user entry that is < 0 or > 90 would indicate an invalid value.

– Validating non-numerical (character string) user entry inputs

The non-numerical validation expression can use various expression operators to determine user entry length, included or excluded within a "set-string", or correct alpha or numerical text is entered in the correct sequence.

An example is to validate that five (5) characters are entered for a CAGE code. A state variable *CAGEC* is used and the validation expression is expressed as [sizeOf (*CAGEC*) = 5]. A user entry that is less or more than 5 characters would indicate an invalid value.

**Markup element:** <validate>

**Attributes:**

– errorMessage (O), text displayed to the user if validation fails.

**Child elements:**

– <expression> (M). Refer to Para 2.3.6.

**Business rules decisions:**

– None identified

**Markup example:**

```
<validate errorMessage="Age must be within 4 to 100">
<expression>
<expression>
<expression>
<variableRef variableName="age"/>
</expression>
<numberOperator numberOperation="greaterThanOrEqual"/>
<expression>
<integerValue>4</integerValue>
</expression>
</expression>
<booleanOperator booleanOperation="and"/>
<expression>
<expression>
<variableRef variableName="age"/>
</expression>
<numberOperator numberOperation="lessThanOrEqual"/>
<expression>
```

```
<integerValue>100</integerValue>
</expression>
</expression>
</expression>
</validate>
```

2.3.5.4 Push button

**Description:** The element <pushButton> provides a means to supply information for the data field entry(s) thru an external application (eg, diagnostic test, sound, and video) or secondary dialog (eg, advanced features).

**Markup element:** <pushButton>

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.

**Child Elements:**

- <enabledState> (O). Refer to Para 2.3.5.2.3.
- <prompt> (M). Refer to Para 2.3.5.2.1.
- <externalApplication> (O). Refer to Para 2.3.4.1.5.
- <dialog> (O). Refer to Para 2.3.4.1.6.

The element <pushButton> must contain the element <prompt> and either the element <externalApplication> or the element <dialog>. The element <prompt> provides the button caption.

The element <pushButton> can contain an enable/disable expression indicating whether the push button is active or inactive to allow the dialog to be customized.

**Business rules decisions:**

- None identified

**Markup example:**

```
<pushButton>
<prompt>
<paraBasic>View video</paraBasic>
</prompt>
<externalApplication application="videoApp">
<paraBasic>S1000D and Me</paraBasic>
</externalApplication>
</pushButton>
```

2.3.5.5 User message

**Description:** The element <message> provides information from the IETP to the user or additional instructions or details about a parent dialog.

**Markup element:** <message>

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the <message> element. Refer to Chap 3.9.5.2.1.2.
- submitCaption (O), indicates caption used for the submit function push button. This attribute can have one of the following values:
  - "ok01" (D) – sets the caption as "OK"

- "ok02" – sets the caption as "SUBMIT"
- "ok03" – sets the caption as "YES"
- "ok04" – sets the caption as "CONTINUE"
- "ok05" – sets the caption as "EXIT"
- "ok06" thru "ok50" – reserved for future S1000D use
- "ok51" thru "ok99" – sets the caption with project specific captions

**Child elements:**

– <title> (O), dialog title bar text.
– <prompt> (M) repeatable. Refer to Para 2.3.5.2.1.

The element <message> can contain applicability, the element <title> and must contain one or more of the element <prompt> to be displayed to the user.

**Business rules decisions:**

– None identified

**Markup example:**

```
<message>
<prompt>
<paraBasic>Age must be within 4 to 100</paraBasic>
</prompt>
<prompt>
<paraBasic>All fields are mandatory</paraBasic>
</prompt>
</message>
```

2.3.5.6 Alternate message

**Description:** The element <messageAlt> contains alternative messages one or none of which are applicable in a given situation and will be displayed to the user. Refer to Para 2.3.4.2.

**Markup element:** <messageAlt> (O), repeatable

**Attributes:**

– id (O), the identifier of the <messageAlt> element. Refer to Chap 3.9.5.2.1.2.
– altName (O), name for alt group
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

– <message> (C), repeatable. Refer to Para 2.3.5.5.

**Business rules decisions:**

– None identified

**Markup Example:**

```
<messageAlt>
<message>
<prompt>
<paraBasic>Age out of range</paraBasic>
</prompt>
```

```
</message>
</messageAlt>
```

2.3.5.7 Dialog layout

**Description:** The element <dialogGroup> allows the positioning of multiple dialog elements in within one dialog either vertically or horizontally.

When multiple dialog types (menu, user entry, message, push button, and message) are used in a single dialog, the author can describe simple formatting instructions to the IETP to provide a logical flow to the dialog. The following elements and attributes can affect dialog layout:

- The element <prompt> attribute position specifies the prompt position as above, bottom, left or right of the dialog component.
- The element <menu> attribute menuChoiceFlow describes the user menu choice direction as vertical or horizontal.
- The element <userEntry> attribute dataEntryFieldLength describes the data entry field width in characters.
- When using multiple dialog types, the dialog types can be grouped to change the flow direction using the element <dialogGroup>. The element <dialogGroup> arranges the dialog types contained within the element from vertical alignment to horizontal alignment. Nested dialog groups change the flow direction from either vertical alignment to horizontal alignment or horizontal alignment to vertical alignment. The elements with the element <dialog> normally have a vertical alignment (top to bottom), however the dialog type elements within the element <dialogGroup> would change the alignment to horizontal (left to right) (Refer to Fig 1). The element <dialogGroup> has the attribute dialogSeparator which indicates that the group dialog has a separator marking (ie, horizontal bar, boxed).

**Markup element**: <dialogGroup> (O) repeatable.

**Attributes:**

- id (O), the identifier of the <dialogGroup> element. Refer to Chap 3.9.5.2.1.2.
- dialogSeparator (O), provides a separator marking
  - "1" – Separator marking.
  - "0" (D) – No separator marking.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- Same as element <dialog> without element <helpInfo>. Refer to Para 2.3.4.1.6.

**Business rules decisions:**

- None identified

ICN-S1000D-A-030905-A-99994-00008-A-01-1

*Fig 1 Example single and nested dialog group alignment*

**Markup example:**

```
<dialog>
<dialogGroup>
<userEntry>
<prompt><paraBasic>Enter your name</paraBasic></prompt>
<variableRef variableName="name"/>
</userEntry>

### 2.3.6 Expressions

**Description:** Expressions are combinations of variables and operators. The logic engine evaluates expressions primarily in order to determine what is displayed to the user as in applicability ([`Model` = "T"]) and branching ([If `Error Condition` = "4"]) and loop (WHILE

[*Counter* < "5" ]) conditions. Expressions are also used to assign a value to a variable ([*Ave* = *Sum* / 3]). Refer to Chap 7.6.1 entitled "Expression evaluation" for detailed information.

The element <expression> defines something to be evaluated by the logic engine. Expressions are used to assign values to variables in assertions, eg the value of the expression [*Counter* plus 1] might be assigned to variable *Counter*. They are also used in applicability, branches, and other constructs to determine what is displayed to the user. In element <applic>, for example, if the expression [*Item deployed* equal TRUE] evaluates to TRUE, the data item containing the applicability is displayed and vice versa. Expressions are authored by combining variables (or other expressions) and values with binary or unary operators. In their simplest form, an expression can be just a variable or a value.

**Markup element:** <expression>

**Attributes:**

- id (O), the identifier of the <expression> element. Refer to Chap 3.9.5.2.1.2.
- humanReadableForm (O), textual form of the expression to be used in printing.

**Child Elements:**

- <booleanOperator> (O). Refer to Chap 7.6.1.
- <numberOperator> (O). Refer to Chap 7.6.1.
- <setOperator> (O). Refer to Chap 7.6.1.
- <stringOperator> (O). Refer to Chap 7.6.1.
- <booleanFunction> (O). Refer to Chap 7.6.1.
- <numberFunction> (O). Refer to Chap 7.6.1.
- <setFunction> (O). Refer to Chap 7.6.1.
- <stringFunction> (O). Refer to Chap 7.6.1.
- <subStringFunction> (O). Refer to Chap 7.6.1.
- <booleanValue> (O). Refer to Chap 7.6.1.
- <stringValue> (O). Refer to Chap 7.6.1.
- <realValue> (O). Refer to Chap 7.6.1.
- <integerValue> (O). Refer to Chap 7.6.1.
- <setValue> (O). Refer to Chap 7.6.1.
- <noValue> (O). Refer to Chap 7.6.1.
- <variableRef> (O). Refer to Para 2.3.4.1.11.
- <expression>

**Business rules decisions:**

- None identified

**Markup example:**

```
<expression>
<stringValue>experienced</stringValue>
</expression>

<expression>
<integerValue>0</integerValue>
</expression>

<expression>
<expression>
<variableRef variableName="tourFinished"/>
</expression>
```

```
<numberOperator numberOperation="equal"/>
<expression>
<booleanValue><falseValue/></booleanValue>
</expression>
</expression>
```

### 2.3.7 Variables

**Description**: Variables define pieces of information required by the logic engine to context filter, branch, etc within a process data module.

**Markup element**: <variable>

**Attributes:**

- variableName (M), a short name for the variable. The attribute variableName is not normally seen by the end user.
- variableDescr (O), a human readable description of the variable. Often the variable name is not descriptive enough. The description is not normally seen by the end user.
- productConfigurationFlag (O), a flag indicating if this variable describes the configuration of the Product. For example, *Model* and *Serial number* would be configuration variables. In an implementation where the IETP can extract configuration information from a configuration management system, the productConfigurationFlag flag would identify which variable values the IETP might query for.
- valueType (O)
  - "boolean" — Boolean values are TRUE or FALSE
  - "string" — String values are alphanumeric
  - "integer" (D) — Integer values are numeric and contain no decimal point
  - "real" — Real values are numeric and contain a decimal point
  - "set-string", "set-real", or "set-integer" — Set variable represents an unordered list of like values: string, real, or integer.
- valuePrecision (O), the precision of real type data.
- variableScope (O), scope of the variable
  - "global" (D) — scope is for the entire user session. "Global" is the only scope currently supported.

**Child elements:**

- <dialog> (O). Refer to Para 2.3.4.1.6.
- <dialogAlt> (O). Refer to Para 2.3.4.1.7.
- <initialize> (O). Refer to Para 2.3.7.1.

The element <variable> can have different values at different times in the same way as a programming variable. Variables and their values are stored in the state table and the values are used when evaluating expressions. In Para 2.3.6, *Counter* and *Item deployed* are variables. The element <variable> contains an optional dialog that can be used by the logic engine to obtain the value for the variable if no value has been asserted. It also contains an optional element <initialize> that is used to set an initial value for the variable using element <expression>.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- variable naming and typing

**Markup example:**

```
<variable valueType="string" variableName="name"></variable>
<variable valueType="string" variableName="level">
<initialize>
<expression><stringValue>amateur</stringValue></expression>
</initialize>
</variable>
```

2.3.7.1 Initialize

**Description**: The element <initialize> is used to set an initial value for the variable using element <expression>.

**Markup element**: <initialize>

**Attributes:**

– None

**Child elements:**

– <expression> (O). Refer to Para 2.3.6.

**Business rules decisions:**

– None identified

**Markup example:**

```
<initialize>
<expression>
<stringValue>amateur</stringValue>
</expression>
</initialize>
```

**2.3.8 External application interface**

The element <externalApplication> provides the capability to launch an external program from the IETP. Parameter data can be passed to the program and values can be received back from the program. Parameter data can be passed to the application in the form of variable values or strings. Data received from an external application must be assigned to a previously defined variable of the appropriate type. External application calls can only appear in element <dmNode>.

2.3.8.1 Element <paraBasic>

**Description:** Element <paraBasic> contains a description of the external application or other information that will be displayed to the user.

**Markup element:** <paraBasic>

**Attributes:**

– None

**Child Elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<paraBasic>Update the Maintenance Management System
(MMS)</paraBasic>
```

2.3.8.2 Element <send>

**Description:** Element <send> defines parameters to send to the called application.

**Markup element:** <send>

**Attributes:**

- id (O), the identifier of the <send> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <sendName> (O), the parameter name used by the external application.
- Choice of either.
- <variableRef> (M). Refer to Para 2.3.4.1.11.
- <stringValue> (M), the send value is a fixed value.

Element <send> contains an optional element <sendName> and element <variableRef> or element <stringValue>. Send parameters can be either variable values or strings. Element <sendName> defines the parameter name used by the external application. When used in conjunction with element <variableRef> or element <stringValue> it clearly defines each sending parameter.

**Business rules decisions:**

- None identified

**Markup example:**

```
<externalApplication application="MMS">
<paraBasic>Update the Maintenance Management System
(MMS)</paraBasic>
<send>
<sendName>code</sendName>
<variableRef variableName="ECU.fault-code"/>
</send>
</externalApplication>
```

2.3.8.3 Receive value

**Description:** Element <receiveValue> contains element <variableRef> which is the variable to be assigned the value received from the external application. When the returned values exceed the number of receiveValue definitions, the remaining receiveValue information is discarded.

**Markup element:** <receiveValue>

**Attributes:**

- id (O), the identifier of the <receiveValue> element. Refer to Chap 3.9.5.2.1.2.

- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <variableRef> (M), the state table variable to receive the returned value. Refer to Para 2.3.4.1.11.

**Business rules decisions:**

- None identified

**Markup example:**

```
<externalApplication application="MMS">
<paraBasic>Receive Maintainer Name</paraBasic>
<receiveValue>
<variableRef variableName="Maintainer"/>
</receiveValue>
</externalApplication>
```

2.3.8.4 Receive by name

**Description:** Element <receiveByName> is used when the external application returns data in name/value pairs.

**Markup element:** <receiveByName>

**Attributes:**

- id (O), the identifier of the <receiveByName> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <returnedValueName> (M), a parameter name returned from the external application.
- <variableRef> (M), the state table variable to receive the returned value.

Element <receiveByName> contains element <returnedValueName> that is the name of the returned value, and element <variableRef> defining the variable to be updated with the returned value. When the external application returns a returned value name not defined by the element <returnedValueName>, that name/value pair is discarded.

**Business rules decisions:**

- None identified

**Markup example:**

```
<externalApplication application="MMS">
<paraBasic>Receive test results</paraBasic>
<receiveByName>
<returnedValueName>testresult</returnedValueName>
```

```
<variableRef variableName="Result Test 5"/>
</receiveByName>
</externalApplication>
```

2.3.8.5 Receive by position

**Description:** Element <receiveByPosition> is used when the external application returns data in a stream of delimited values by position.

**Markup element:** <receiveByPosition>

**Attributes:**

- id (O), the identifier of the <listItem> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.6.

**Child elements:**

- <returnedValuePosition> (M), the parameter position in the returned external application list.
- <variableRef> (M), the state table variable to receive the returned value. Refer to Para 2.3.4.1.11.

Element <receiveByPosition> contains element <returnedValuePosition>, the position of a returned value starting with 1, and element <variableRef> defining the variable to be updated with the returned value. When a returned value position is not defined, the information in that position is discarded.

**Business rules decisions:**

- None identified

**Markup example:**

```
<externalApplication application="MMS">
<paraBasic>Receive test scores</paraBasic>
<receiveByPosition>
<returnedValuePosition>1</returnedValuePosition>
<variableRef variableName="Score Test 1"/>
</receiveByPosition>
<receiveByPosition>
<returnedValuePosition>5</returnedValuePosition>
<variableRef variableName="Score Test 2"/>
</receiveByPosition>
</externalApplication>
```

## 2.4 Logic engine

The logic engine is a software component that executes the process data module (Refer to Chap 4.11 for the specification and Chap 7.6.1 for the requirements). It implements the behavior associated with process data module Schema elements. The primary job of the logic engine is to determine what to display next. In order to do that, it must traverse process data module elements, maintain a state table, display dialogs and evaluate expressions.

### 2.4.1 Traversal of process data module elements

The logic engine works through occurrences of the element <dmSeq> that are defined in a process data module. It processes each of element <dmNode>, element <dmIf>, and element <dmLoop> in order until there are none left to process.

For the element <dmNode>, the logic engine must evaluate applicability expressions for filtering, update the state table with variablePreSet assertions, provide content to be displayed to the user and again update the state table with variablePostSet assertions.

For the element <dmIf>, the logic engine must evaluate the condition and based on the result of the evaluation, process the element <dmThenSeq> or the element <dmElseSeq>.

For the element <dmLoop>, the logic engine must update the state table with the loop entrance assertion, evaluate the WHILE condition and, based on the result, process the element <dmSeq> contained in the element <dmLoop> or bypass it. At the end of the data module sequence, the logic engine updates the state table with the loop end assertion, re-evaluates the WHILE condition and either processes the data module sequence again or exits the loop.

### 2.4.2 Maintain state variables

In order to perform context filtering and sequencing, the logic engine must populate, store, retrieve, update, and delete state information in the state table.

The logic engine populates the state table by accepting assertions from elements of the process data module (<variablePreSets>, <variablePostSets>, <dialogs>, <externalApplications>, <assertions>). The state table is simply a collection of variables and their values.

The logic engine utilizes the state information from the state table to evaluate expressions used in applicability, data module branches, and data module loops. In order to perform expression evaluations the logic engine must retrieve the required data from the state table. If the required data is not present there, the logic engine must acquire the data using dialogs which can be associated to the variable during the variable declaration. In the case that a variable is used in an expression and has no value in the state table and no associated dialog, ie there is no way to obtain a value, the logic engine will throw an error condition and stop processing. This is considered a fatal error (refer to Chap 7.6.1).

### 2.4.3 Present dialogs

A dialog is an authored construct presented to the end user, using the element <dialog>, to find the value of a variable. Dialogs can be menu type, using the element <menu> or "fill-in-the-blank" type, using the element <userEntry>. The logic engine must display dialogs when:

- dialogs are explicitly authored in the element <dmNode>
- the logic engine requires a value for a variable to evaluate an expression and the state table holds no value for it. In this case, the logic engine displays the dialog associated with the variable in question.

### 2.4.4 Evaluate expressions

Expression evaluation allows the logic engine to determine the applicability of a data module without it being "hard-coded" in the metadata. Using data from the state table, the logic engine must be able to determine the truth of expressions such as [*Fault message* equal "Restart"], [*Continuity exists* = TRUE], and [*Gap* < 1,5]. Expressions can be associated with applicability, if conditions, or loop WHILE conditions.

In certain circumstances, the logic engine will populate the state table with values from evaluating expressions. For example, in FOR loops the logic engine can evaluate expressions such as [*Counter* = *Counter* + 1] and update variable *Counter* accordingly.

Expressions can be complex, such as: [[*Model* = "*A*"] and [[*Block* = "3"] or [*Block* = "4"]] or [*Change_2 installed* = TRUE]].

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Level of context filtering**. The project or the organization must decide the level at which to apply applicability for context filtering purposes. It is possible to author one data module that can support all configurations of the product. There are tradeoffs to consider between maintaining (and duplicating data in) more than one data module versus maintaining only one (but more complicated) data module with many provisions for configuration differences. Refer to Para 1.1.4.

**Model structure or expression**. The project or the organization must decide whether to use the applicability Model structure for configuration items and applicability expressions for dynamic variables only or use the applicability expressions for both configuration items and dynamic variables. The level of filtering desired, the filtering capability of the viewer, and the portability of the data must be taken into consideration. Refer to Para 1.1.4.

**Use of the attribute `checkQualification`**. The element <`dmSeq`> can contain a check using the attribute `checkQualification`. This is used to indicate that the whole sequence must be checked by a supervisor with a given qualification. The project or the organization must decide on its use. Refer to Para 2.3.4.

**Use of the attribute `skillLevelCode`**. The element <`dmSeq` > can contain an indication of the skill level required for the whole sequence using the attribute `skillLevelCode`. The project or the organization must decide when the skill level is to be used. Refer to Para 2.3.4.

**Method of tagging variable**. If more than one person, company, or program will be creating an external application call to the same application, the project or the organization should strongly consider using some method of tagging the variables being passed using element <`receiveByName`> or element <`receiveByPosition`>. This will preclude two calls receiving variables in a different order and one of the calls getting wrong results. Refer to Para 2.3.4.1.5.

**Dialogs associated with variables**. The project or the organization must decide if they will provide dialogs for variables in the variable declaration markup or author explicit dialogs whenever a variable in an expression might not have a value. Refer to Para 2.3.4.1.6.

**Menu vs. userEntry dialogs**. The project or the organization must decide when to use menu vs. fill-in type dialogs. Refer to Para 2.3.4.1.6.

**Dialog button captions.** The project or the organization must decide the button caption attributes that are used and determine the situation for the usage. Refer to Para 2.3.4.1.6.

**Dialog defaults**. The project or the organization must decide whether or not to use default choices in menus and/or default values in `userEntry` dialogs. Refer to Para 2.3.4.1.6.

**Dialog text consistency**. It is recommended that the project or the organization provide guidance on dialog look and feel. This includes, but is not limited to, using upper, lower, or sentence case prompts and menu choices. Refer to Para 2.3.4.1.6.

**Use of alternatives**. The project or the organization must decide whether to use this construct or not. Referencing an element <`proceduralStepAlt`> containing three elements <`proceduralStep`> is functionally the same as referencing the three elements <`proceduralStep`> individually. A possible benefit is in authoring where, if these three

elements are always or often referenced together, it is easier to reference them as a group. Refer to Para 2.3.4.2.

**Use of loops**. The project or the organization must decide where and when to use the loop construct. Loops are an effective way of sending a maintainer thru a sequence of steps a specified number of times or until some measurement is achieved. However, there can be an annoyance factor for the user in stepping thru the same information over and over. In addition, there is no way to exit a counter loop before the specified number of loops has been accomplished and no way to exit a measurement loop without providing an acceptable value for the loop variable. Loops add an element of authoring complexity, particularly when nested within other loops and branches. Refer to Para 2.3.4.4.

**Optional or mandatory entries**. The project or the organization must decide which entries in the dialog require responses and which have optional responses. Refer to Para 2.3.5.2, Para 2.3.5.2.2, and Para 2.3.5.3.

**userEntry validates error messages**. The project or the organization must decide if error messages are generated by the validation condition or author entered messages. Refer to Para 2.3.5.3.

**Variable naming and typing**. The project or the organization must provide authoring guidance about variable naming and typing. It is recommended that variable names are organized such that their function is easily recognizable. Guidance on typing will prevent similar variables from being differently typed, eg Boolean vs string. Refer to Para 2.3.7.

# 4 Examples

## 4.1 Example process diagrams

The following illustrate sample process data modules as executed by a logic engine. A step by step description of processing follows each diagram.

Fig 2 and Fig 3 are authoring views of a process data module. The step by step description that follows each figure explains how the logic engine processes the authored data. Fig 4 is the end user view of Fig 3 – the result of logic engine processing. It shows the screens the user will see and the contents of the state table that determine what the user sees.

ICN-S1000D-A-030905-A-U8025-00070-A-02-1

*Fig 2 Process diagram – Example sequencing data modules*

In Fig 2 above, the logic engine would:

- Step a (refer to (a) on diagram):
  Set up the state table for variables declared in the process element. Declare variable *Engine installed on system* to be type Boolean and variable *Engine temp* to be type real. With no initialize attribute, both variables will have value "noValue". This example illustrates variables without associated dialogs.
- Step b:
  The first element in the process data module sequence is the element <dmNode> containing a reference to the data module entitled "Prep for engine adjustment". Before displaying this data module, its applicability must be processed. If indeed the data module is to be displayed, the logic engine will provide it for display and stop. The user will press "Next" to proceed.
- Step c:
  The next dmNode contains a dialog. This dialog was explicitly authored in this location to obtain a value for variable *Engine Installed on System* in order for the logic engine to process the following dmNodeAlt. The user will select a menuChoice. When the user hits OK on the dialog, the associated assertions will be made to the state table and the logic engine will move to the next element in the process.
- Step d:
  The next element is a dmNodeAlt. The element <dmNodeAlt> contains two dmNodes containing dmRefs. Each dmNode also contains an expression to be evaluated about variable *Engine installed on system*. The logic engine will examine its state table to find a value for the variable and evaluate the first dmNode (e) expression.
- Step e:
  If this dmNode's expression evaluates to TRUE, the data module entitled "Start and run engine on system" will be displayed. Processing will stop until the user presses "Next". At that point, the logic engine will move past the dmNodeAlt to the next element in the process. If the expression does not evaluate to TRUE, the logic engine will evaluate the expression on the next dmNode in the dmNodeAlt (f).
- Step f:
  If this dmNode's expression evaluates to TRUE, the data module entitled "Start and run engine in shop" will be seen. Processing will stop until the user presses "Next". If the expression evaluates to FALSE, the logic engine will display nothing and move to the next element in the process.
- Step g:
  This dmNode contains a dialog explicitly authored at this place in order to populate the state table with a value for variable *Engine Temp*, which the logic engine will need to process the following loop. The user will provide a value for the variable which will be asserted to the state table.
- Step h:
  When "OK" is pressed, the logic engine will move to the element <dmLoop>. The loop condition [*Engine temp* greaterThan 500 degrees] will be evaluated using the *Engine temp* value just obtained from the preceding dialog.
- Step i:
  If the condition evaluates to TRUE, the adjustment data module will be displayed. Processing will then stop until the user presses "Next". If the condition evaluates to FALSE, the loop will not be traversed and the user will exit the process.
- Step j:
  When the user presses "Next", another *Engine temp* dialog will be displayed. The user's input will be recorded in the state table. At this point, the logic engine returns to step h and once again evaluates the loop condition. When the loop condition fails to be TRUE, the user

will exit the dmLoop and the process data module ends. The user will be informed that he has reached the end of task.

ICN-S1000D-A-030905-A-U8025-00071-A-02-1

*Fig 3 Process diagram – Example dmNodeAlt, external Application*

The procedure in Fig 3 would be processed as follows:

- Step a:
  Set up the variables to be used in the process. Three variables are defined. The variable *Continuity Exists* is defined as Boolean and initialized to "noValue". A dialog is provided for this variable. The variable *Model* is defined as a string variable. It is not initialized which allows it to maintain the value currently in the state table. If there is none, it will be initialized to "noValue". A dialog is provided for variable *Model*. The variable *Refdes* is defined as a string variable. It is initialized to "noValue" to discard the current value if one exists. The value of *Refdes* is always provided by the author. No dialog is required.
- Step b:
  This is a Step hierarchy on the first element <dmNode>. The logic engine would resolve applicability on the dmNode and the step content. Then the step content would be displayed on one screen such that the step hierarchy is clear to the viewer. After viewing, the user will press "Next" to proceed.
- Step c:
  The logic engine will attempt to evaluate the expression [*Continuity Exists* equal TRUE]. There is no value for variable *Continuity Exists* in the state table, so the logic engine will display its associated dialog in order to obtain a value from the user. If the expression evaluates to TRUE, the logic engine will begin processing (d), the dmNodeAlt. If the expression evaluates to FALSE, the logic engine will process dmNode (e).
- Step d:
  The two dmNodes in the alternative group have mutually exclusive applicability. The logic engine will evaluate the applicability expression on the dmNodeAlt members until one is found with a TRUE expression. If and when this occurs, the logic engine will provide the dmNode's dmRef for display. After viewing, the user will press "Next" to continue. If no dmNode in the dmNodeAlt passes applicability processing, the logic engine will process the next element in the sequence, or, if there is none, end the Process.
- Step e:
  The step content will be displayed on the screen. The user will press "Next" to continue and the variablePostSet will be asserted to the state table.
- Step f:
  This externalApplication calls a wiring diagram tool. The author passes the reference designator (*Refdes*) of the connector under consideration to the wiring tool. The wiring tool takes control at this point and does whatever it is designed to do. Meanwhile, the logic engine processes the next element in the sequence. The user can close the external application whenever he/she wishes and continue in the IETP.

# End User View & State Table

**State Table after variable declarations:**
*Model* = B
*Continuity Exists* = novalue
*Refdes* = novalue

**Screen 1 – Step content**

Open door 12
Disconnect connector 52P-F04J.
Check for continuity between pins 2 and 12.

*User presses Next*

**Screen 2 - Dialog**

Does Continuity Exist?
☐ Yes
☐ No
OK Cancel

*User answers Yes and presses OK*

**State Table after Dialog:**
*Model* = B
*Continuity Exists* = TRUE
*Refdes* = novalue

**Screen 3 – Referenced data scrolls as required in original window**

DM Replace Component A
Model B

## 4.2 Example user menus

### 4.2.1 User menu with single selection markup

The example markup below and example IETP dialog (Refer to Fig 5) is for a single selection menu dialog. In the example, the user is required to select one menu choice as determined in the element <menu> attribute choiceSelection value "single" and attribute mandatory value "1" (true) (line 3, in the markup example below). The example menu has three (3) menu choices. Each choice asserts the same state variable (*CheckCondition*), but assigns a different value (the first choice asserts "tire" (lines 7-12), second choice asserts "brake" (lines 16-21), and third choice asserts "light" (lines 36-41)).

The first menu choice (lines 5-13) is pre-selected (defaulted) by the attribute menuChoiceDefaultFlag value "1" (True).

The third menu choice has the element <enabledState> (lines 24-34). The logic engine evaluates the expression and determines if the choice is active (evaluates to TRUE) or disabled (evaluates to FALSE) (the enable expression is [*Environment* equal "night"]). In this example the state variable *Environment* was previously asserted to "day". The third choice is disabled (grayed out) since the element <enabledState> for the menu choice evaluates to FALSE.

User menu with single selection markup example:

| Line | Markup |
|---|---|
| 1 | `<dialog submitCaption="ok01" cancelCaption="ca01">` |
| 2 | `<title>Bicycle checkout</title>` |
| 3 | `<menu choiceType="select" menuChoiceFlow="list" choiceSelection="single" mandatory="1">` |
| 4 | `<prompt><paraBasic>Select the item to checkout:</paraBasic></prompt>` |
| 5 | `<menuChoice menuChoiceDefaultFlag="1">` |
| 6 | `<prompt><paraBasic>Tires</paraBasic></prompt>` |
| 7 | `<assertion>` |
| 8 | `<variableRef variableName="CheckCondition"/>` |
| 9 | `<expression>` |
| 10 | `<stringValue>tire</stringValue>` |
| 11 | `</expression>` |
| 12 | `</assertion>` |
| 13 | `</menuChoice>` |
| 14 | `<menuChoice menuChoiceDefaultFlag="0">` |
| 15 | `<prompt><paraBasic>Brakes</paraBasic></prompt>` |
| 16 | `<assertion>` |
| 17 | `<variableRef variableName="CheckCondition"/>` |

*Fig 5 Example multiple choice dialog menu*

### 4.2.2 User menu with push button external application launch

The example markup below and example IETP dialog (Refer to Fig 6) is for a menu dialog object using associated push buttons to launch an external application. In the example each menu choice has prompted text (element <prompt>) (lines 6, 22, 38, in the markup example below), a push button to launch an external application (element <pushButton>) (lines 7-13, 23-29, 39-45) and an assertion indicating the menu choice selected (element <assertion>) (lines 14-19, 30-35, 46-51). When a push button is selected the external application is launched and executed. After the external application is completed and closed, control returns to the dialog.

User menu with push button markup example:

| Line | Markup |
|---|---|
| 1 | `<dialog submitCaption="ok01" cancelCaption="ca01">` |
| 2 | `<title>Brake troubleshooting</title>` |
| 3 | `<menu choiceType="select" menuChoiceFlow="list" choiceSelection="single" mandatory="1">` |
| 4 | `<prompt><paraBasic>Select sound brakes are making:</paraBasic></prompt>` |
| 5 | `<menuChoice menuChoiceDefaultFlag="1">` |
| 6 | `<prompt><paraBasic>Squeaking</paraBasic></prompt>` |
| 7 | `<pushButton>` |
| 8 | `<prompt><paraBasic>Sample</paraBasic></prompt>` |
| 9 | `<externalApplication application="sound">` |
| 10 | `<paraBasic>Play audio sounds</paraBasic>` |
| 11 | `<send><stringValue>squeak.wav</stringValue></send>` |
| 12 | `</externalApplication>` |
| 13 | `</pushButton>` |
| 14 | `<assertion>` |

| Line | Markup |
|---|---|
| 15 | <variableRef variableName="BrakeSound"/> |
| 16 | <expression> |
| 17 | <stringValue>squeak</stringValue> |
| 18 | </expression> |
| 19 | </assertion> |
| 20 | </menuChoice> |
| 21 | <menuChoice menuChoiceDefaultFlag="0"> |
| 22 | <prompt><paraBasic>Clanking</paraBasic></prompt> |
| 23 | <pushButton> |
| 24 | <prompt><paraBasic>Sample</paraBasic></prompt> |
| 25 | <externalApplication application="sound"> |
| 26 | <paraBasic>Play audio sounds</paraBasic> |
| 27 | <send><stringValue>clank.wav</stringValue></send> |
| 28 | </externalApplication> |
| 29 | </pushButton> |
| 30 | <assertion> |
| 31 | <variableRef variableName="BrakeSound"/> |
| 32 | <expression> |
| 33 | <stringValue>clank</stringValue> |
| 34 | </expression> |
| 35 | </assertion> |
| 36 | </menuChoice> |
| 37 | <menuChoice menuChoiceDefaultFlag="0"> |
| 38 | <prompt><paraBasic>Scraping</paraBasic></prompt> |
| 39 | <pushButton> |
| 40 | <prompt><paraBasic>Sample</paraBasic></prompt> |
| 41 | <externalApplication application="sound"> |
| 42 | <paraBasic>Play audio sounds</paraBasic> |
| 43 | <send><stringValue>scrap.wav</stringValue></send> |
| 44 | </externalApplication> |
| 45 | </pushButton> |
| 46 | <assertion> |

| Line | Markup |
|---|---|
| 47 | `<variableRef variableName="BrakeSound"/>` |
| 48 | `<expression>` |
| 49 | `<stringValue>scrap</stringValue>` |
| 50 | `</expression>` |
| 51 | `</assertion>` |
| 52 | `</menuChoice>` |
| 53 | `</menu>` |
| 54 | `</dialog>` |

ICN-S1000D-A-030905-A-99994-00003-A-01-1

*Fig 6 Example dialog user menu with push button session*

### 4.2.3 User menu with external application launched from menu choice

The example markup below and example IETP dialog (Refer to Fig 7) is for a menu dialog object with associated external application that is launched when selected. In the example each menu choice has prompted text (element <`prompt`>) (lines 6, 19, 33, in the markup example below), an external application (element <`externalApplication`>) (lines 7-10, 20-23, 34-37), and an assertion indicating the menu choice selected (element <`assertion`>) (lines 11-16, 24-29, 38-43). When a menu choice is selected the external application is immediately launched and executed. After the external application is completed and closed, control returns to the dialog.

User menu with external application markup example:

| Line | Markup |
|---|---|
| 1 | <dialog submitCaption="ok01" cancelCaption="ca01"> |
| 2 | <title>Brake troubleshooting</title> |
| 3 | <menu choiceType="select" menuChoiceFlow="list" choiceSelection="single" mandatory="1"> |
| 4 | <prompt><paraBasic>Select sound brakes are making:</paraBasic></prompt> |
| 5 | <menuChoice menuChoiceDefaultFlag="1"> |
| 6 | <prompt><paraBasic>Squeaking</paraBasic></prompt> |
| 7 | <externalApplication application="sound"> |
| 8 | <paraBasic>Play audio sounds</paraBasic> |
| 9 | <send><stringValue>squeak.wav</stringValue></send> |
| 10 | </externalApplication> |
| 11 | <assertion> |
| 12 | <variableRef variableName="BrakeSound"/> |
| 13 | <expression> |
| 14 | <stringValue>squeak</stringValue> |
| 15 | </expression> |
| 16 | </assertion> |
| 17 | </menuChoice> |
| 18 | <menuChoice menuChoiceDefaultFlag="0"> |
| 19 | <prompt><paraBasic>Clanking</paraBasic></prompt> |
| 20 | <externalApplication application="sound"> |
| 21 | <paraBasic>Play audio sounds</paraBasic> |
| 22 | <send><stringValue>clank.wav</stringValue></send> |
| 23 | </externalApplication> |
| 24 | <assertion> |
| 25 | <variableRef variableName="BrakeSound"/> |
| 26 | <expression> |
| 27 | <stringValue>clank</stringValue> |
| 28 | </expression> |
| 29 | </assertion> |
| 30 | </menuChoice> |
| 31 | <menuChoice menuChoiceDefaultFlag="0"> |

| Line | Markup |
|---|---|
| 32 | `<prompt><paraBasic>Scraping</paraBasic></prompt>` |
| 33 | `<externalApplication application="sound">` |
| 34 | `<paraBasic>Play audio sounds</paraBasic>` |
| 35 | `<send><stringValue>scrap.wav</stringValue></send>` |
| 36 | `</externalApplication>` |
| 37 | `<assertion>` |
| 38 | `<variableRef variableName="BrakeSound"/>` |
| 39 | `<expression>` |
| 40 | `<stringValue>scrap</stringValue>` |
| 41 | `</expression>` |
| 42 | `</assertion>` |
| 43 | `</menuChoice>` |
| 44 | `</menu>` |
| 45 | `</dialog>` |

ICN-S1000D-A-030905-A-99994-00004-A-01-1

*Fig 7 Example dialog user menu with external application session*

### 4.2.4 User dialog entry example

The example markup below and example IETP dialog (Refer to Fig 8) is for a user entry dialog object using an entry validation and an assigned default entry value. The example depicts a dialog with a prompt and user entry data field.

The element <prompt> appears left of the user entry (no attribute textDisplayPosition is defined, therefore the inferred user entry prompt position is "left") (line 4, in the markup example below).

The user entry data will be asserted to the state variable named *Pressure* as defined by the element <variableRef> attribute variableName (line 5).

The default value is derived from the state variable *Pressure* (asserted prior to the integer value "45") and is assigned using the element <default> (lines 6-10) that evaluates the associated expression (the logic engine returns the stored value, "45", from the state table variable *Pressure*). The element <validate> defines that the allowable integer range is 30 thru 90 (lines 11-33). The element <validate> attribute errorMessage contains an error message to be shown when the evaluated expression (30 ≤ *Pressure* ≤ 90) is false.

Push button markup example:

| Line | Markup |
|---|---|
| 1 | `<dialog submitCaption="ok01" cancelCaption="ca01">` |
| 2 | `<title>Bicycle checkout</title>` |
| 3 | `<userEntry mandatory="1" dataEntryFieldLength="1">` |
| 4 | `<prompt><paraBasic>Tire pressure (PSI)</paraBasic></prompt>` |
| 5 | `<variableRef variableName="Pressure"/>` |
| 6 | `<default>` |
| 7 | `<expression>` |
| 8 | `<variableRef variableName="Pressure"/>` |
| 9 | `</expression>` |
| 10 | `</default>` |
| 11 | `<validate errorMessage="Tire pressure (PSI) must be 30 to 90">` |
| 12 | `<expression>` |
| 13 | `<expression>` |
| 14 | `<expression>` |
| 15 | `<integerValue>30</integerValue>` |
| 16 | `</expression>` |
| 17 | `<numberOperator numberOperation="lessThanOrEqual"/>` |
| 18 | `<expression>` |
| 19 | `<variableRef variableName="Pressure"/>` |
| 20 | `</expression>` |
| 21 | `</expression>` |

| Line | Markup |
|---|---|
| 22 | `<booleanOperator booleanOperation="and"/>` |
| 23 | `<expression>` |
| 24 | `<expression>` |
| 25 | `<variableRef variableName="Pressure"/>` |
| 26 | `</expression>` |
| 27 | `<numberOperator numberOperation="lessThanOrEqual"/>` |
| 28 | `<expression>` |
| 29 | `<integerValue>90</integerValue>` |
| 30 | `</expression>` |
| 31 | `</expression>` |
| 32 | `</expression>` |
| 33 | `</validate>` |
| 34 | `</userEntry>` |
| 35 | `</dialog>` |

ICN-S1000D-A-030905-A-99994-00005-A-01-1

*Fig 8 Example validate dialog entry session*

### 4.2.5 Pushbutton example

The example markup below and example IETP dialog (Refer to Fig 9) is for a push button dialog object. In the example the user needs to locate where to find the tire label information. When selected, the push button "Locate Tire Label" (lines 35-41, in the markup example below) launches an external application that displays an illustration about the tire label components. After closing the illustration, control returns to the dialog.

Push button markup example:

| Line | Markup |
|---|---|
| 1 | `<dialog submitCaption="ok01" cancelCaption="ca01">` |
| 2 | `<title>Bicycle checkout</title>` |
| 3 | `<userEntry mandatory="1" dataEntryFieldLength="1">` |
| 4 | `<prompt><paraBasic>Tire pressure (PSI)</paraBasic></prompt>` |
| 5 | `<variableRef variableName="Pressure"/>` |
| 6 | `<default>` |
| 7 | `<expression>` |

| Line | Markup |
|---|---|
| 8 | `<variableRef variableName="Pressure"/>` |
| 9 | `</expression>` |
| 10 | `</default>` |
| 11 | `<validate errorMessage="Tire pressure (PSI) must be 30 to 90">` |
| 12 | `<expression>` |
| 13 | `<expression>` |
| 14 | `<expression>` |
| 15 | `<integerValue>30</integerValue>` |
| 16 | `</expression>` |
| 17 | `<numberOperator numberOperation="lessThanOrEqual"/>` |
| 18 | `<expression>` |
| 19 | `<variableRef variableName="Pressure"/>` |
| 20 | `</expression>` |
| 21 | `</expression>` |
| 22 | `<booleanOperator booleanOperation="and"/>` |
| 23 | `<expression>` |
| 24 | `<expression>` |
| 25 | `<variableRef variableName="Pressure"/>` |
| 26 | `</expression>` |
| 27 | `<numberOperator numberOperation="lessThanOrEqual"/>` |
| 28 | `<expression>` |
| 29 | `<integerValue>90</integerValue>` |
| 30 | `</expression>` |
| 31 | `</expression>` |
| 32 | `</expression>` |
| 33 | `</validate>` |
| 34 | `</userEntry>` |
| 35 | `<pushButton>` |
| 36 | `<prompt><paraBasic>Locate Tire Label</paraBasic></prompt>` |
| 37 | `<externalApplication application="illustrate">` |
| 38 | `<paraBasic>Display CGM graphic</paraBasic>` |
| 39 | `<send><stringValue>tirelocate.cgm</stringValue></send>` |

| Line | Markup |
|---|---|
| 40 | `</externalApplication>` |
| 41 | `</pushButton>` |
| 42 | `</dialog>` |

ICN-S1000D-A-030905-A-99994-00006-A-01-1

*Fig 9 Example dialog push button session*

### 4.2.6 User message example

The example markup below and example IETP dialog (Refer to Fig 10) is for a message dialog object as a response from the IETP. In the example the user selects the bicycle component(s) for service information and submits the information to the IETP. The IETP processes service dates requests, stores the information in state variables *TireDue* and *GearDue*. Results are displayed in a dialog message (obtaining the information from state variables *TireDue* and *GearDue*).

User message markup example:

| Line | Markup |
|---|---|
| 1 | `<message submitCaption="ok01">` |
| 2 | `<title>Bicycle service due dates</title>` |
| 3 | `<prompt>` |

| Line | Markup |
|---|---|
| 4 | `<paraBasic>Tire is due </paraBasic>` |
| 5 | `<variableRef variableName="TireDue"/>` |
| 6 | `</prompt>` |
| 7 | `<prompt>` |
| 8 | `<paraBasic>Gear changer is due </paraBasic>` |
| 9 | `<variableRef variableName="GearDue"/>` |
| 10 | `</prompt>` |
| 11 | `</message>` |

ICN-S1000D-A-030905-A-99994-00007-A-01-1

*Fig 10 Example dialog user message session*

### 4.2.7 Complex dialog layout example

4.2.7.1 Complex dialog layout example

The example markup below and example IETP dialog (Refer to Fig 11) is a combination of the three (3) dialog types (menu, user entry, and message) using dialog grouping to display the information in a more logical layout.

The first dialog group (element <`dialogGroup`> lines 3-89, in the markup example below) contains information on bicycle tire size. The dialog group has a common title "Tire size" (line 4). The dialog types (element <`menu`> (lines 5-42) and element <`userEntry`> (lines 43-88)) are aligned horizontally (side-by-side). The group determines the tire size by:

– Measurement methods, of which the tire has four: ISO (ETRTO) (metric) (element <`menuChoice`> lines 6-14), Fractional (U.S.) (element <`menuChoice`> lines 15-23),

Decimal (U.S.) (element <menuChoice> lines 24-32), and French (metric) (element <menuChoice> lines 33-41) that are displayed in a dialog pull down (element <menu> attribute choiceType is "pulldown" line 5) menu.

– Tire size, of which there are three:
  - **ISO (ETRTO)** requires one (1) user entry (element <userEntry> attribute mandatory is "1" (lines 43-46)) and disables the remaining two user entries (element <enable> expression [*TireSizeMethod* notEqual "iso"] (lines 47-61) and second element <enable> expression [[*TireSizeMethod* equal "fractional"] OR [*TireSizeMethod* equal "decimal"]] (lines 62-88))
  - **French** requires two (2) user entries (element <userEntry> attribute mandatory is "1" (lines 43-46 and 47-61)) and disables the remaining one user entry (element <enable> expression [[*TireSizeMethod* equal "fractional"] OR [*TireSizeMethod* equal "decimal"]] (lines 62-88))
  - **Fractional** and **Decimal** require two (2) user entries (element <userEntry> attribute mandatory is "1" (lines 43-46 and 47-61)) and third user entry is optional (element <userEntry> attribute mandatory is "0" (lines 62-88)).

The second dialog group (element <dialogGroup> (lines 90-126)) contains information on the bicycle tire style. A separator divides to the two groups by setting the attribute dialogSeparator to "1" (line 90). The dialog group has a common title "Tire style" (line 91). The dialog types (element <menu> (lines 92-120) and element <message> (lines 121-125)) are aligned horizontally (side-by-side) and the group determines the tire style by:

– Tire style, of which there are three: Touring (lines 93-101), Racing (lines 102-110), and/or All Terrain (lines 111-119). Some tires are designed for one, two or all tire styles requiring a dialog multiple selection menu.
– A message (element <message> (lines 121-125)) to the user indicating that some bicycle tire style combinations may not be possible.

Complex dialog markup example:

| Line | Markup |
|---|---|
| 1 | `<dialog submitCaption="ok01" cancelCaption="ca01">` |
| 2 | `<title>Ordering tire</title>` |
| 3 | `<dialogGroup dialogSeparator="0">` |
| 4 | `<title>Tire size</title>` |
| 5 | `<menu choiceType="pulldown" menuChoiceFlow="list" choiceSelection="single" mandatory="1">` |
| 6 | `<menuChoice menuChoiceDefaultFlag="1">` |
| 7 | `<prompt><paraBasic>ISO (ETRTO)</paraBasic></prompt>` |
| 8 | `<assertion>` |
| 9 | `<variableRef variableName="TireSizeMethod"/>` |
| 10 | `<expression>` |
| 11 | `<stringValue>iso</stringValue>` |
| 12 | `</expression>` |

| Line | Markup |
|---|---|
| 13 | `</assertion>` |
| 14 | `</menuChoice>` |
| 15 | `<menuChoice menuChoiceDefaultFlag="0">` |
| 16 | `<prompt><paraBasic>Fractional</paraBasic></prompt>` |
| 17 | `<assertion>` |
| 18 | `<variableRef variableName="TireSizeMethod"/>` |
| 19 | `<expression>` |
| 20 | `<stringValue>fractional</stringValue>` |
| 21 | `</expression>` |
| 22 | `</assertion>` |
| 23 | `</menuChoice>` |

*Fig 11 Example complex dialog layout*

## 4.3 Example process data module

The example markup below and example IETP dialog (Refer to Fig 12 through Fig 20) represent an entire process data module, which includes external application, dialog box, procedural steps, and alternative choice.

The first part is the data module identification and status (element <identAndStatusSection> lines 2-31, in the markup example below) containing the data module number code and various status types' information. Most information is left out except for the applicability conditions within the data module (element <inlineApplicGroup> lines 10-27). The information contained in this element defines the applicability conditions used thruout the data module. The first applicability (lines 11-18) is when the user selects a correct answer and the second applicability (lines 19-26) is when the user selects a wrong answer. The system will filter the information when a reference from the alternative choice is requested.

The data module variables are declared in lines 34-41 and initialized to a value, as applicable.

The first node (screen of information) is in lines 43-50 and shown in Fig 12. The node begins a procedure to familiarize the user with the bike and provide a data module reference to the introduction.

The second node is in lines 51-84 and shown in Fig 13. The node is a dialog asking for information about the user. The dialog will verify (lines 61-63) the user's age is between 4-100. Fig 14 shows that when an invalid age is entered the error message (attribute errorMessage) is displayed. Additionally, the dialog determines if the user has ridden a bike previously (lines 65-75) through a menu selection. The information entered determines the nodes shown to the user (refer to Fig 15). Lines 77-82 is a reminder to the user about the dialog requirements.

Lines 85-162 evaluate John Smith's bike riding experience with the element <dmIf>. If John has not ridden a bike before, he will need some training before operating the bike. Otherwise, he will proceed directly to operating procedures (lines 163-177 and shown in Fig 20).

Unfortunately, John is inexperienced and requires additional information and training about the bike. John is required to pass a test before he can continue to operate the bike. John will repeat (lines 88-160) the loop dmseq nodes until he passes the test (line 95). The system keeps track of the number of attempts John takes to pass the test,. In the variable declarations, the counting variable *tourMistakes* is initialized to "0" (lines 89-94).

The next node (lines 97-105 and Fig 16) informs John that additional training is needed, since he is inexperienced. The following node (lines 106-108) is linked to a description data module to familiarize John with the bike. The node was personalized by using the variable *name* in the procedural step (line 100).

After completing the description data module, John is shown the next node (lines 109-114 and Fig 17) informing him that he will be tested on knowledge obtained. John can re-read the description data module by clicking the **BACK** button or clicking the **NEXT** button to take the test.

The test node (lines 115-143) is a menu dialog asking John which lever is the rear brake. If John selects the left brake lever (which is incorrect) the variable *tourCorrectAnswer* is asserted to FALSE and the variable *tourMistakes* is incremented (lines 121-128). If John selects the right brake lever (which is correct) the variable *tourCorrectAnswer* is asserted to TRUE and variable *tourFinished* is asserted to TRUE (lines 131-139).

After the test questions have been answered, the next node is determined by applicability of test answer (lines 144-158). The first alternative node (lines 145-151) references the applicability "wrongAnswer" (located at lines 19-26) that evaluates the variable *tourCorrectAnswer*

= FALSE. The second alternative node (lines 152-157) references the applicability "`rightAnswer`" (locate at lines 11-18) that evaluates the variable *`tourCorrectAnswer`* = TRUE.

Since John selected the left brake lever (he did not read carefully) the first alternative node is shown (refer to Fig 18) and displays the number of mistakes made by John by using the element <`variableRef`> and the variable *`tourMistakes`* (line 149). Too bad for John, he now must repeat the previous nodes to continue,since the criteria to remain in the loop is the variable *`tourFinished`* = FALSE (line 95). John will repeat nodes in Fig 16, and Fig 17. This time John read carefully and passed the test (Fig 19), and the asserted variable *`tourFinished`* is set to TRUE allowing him to exit the loop.

John has passed the test and is shown the last node (lines 163-177 and Fig 20), the procedure showing how to operate the bike.

# 1 General

The content section of a technical information repository data module must be structured in accordance with one of the following information types:

- Functional items. Refer to Chap 3.9.5.2.11.1.
- Circuit breakers. Refer to Chap 3.9.5.2.11.2.
- Parts. Refer to Chap 3.9.5.2.11.3.
- Zones. Refer to Chap 3.9.5.2.11.4.
- Access points. Refer to Chap 3.9.5.2.11.5.
- Organizations. Refer to Chap 3.9.5.2.11.6.
- Supplies, properties. Refer to Chap 3.9.5.2.11.7.
- Supplies, requirements. Refer to Chap 3.9.5.2.11.8.
- Tools. Refer to Chap 3.9.5.2.11.9.
- Functional and/or Physical areas. Refer to Chap 3.9.5.2.11.10.
- Controls and Indicators. Refer to Chap 3.9.5.2.11.11.

Among these information types, the general mechanism of those technical repository data modules is described in Chap 4.13.2.

# 2 Technical repository data module content

## 2.1 Content

**Description:** This element is used to contain the technical information repository data module core content.

**Markup element:** <`content`> (M)

**Attributes:**

- `id` (O), the identifier of the <`content`> element. Refer to Chap 3.9.5.2.1.2.

**Child elements:**

- <`refs`> (O). Refer to Chap 3.9.5.2.1.2.
- <`techRepository`> (M). Refer to Para 2.1.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use of the technical information repositories or not.

**Markup example:**

```
<content>
<techRepository>...</techRepository>
</content>
```

### 2.1.1 Technical repository

**Description:** This element is used to contain one type of technical information repository to be chosen among the list of technical information repository types.

**Markup element:** <`techRepository`> (M)

**Attributes:**

- `id` (O), the identifier of the <`techRepository`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

– `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

One and only one of the following elements has to be used:

– `<functionalItemRepository>` (O). Refer to Chap 3.9.5.2.11.1.
– `<circuitBreakerRepository>` (O). Refer to Chap 3.9.5.2.11.2.
– `<partRepository>` (O). Refer to Chap 3.9.5.2.11.3.
– `<zoneRepository>` (O). Refer to Chap 3.9.5.2.11.4.
– `<accessPoint>` (O). Refer to Chap 3.9.5.2.11.5.
– `<toolRepository>` (O). Refer to Chap 3.9.5.2.11.6.
– `<enterpriseRepository>` (O). Refer to Chap 3.9.5.2.11.7.
– `<supplyRepository>` (O). Refer to Chap 3.9.5.2.11.8.
– `<supplyRqmtRepository>` (O). Refer to Chap 3.9.5.2.11.9.
– `<functionalPhysicalAreaRepository>` (O). Refer to Chap 3.9.5.2.11.10.
– `<controlIndicatorRepository>` (O). Refer to Chap 3.9.5.2.11.11.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Technical information repository types to be used or not.

**Markup example:**

```
<techRepository>
<functionalItemRepository>...</functionalItemRepository>
</techRepository>
```

# 3 Business rules decisions

Business rules decisions include but are not limited to the following:

**Use of technical information repository**. Use of the technical information repository data module is optional. As its use changes the concept of self-contained data modules, the project or the organization must first decide whether to use it or not. Refer to Para 2.

**Technical information repository data module types to be used**. The project or the organization must decide which technical information repository data module types are to be used. Refer to Para 2.

# 4 Examples

```
– <content>
  <techRepository>
– <functionalItemRepository>...</functionalItemRepository>
– </techRepository>
  </content>
```

## 1 General

The technical information repository data module is used to capture and represent functional items and their properties.

The functional item can be used to uniquely identify an item performing a function in a given system at a given position, using the element <`functionalItemRef`>. Refer to Chap 3.9.5.1 for detail explanation.

# 2 Functional item technical repository data module content

## 2.1 Functional item repository

**Description:** This element is used to provide a list of functional items and their associated properties.

**Markup element:** <functionalItemRepository> (M)

**Attributes:**

- `id` (O), the identifier of the <`functionalItemRepository`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <`functionalItemSpec`> (M). Refer to Para 2.1.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use of the functional item technical repository data module or not.
- Use of a single or multiple functional item repository data modules.

**Markup example:**

```
<functionalItemRepository>
<functionalItemSpec>...</functionalItemSpec>
</functionalItemRepository>
```

### 2.1.1 Functional item specification

**Description:** This element represents one functional item. It contains its associated properties.

The functional item has a container alternate structure. Indeed, some of its properties are generic in that they do not differ from one product instance to another. Some other properties depend on the product configuration. Generic properties are directly defined under the functional item (container level), and other properties are defined under the alternate functional items. For some properties appearing both at container and alternate levels, the following rule must be applied: if the property is fulfilled in the alternate element, it supersedes the generic value stored in the container element.

Following container/alternate principles, data modules only refer to containers. Retrieval of the accurate alternate is achieved using applicability annotations.

Refer to Chap 4.13.3 for detail explanation of the container concept.

**Markup element:** <`functionalItemSpec`> (M)

**Attributes:**

- `id` (O), the identifier of the <`functionalItemSpec`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.

- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <`functionalItemIdent`> (M). Refer to Para 2.1.1.1.
- <`name`> (M). Refer to Para 2.1.1.2.
- <`functionalPhysicalAreaRef`> (O). Refer to Chap 3.9.5.2.11.10.
- <`functionaItemRefGroup`> (O). Refer to Para 2.1.1.3.
- <`functionalItemAlt`> (M). Refer to Para 2.1.1.4.
- <`refs`> (O). Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

- None identified

**Markup example:**

```
<functionalItemSpec>
<functionalItemIdent functionalItemNumber="..."
functionalItemType="..."/>

<name>...</name>

<functionalItemAlt>...</functionalItemAlt>
</functionalItemSpec>
```

2.1.1.1 Functional item identifier

**Description:** Contrary to the attribute `id`, this element identifies semantically the functional item as a result of its attributes. The codification of functional item identifier is up to the project or the organization.

**Markup element:** <`functionalItemIdent`> (M)

**Attributes:**

- `id` (O), the identifier of the <`functionalItemIdent`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `functionalItemNumber` (M), the functional item number as assigned by the functional item designer. Refer to Chap 3.9.5.1.
- `functionalItemType` (M), the type of the functional item. Refer to Chap 3.9.5.1.
- `manufacturerCodeValue` (O), the CAGE code of the functional item designer. As there is no standardized rule to assign a functional item number, the CAGE code of the functional item designer ensures the uniqueness of a functional item number.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- definition of the functional item types

– definition of the functional item number codification

**Markup example:**

```
<functionalItemIdent functionalItemNumber="8-DG-1"
functionalItemType="exact" manufacturerCodeValue="FAPE3"/>
```

2.1.1.2 Functional item name

**Description:** This element contains the textual functional definition of the functional item.

In some particular cases, the functional name can differ for some product instances. If it is different, the name must be provided also at the functional item alternate level. This name supersedes the one provided at container level.

**Markup element:** <name> (M)

**Attributes:**

– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– definition of the functional item name

**Markup example:**

```
<name> Left window-sliding</name>
```

2.1.1.3 References to other functional items

**Description:** This element provides relationships and the types of relationships with other functional items (eg sub-functional items or software functional items related to a hardware functional item).

Depending on the relationships, it can depend on the product instances or not. As a result, this element can be found at both container and alternate levels.

**Markup element:** <functionalItemRefGroup> (O)

**Attributes:**

– id (O), the identifier of the <functionalItemRefGroup> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– functionalItemRefType (M), the type of the relationship between the two functional items.
– authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– <functionalItemRef> (M). Refer to Chap 3.9.5.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– definition of the functional item relationship types

**Markup example:**

```
<functionalItemRefGroup functionalItemRefType="software">
<functionalItemRef .../>
</functionalItemRefGroup>
```

2.1.1.4 Alternate functional item

**Description:** This element contains the properties of the functional item that depend on the Product configuration. Thus this element contains applicability.

Configuration consistency between the various alternate functional items must be ensured. This means that, for a given product configuration and under given operational conditions, only one alternate functional item is applicable at one time for a container functional item.

**Markup element:** <functionalItemAlt> (M)

**Attributes:**

– applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
– id (O), the identifier of the <functionalItemAlt> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– altNumber (O), the alternate number to identify the alternate
– normativeComponentFlag (O), a flag to specify whether the functional item is a normative component or not. This attribute can have one of the following values:
  - "1" (yes) for normative component
  - "0" (no) for non-normative component
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– <name> (O). Refer to Para 2.1.1.2.
– <location> (O). Refer to Para 2.1.1.4.1.
– <accessFrom> (O). Refer to Para 2.1.1.4.2.
– <functionalPhysicalAreaRef> (O). Refer to Chap 3.9.5.2.11.10.
– <reqQuantity> (O), the required quantity. Refer to Chap 3.9.5.2.1.10.
– <functionalItemRefGroup> (O). Refer to Para 2.1.1.3.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– use of an alternate number

**Markup example:**

```
<functionalItemAlt applicRefId="applic-001">
...
</functionalItemAlt>
```

2.1.1.4.1 *Functional item location*

**Description:** This element is used to specify in which zone and/or optionally on which electric panel with coordinates if necessary, the functional item is located.

**Markup element:** <`location`> (O)

**Attributes:**

- `id` (O), the identifier of the <`location`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <`zoneRef`> (O). Refer to Chap 3.9.5.2.1.10.
- <`accessPointRef`> (O). Refer to Chap 3.9.5.2.1.10.
- <`quantity`> (O). Refer to Chap 3.9.5.2.1.10.

**Business rules decisions:**

- None identified

**Markup example:**

```
<location>
<zoneRef .../>
</location>
```

2.1.1.4.2 *Accesses to the functional item*

**Description:** This element allows specifying the zone(s) and/or access point(s) from which the functional item can be reached .

**Markup element:** <`accessFrom`> (O)

**Attributes:**

- `id` (O), the identifier of the <`accessFrom`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <`zoneRef`> (O). Refer to Chap 3.9.5.2.1.10.
- <`accessPointRef`> (O). Refer to Chap 3.9.5.2.1.10.

**Business rules decisions:**

- None identified

**Markup example:**

```
<accessFrom>
<accessPointRef .../>
</accessFrom>
```

# 3 Business rules decisions

Business rules decisions include, but are not limited, to the following:

**Use of the functional item technical information repository data modules.** The project or the organization must decide if the functional item technical information repository must be used or not. Refer to Para 2.

**Use of several functional item technical information repository data modules.** The project or the organization must decide whether there is one single functional item technical information repository data module or several depending of the SNS. In this case, granularity of these data modules is determined by the application of the SNS. Refer to Para 2.

**Definition of the functional item name.** The project or the organization must decide on the format of the functional item name and apply these rules consistently in the project. This includes the case of the names and the source from which they are derived. Refer to Para 2.1.1.2.

**Definition of the functional item relationship types.** The project or the organization must define the types of relationships to be implemented between functional items (eg sub-functional items, software functional items related to a hardware functional item) and how to populate the attribute `functionalItemRefType`. Refer to Para 2.1.1.3.

**Use of an alternate number.** The project or the organization must decide on the use of an alternate number or not. If used, the project or the organization must determine how to populate the attribute `altNumber` and must ensure it is consistently applied. Refer to Para 2.1.1.4.

# 4 Examples

The following example illustrates a functional item which is configuration dependant. As the zone can differ from one product range to the other, two alternate functional items have been defined.

```
<techRepository>
<functionalItemRepository>
<functionalItemSpec>
<functionalItemIdent functionalItemNumber="40-MJ-49"
functionalItemType="exact"/>
<name>P/BSW-MANUA) INFLATION,(DOOR U3R</name>
<functionalPhysicalAreaRef systemCode="52" subSystemCode="7"
subSubSystemCode="1" assyCode="28"/>
<functionalItemAlt altNumber="00001" applicRefId="appl-001"
normativeComponentFlag="1">
<location><zoneRef zoneNumber="292"/></location>
</functionalItemAlt>
<functionalItemAlt altNumber="00002" applicRefId="appl-002">
<location><zoneRef zoneNumber="293"/></location>
</functionalItemAlt>
</functionalItemSpec>
</functionalItemRepository>
</techRepository>
```

## 1 General

The technical information repository data module is used to capture and represent circuit breakers and their associated properties.

The circuit breaker can be used to uniquely identify a device used to break properly an electrical circuit or to inactivate an electrical function, using the element <`circuitBreakerRef`>. Refer to Chap 3.9.5.2.1.10 for detail explanation.

# 2 Circuit breaker technical repository data module content

## 2.1 Circuit breaker repository

**Description:** This element is used to provide a list of circuit breakers and their associated properties.

**Markup element:** <circuitBreakerRepository> (M)

**Attributes:**

- `id` (O), the identifier of the <`circuitBreakerRepository`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <`circuitBreakerSpec`> (M). Refer to Para 2.1.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of the circuit breaker technical repository data module or not
- use of a single or multiple circuit breaker repository data modules

**Markup example:**

```
<circuitBreakerRepository>
<circuitBreakerSpec>...</circuitBreakerSpec>
</circuitBreakerRepository>
```

### 2.1.1 Circuit breaker specification

**Description:** This element represents one circuit breaker. It contains its associated properties.

The circuit breaker has a container alternate structure. Indeed, some of its properties are generic in that they do not differ from one product instance to another. Some other properties depend on the product configuration. Generic properties are directly defined under the circuit breaker (container level), other properties are defined under the alternate circuit breakers.

For some properties appearing both at container and alternate levels, the following rule must be applied: if the property is fulfilled in the alternate element, it supersedes the generic value stored in the container element.

Following container/alternate principles, data modules only refer to containers. Retrieval of the accurate alternate is achieved using applicability annotations.

Refer to Chap 4.13.3 for detail explanation of the container concept.

**Markup element:** <`circuitBreakerSpec`> (M)

**Attributes:**

- `id` (O), the identifier of the <`circuitBreakerSpec`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <circuitBreakerIdent> (M). Refer to Para 2.1.1.1.
- <name> (M). Refer to Para 2.1.1.2.
- <functionalPhysicalAreaRef> (O) - populate in accordance with Chap 3.9.5.2.11.10.
- <circuitBreakerAlt> (M). Refer to Para 2.1.1.3.
- <refs> (O). Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

- None identified

**Markup example:**

```
<circuitBreakerSpec>
<circuitBreakerIdent circuitBreakerNumber="..."/>

<name>...</name>

<circuitBreakerAlt>...</circuitBreakerAlt>
</circuitBreakerSpec>
```

2.1.1.1 Circuit breaker identifier

**Description:** Contrary to the attribute id, this element identifies semantically the functional item as a result of its attributes.

**Markup element:** <circuitBreakerIdent> (M)

**Attributes:**

- id (O), the identifier of the <circuitBreakerIdent> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- circuitBreakerNumber (M), the circuit breaker number. Refer to Chap 3.9.5.2.1.10.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

```
<circuitBreakerIdent circuitBreakerNumber="9LW"/>
```

2.1.1.2 Circuit breaker name

**Description:** This element contains the textual functional definition of the circuit breaker.

In some particular cases, this name can differ for some product instances. If it is different, the name must be provided also at circuit breaker alternate level. This name supersedes the one provided at container level.

**Markup element:** <`name`> (M)

**Attributes:**

– `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Definition of the circuit breaker name.

**Markup example:**

```
<name>FMC-FAN PWR SPLY</name>
```

2.1.1.3 Alternate circuit breaker

**Description:** This element contains the properties of the circuit breaker that depend on the Product configuration. Thus this element contains applicability.

Configuration consistency between the various alternate circuit breakers must be ensured. This means that for a given product configuration and under given operational conditions, only one alternate circuit breaker is applicable at one time for a container circuit breaker.

**Markup element:** <`circuitBreakerAlt`> (M)

**Attributes:**

– `applicRefId` (O), the applicability information. Refer to Chap 3.9.5.3.
– `id` (O), the identifier of the <`circuitBreakerAlt`> element. Refer to Chap 3.9.5.2.1.2.
– `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– `altNumber` (O), the alternate number.
– `monitoredFlag` (O), a flag to specify whether the circuit breaker is monitored or not. This attribute can have one of the following values:
  - "`1`" (yes) for monitored circuit breakers
  - "`0`" (no) for non-monitored circuit breakers
– `collaredCircuitBreakerFlag` (O), a flag to specify whether the circuit breaker is fixed with a collar or not. This attribute can have one of the following values:
  - "`1`" (yes) for collared circuit breakers
  - "`0`" (no) for non-collared circuit breakers
– `provisionedFlag` (O), a flag to specify whether the circuit breaker is a provisioned one or not. This attribute can have one of the following values:
  - "`1`" (yes) for provisioned circuit breakers
  - "`0`" (no) for non-provisioned circuit breakers

– `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– <`name`> (O). Refer to Para 2.1.1.2.
– <`circuitBreakerClass`> (M). Refer to Para 2.1.1.3.1.
– <`location`> (O). Refer to Para 2.1.1.3.2.
– <`functionalPhysicalAreaRef`> (O). Refer to Chap 3.9.5.2.11.10.
– <`functionalItemRefGroup`> (O). Refer to Chapter 3.9.5.2.11.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of an alternate number.

**Markup example:**

```
<circuitBreakerAlt applicRefId="applic-001">
...
</circuitBreakerAlt>
```

*2.1.1.3.1 Circuit breaker class*

**Description:** This element indicates whether the circuit breaker is electronic or electro-mechanic.

**Markup element:** <`circuitBreakerClass`> (M)

**Attributes:**

– `id` (O), the identifier of the <`circuitBreakerClass`> element. Refer to Chap 3.9.5.2.1.2.
– `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– `circuitBreakerType` (M), the circuit breaker type (electronic or electro-mechanic). This attribute can have one of the following values:
  - "`eltro`" for electronic circuit breakers
  - "`elmec`" for electro-mechanic circuit breakers
– `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<circuitBreakerClass circuitBreakerType="eltro"/>
```

*2.1.1.3.2 Circuit breaker location*

**Description:** This element is used to specify on which electric panel, with coordinates if necessary, the circuit breaker is located.

**Markup element:** <`location`> (O)

**Attributes:**

- id (O), the identifier of the <location> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <zoneRef> (O). Refer to Chap 3.9.5.2.1.10.
- <accessPointRef> (O). Refer to Chap 3.9.5.2.1.10.
- <quantity> (O), the coordinates on the access panel. Refer to Chap 3.9.5.2.1.10.

**Business rules decisions:**

- None identified

**Markup example:**

```
<location>
<accessPointRef .../>
</location>
```

*2.1.1.3.3 References to functional items*

**Description:** This element provides relationships and the types of relationships with other functional items.

**Markup element:** <functionalItemRefGroup> (O)

**Attributes:**

- id (O), the identifier of the <functionalItemRefGroup> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- functionalItemRefType (M), the type of the relationship with the functional item.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <functionalItemRef> (M). Refer to Chap 3.9.5.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Definition of the functional item relationship types.

**Markup example:**

```
<functionalItemRefGroup functionalItemRefType="card">
<functionalItemRef .../>
</functionalItemRefGroup>
```

# 3 Business rules decisions

Business rules decisions include, but are not limited, to the following:

**Use of the circuit breaker repository data modules.** The project or the organization must decide if the circuit breaker technical information repository must be used or not. Refer to Para 2.

**Use of several circuit breaker technical information repository data modules.** The project or the organization must decide whether there is one single circuit breaker technical information repository data module or several depending of the SNS. In this case, granularity of these data modules is determined by the application of the SNS. Refer to Para 2.

**Definition of the circuit breaker name.** The project or the organization must decide on the format of the functional item name and apply these rules consistently in the project. This includes the case of the names and the source from which they are derived. Refer to Para 2.1.1.2.

**Use of an alternate number.** The project or the organization must decide on the use of an alternate number or not. If used, the project or the organization must determine how to populate the attribute `altNumber` and must ensure it is consistently applied. Refer to Para 2.1.1.3.

**Definition of the functional item relationship types.** The project or the organization must define the types of relationships to be implemented between a circuit breaker and functional items and how to populate the attribute `functionalItemRefType`. Refer to Para 2.1.1.3.

# 1 General

The technical information repository data module is used to capture and represent parts and their associated properties.

The part identification can be used to uniquely identify an item of the Product, forming part of an assembly or subassembly which is not normally broken down further.

# 2 Part technical repository data module content

## 2.1 Part repository

**Description:** This element is used to provide a list of parts and their associated properties.

**Markup element:** <partRepository> (M).

**Attributes:**

- id (O), the identifier of the <partRepository> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <partSpec> (M). Refer to Para 2.1.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use of the part technical repository data module or not.
- Use of a single or multiple part repository data modules.

**Markup example:**

```
<partRepository>
<partSpec>...</partSpec>
</partRepository>
```

### 2.1.1 Part specification

**Description:** This element represents a part. It contains its associated properties.

**Markup element:** <partSpec> (M).

**Attributes:**

- id (O), the identifier of the <partSpec> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <partIdent> (M). Refer to Para 2.1.1.1.
- <itemIdentData> (M). Refer to Para 2.1.1.2.
- <procurementData> (O). Refer to Para 2.1.1.3.
- <techData> (O). Refer to Para 2.1.1.4.
- <partRefGroup> (O). Refer to Para 2.1.1.5.
- <refs> (O). Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

- None identified

**Markup example:**

```
<partSpec>
<partIdent partNumberValue="..." manufacturerCodeValue="..."/>

<itemIdentData>...</itemIdentData>
</partSpec>
```

2.1.1.1 Part identifier

**Description:** Contrary to the attribute `id`, this element identifies semantically the part as a result of its attributes.

**Markup element:** <`partIdent`> (M).

**Attributes:**

- `id` (O), the identifier of the <`partIdent`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `partNumberValue` (M), the part number. Refer to Chap 3.9.5.2.7.
- `manufacturerCodeValue` (M), the CAGE/CAGE code of the part manufacturer. As there is no standardized rule to assign a part number, the CAGE code of the part manufacturer ensures the uniqueness of a part number. Refer to Chap 3.9.5.2.7.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

```
<partIdent partNumberValue="0-0204504-1"
manufacturerCodeValue="F0286"/>
```

2.1.1.2 Description data

**Description:** This element groups the properties that describe the part.

**Markup element:** <`itemIdentData`> (M).

**Attributes:**

- `id` (O), the identifier of the <`itemIdentData`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <`name`> (M). Refer to Para 2.1.1.2.1.
- <`partKeyword`> (O). Refer to Para 2.1.1.2.2.
- <`shortName`> (O). Refer to Para 2.1.1.2.3.

- <overlengthPartNumber> (O). Refer to Para 2.1.1.2.4.
- <stockNumber> (O). Refer to Para 2.1.1.2.5.
- <natoStockNumber> (O). Refer to Chap 3.9.5.1.

**Business rules decisions:**

- None identified

**Markup example:**

```
<itemIdentData>
<name>...</name>
</itemIdentData>
```

*2.1.1.2.1 Part designation*

**Description:** This element contains the textual designation of the part.

**Markup element:** <name> (M).

**Attributes:**

- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Definition of the part name.

**Markup example:**

```
<name>PANEL-INSIDE CONTROL</name>
```

*2.1.1.2.2 Part keyword*

**Description:** This element contains the single word name of the part, as defined for the civil aviation.

**Markup element:** <partKeyword> (O).

**Attributes:**

- id (O), the identifier of the <partKeyword> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use of the part keyword.

**Markup example:**

```
<partKeyword>PANEL</partKeyword>
```

2.1.1.2.3 *Part short designation*

**Description:** This element gives an abbreviated alternate name of the part designation corresponding to the element <name>. This short form for the name of the part designation is meant to be presented in the narrative of the data module to make the reading easier.

**Markup element:** <shortName> (O).

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<shortName>INSIDE CONTROL</shortName>
```

2.1.1.2.4 *Over length part number*

**Description:** This element contains the initial over length part number for projects, whose part numbers cannot exceed a given length. In this case, the over length part numbers are shortened and the shortened part number is used all over the documentation.

**Markup element:** <overLengthPartNumber> (O).

**Attributes:**

– id (O), the identifier of the <overLengthPartNumber> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the over length part number element.

**Markup example:**

```
<overLengthPartNumber>FDBA57-8-
3ASNK090A499</overLengthPartNumber>
```

2.1.1.2.5 *Customer or stock part number*

**Description:** This element is used to store the number assigned by the customer to identify and control the part in their inventory and control system. As this value depends on the customer,

the attribute applicRefId and the referenced element <applic>, which must be populated in accordance with Chap 3.9.5.3, allows specifying the customer.

**Markup element:** <stockNumber> (O).

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the <stockNumber> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

```
<stockNumber>AFR281324</stockNumber>
```

2.1.1.3 Procurement data

**Description:** This element groups the properties to procure the part.

**Markup element:** <procurementData> (O).

**Attributes:**

- id (O), the identifier of the <procurementData> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <supplierCode> (M). Refer to Para 2.1.1.3.1.
- <optionalSupplierCode> (O). Refer to Para 2.1.1.3.2.
- <buyerFurnishedEquipFlag> (O). Refer to Para 2.1.1.3.3.

**Business rules decisions:**

- None identified

**Markup example:**

```
<procurementData>...</procurementData>
```

*2.1.1.3.1 Supplier code*

**Description:** This element contains the CAGE code of the authorized prime source supplier for the part.

**Markup element:** <supplierCode> (O).

**Attributes:**

- `id` (O), the identifier of the <`supplierCode`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

```
<supplierCode>D4296</supplierCode>
```

2.1.1.3.2 *Optional supplier code*

**Description:** This element contains the CAGE/CAGE code of an additional optional supplier for the part.

**Markup element:** <`optionalSupplierCode`> (O).

**Attributes:**

- `id` (O), the identifier of the <`optionalSupplierCode`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

```
<optionalSupplierCode> 04795</optionalSupplierCode>
```

2.1.1.3.3 *Buyer furnished equipment flag*

**Description:** This element is used as a flag to specify whether the customer furnishes the part or not. As this value depends on the customer, the attribute `applicRefId` and the referenced element <`applic`>, both must be populated in accordance with Chap 3.9.5.3.

**Markup element:** <`buyerFurnishedEquipFlag`> (O).

**Attributes:**

- `applicRefId` (O), the applicability information. Refer to Chap 3.9.5.3.
- `id` (O), the identifier of the <`buyerFurnishedEquipFlag`> element. Refer to Chap 3.9.5.2.1.2.

- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

```
<buyerFurnishedEquipFlag/>
```

2.1.1.4 Technical data

**Description:** This element groups the technical properties related to the part.

**Markup element:** <techData> (O).

**Attributes:**

- id (O), the identifier of the <techData> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- etopsFlag (O), a flag to specify whether the part is an extended twin operations part or not. This attribute can have one of the following values:
  - "1" (yes) for etops parts
  - "0" (no) for non-etops parts
- hazardousFlag (O), a flag to indicate that the part is a hazardous product or not. This attribute can have one of the following values:
  - "1" (yes) for hazardous parts
  - "0" (no) for non-hazardous parts
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <sparePartClass> (O). Refer to Para 2.1.1.4.1.
- <usageCategory> (O). Refer to Para 2.1.1.4.2.
- <specDocument> (O). Refer to Para 2.1.1.4.3.
- <quantity> (O), the dimensions of the part. Refer to Chap 3.9.5.2.1.10.
- <physicalSecurityPilferageCode> (O). Refer to Chap 3.9.5.2.7.
- <unitOfIssue> (O). Refer to Chap 3.9.5.2.7.
- <specialStorage> (O). Refer to Chap 3.9.5.2.7.
- <calibrationMarker> (O). Refer to Chap 3.9.5.2.7.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use of the attribute etopsFlag.

**Markup example:**

```
<techData>...</techData>
```

*2.1.1.4.1 Spare part class code*

**Description:** This element is used to contain the spare part class code, through its attribute.

**Markup element:** <sparePartClass> (O).

**Attributes:**

- id (O), the identifier of the <sparePartClass> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- sparePartClassCode (M), specifies whether the spare part class code of the part. This attribute can have one of the following values:
  - "0" for non-procurable parts
  - "1" for expandable parts
  - "2" for rotable parts
  - "6" for repairable parts
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

```
<sparePartClass sparePartClassCode="1"/>
```

*2.1.1.4.2 Part usage category*

**Description:** This element is used to store, through its attribute, the usage category of the part, (manufacturer proprietary part, standards part, etc). Definition of the usage category values is up to the project.

**Markup element:** <usageCategory> (O).

**Attributes:**

- id (O), the identifier of the <usageCategory> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- usageCategoryCode (M)
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the usage category.

**Markup example:**

```
<usageCategory usageCategoryCode="10"/>
```

*2.1.1.4.3 Specification*

**Description:** This element is used to identify specifications of the part (drawing number for manufacturer parts, standard specification number for standard parts).

**Markup element:** <specDocument> (O).

**Attributes:**

– id (O), the identifier of the <specDocument> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– manufacturerCodeValue (O), the CAGE code of the specification owner.
– countryIsoCode (O), not used in this context
– specDocumentNumber (O), the identifier number of the specification or drawing.
– specDocumentType (O), the type of the specification (drawing or standard)
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<specDocument manufacturerCodeValue="I9009"
specDocumentNumber="86-2-IEC" specDocumentType="specification"/>
```

2.1.1.5 Relationships with other parts

**Description:** This element contains the different types of relationships with other parts.

**Markup element:** <partRefGroup> (O).

**Attributes:**

– id (O), the identifier of the <partRefGroup> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

At least one of the following elements must be used:

– <replacedBy> (O). Refer to Para 2.1.1.5.1.
– <optionalPart> (O). Refer to Para 2.1.1.5.2.
– <preferredSparePart> (O). Refer to Para 2.1.1.5.3.
– <optionalPart> (O). Refer to Para 2.1.1.5.4.

– <localFabricationMaterial> (O). Refer to Para 2.1.1.5.5.

**Business rules decisions:**

– None identified

**Markup example:**

```
<partRefGroup>...</partRefGroup>
```

2.1.1.5.1 *Replacement relationship*

**Description:** This element provides a part that can replace the defined part. The kind of replacement is specified by its attribute. It is also possible to associate a textual condition to this replacement relationship. Some replacement relationships can only be applicable to some product instances.

**Markup element:** <replacedBy> (O).

**Attributes:**

– applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
– id (O), the identifier of the <replacedBy> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– replacementCode (M), the type of replacement relationship (one or two ways, with condition or not). Definition of the codes is left to the projects.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– <partRef> (M), the spare part. Refer to Para 2.1.1.5.2.
– <functionalItemRef> (O), functional items for which the replacement relationship is valid. Populate in accordance with Chap 3.9.5.1.
– <replacementCond> (O). Refer to Para 2.1.1.5.3.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Definition of the part replacement relationship codes.

**Markup example:**

Part number B can replace part number A, oneway.

```
<partSpec>
<partIdent partNumberValue="A".../>
...
<partRefGroup>
<replacedBy>
<partRef partNumberValue="B".../>
</replacedBy>
</partRefGroup>
</partSpec>
```

2.1.1.5.2 *Part*

**Description:** This element is used to markup a part (outside of its specification in the part technical repository) and also allows referring to its position in the part technical repository.

**Markup element:** <partRef> (O)

**Attributes:**

- id (O), the identifier of the <partRef> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- partNumberValue (M)
- manufacturerCodeValue (M)
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <refs> (O), used to explicitly reference the part in the part technical repository. For implicit reference, the part semantic identifiers (part number and manufacturer code) are sufficient. Populate in accordance with Chap 3.9.5.2.1.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use explicit or implicit reference mechanism to the part technical repository.

**Markup example:**

```
<partRef partNumberValue="0-0204504-1"
manufacturerCodeValue="F0286"/>
```

2.1.1.5.3 *Replacement condition*

**Description:** This element is used to specify the condition that has to be fulfilled for the replacement, if any.

**Markup element:** <replacementCond> (O).

**Attributes:**

- id (O), the identifier of the <replacementCond> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

```
<replacementCond>EXCEPT IN THE HEATER ASSY</replacementCond>
```

2.1.1.5.4 *Optional part*

**Description:** This element provides one or several optional part(s), ie parts that are strictly equivalent to the defined part.

**Markup element:** <optionalPart> (O).

**Attributes:**

- id (O), the identifier of the <optionalPart> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <partRef> (M), the optional part. Refer to Para 2.1.1.5.2.

**Business rules decisions:**

- None identified

**Markup example:**

Part number 2 is optional to part number 1.

```
<partSpec>
<partIdent partNumberValue="1".../>
...
<partRefGroup>
<optionalPart>
<partRef partNumberValue="2".../>
</optionalPart>
</partRefGroup>
</partSpec>
```

2.1.1.5.5 *Preferred spare parts*

**Description:** This element provides one or several preferred spare part(s), ie parts that are recommended by the data provider.

**Markup element:** <preferredSparePart> (O).

**Attributes:**

- id (O), the identifier of the <preferredSparePart> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <partRef> (M), the preferred spare part. Refer to Para 2.1.1.5.2.

**Business rules decisions:**

- None identified

**Markup example:**

Part number 3 is preferred to part number 1.

```
<partSpec>
<partIdent partNumberValue="1".../>
...
```

```
<partRefGroup>
<preferredSparePart>
<partRef partNumberValue="3".../>
</preferredSparePart>
</partRefGroup>
</partSpec>
```

2.1.1.5.6 *Alternate parts*

**Description:** This element provides one or several alternate part(s), ie parts that can be used on condition that a modification has been performed. The description of the modification can be provided.

**Markup element:** <altPart> (O).

**Attributes:**

- id (O), the identifier of the <altPart> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <partRef> (M), the alternate part. Refer to Para 2.1.1.5.2.
- <altPartDescr> (O). Refer to Para 2.1.1.5.7.

**Business rules decisions:**

- None identified

**Markup example:**

Part number 4 is an alternate to part number 1.

```
<partSpec>
<partIdent partNumberValue="1".../>
...
<partRefGroup>
<altPart>
<partRef partNumberValue="4".../>
</altPart>
</partRefGroup>
</partSpec>
```

2.1.1.5.7 *Alternate part modification*

**Description:** This element is used to describe the modification to be performed on one alternate part.

**Markup element:** <altPartDescr> (O).

**Attributes:**

- id (O), the identifier of the <altPartDescr> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<altPartDescr>Loose part included in the
assembly.</altPartDescr>
```

*2.1.1.5.8 Raw parts*

**Description:** This element allows specifying one or several raw part(s) from which the defined part can be manufactured and their dimensions or quantity.

**Markup element:** <`localFabricationMaterial`> (O).

**Attributes:**

– `id` (O), the identifier of the <`localFabricationMaterial`> element. Refer to Chap 3.9.5.2.1.2.
– `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– <`partRef`> (M), the raw part.
– <`quantity`> (O), dimensions or quantity of raw part needed. Refer to Chap 3.9.5.2.1.10.

**Business rules decisions:**

– None identified

**Markup example:**

Part number 1 can be manufactured from part numbers 2 and 3.

```
<partSpec>
<partIdent partNumberValue="1".../>
...
<partRefGroup>
<localFabricationMaterial>
<partRef partNumberValue="2".../>
<partRef partNumberValue="3".../>
</localFabricationMaterial>
</partRefGroup>
</partSpec>
```

# 3 Business rules decisions

Business rules decisions include, but are not limited, to the following:

**Use of the part technical information repository data modules.** The project or the organization must decide if the part technical information repository must be used or not. Refer to Para 2.

**Use of several part technical information repository data modules.** The project or the organization must decide whether there is one single part technical information repository data

module or several depending of the SNS. In this case, granularity of these data modules is determined by the application of the SNS. Refer to Para 2.

**Definition of the part name, element <name>.** The project or the organization must decide on the format of the part name and apply these rules consistently in the project. This includes the case of the names and the source from which they are derived. Refer to Para 2.1.1.2.1.

**Use of the part keyword, element <partKeyword>.** The project or the organization must decide whether they use or not the over length part number. Refer to Para 2.1.1.2.2.

**Use of the over length part number, element <overLengthPartNumber>.** The project or the organization must decide whether they use or not the over length part number. Refer to Para 2.1.1.2.4.

**Use of extended twin operations, attribute etopsFlag.** The project or the organization must decide whether they use or not the air specific extended twin operations attribute. Refer to Para 2.1.1.2.4.

**Use of the usage category**. The project or the organization must decide on the use of the part usage category or not. If used, the project or the organization must determine how to populate the attribute usageCategoryCode. Refer to Para 2.1.1.4.2.

**Definition of the part replacement relationship codes.** The project or the organization must define the types of relationships between parts (eg one-way, two-ways, with condition...) and determine how to populate the attribute replacementCode. Refer to Para 2.1.1.5.

**Reference mechanism.** The project or the organization must decide whether to use the implicit or explicit reference mechanism to the part technical repository. Refer to Chap 4.13.2 and for details on the two reference mechanisms.

## 1 General

The technical information repository data module is used to capture and represent zone identification and related information.

The zone identification can be used to uniquely identify a structural area of the Product, using the element <zoneRef>. Refer to Chap 3.4.

# 2 Zones technical repository data module content

The technical information repository data module is used to provide the list of zones (element <zoneRepository>).

## 2.1 Zone repository

**Description:** This element is used to provide a list of zones and their associated properties.

**Markup element:** <zoneRepository> (M)

**Attributes:**

- id (O), the identifier of the <zoneRepository> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <figure> (O), zone illustrations. Refer to Chap 3.9.5.2.1.7.
- <zoneSpec> (M). Refer to Para 2.1.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use of the zone technical repository data module or not.
- Use of a single or multiple zone repository data modules.

**Markup example:**

```
<zoneRepository>
<zoneSpec>...</zoneSpec>
</zoneRepository>
```

### 2.1.1 Zone specification

**Description:** This element represents one zone. It contains its associated properties.

The zone has a container alternate structure. Indeed, some of its properties are generic in that they do not differ from a product instance to another. Some other properties depend on the product configuration. Generic properties are directly defined under the zone (container level), other properties are defined under the alternate zones. For some properties appearing both at container and alternate levels, the following rule must be applied: if the property is fulfilled in the alternate element, it supersedes the generic value stored in the container element.

Following container/alternate principles, data modules only refer to containers. Retrieval of the accurate alternate is achieved using applicability annotations.

Refer to Chap 4.13.3 for detail explanation of the container concept.

**Markup element:** <zoneSpec> (M)

**Attributes:**

- id (O), the identifier of the <zoneSpec> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <`zoneIdent`> (M). Refer to Para 2.1.1.1.
- <`zoneRefGroup`> (O). Refer to Para 2.1.1.2.
- <`zoneAlt`> (M). Refer to Para 2.1.1.3.
- <`refs`> (O). Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

- None identified

**Markup example:**

```
<zoneSpec>
<zoneIdent zoneNumber="..."/>

<zoneAlt>...</zoneAlt>
</zoneSpec>
```

2.1.1.1 Zone identifier

**Description:** Contrary to the `id` attribute, this element identifies semantically the zone as a result of its attributes.

**Markup element:** <`zoneIdent`> (M)

**Attributes:**

- `zoneNumber` (M), the zone number. Refer to Chap 3.4.
- `id` (O), the identifier of the <`zoneIdent`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

```
<zoneIdent zoneNumber="121"/>
```

2.1.1.2 References to other zones

**Description:** This element provides relationships and the type of relationship with other zones (eg sub-zones).

A proper use of this element enables to retrieve the zone breakdown (major zones that contain sub zones that contain specific zones).

Depending on the relationships, it can depend on the product instances or not. As a result, this element can be found at both container and alternate levels.

**Markup element:** <zoneRefGroup> (O)

**Attributes:**

- zoneRefType (M), the type of the relationship between the two zones
- id (O), the identifier of the <zoneRefGroup> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <zoneRef> (M). The referenced zone. The target is always a zone container. Refer to Chap 3.9.5.2.1.10.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Definition of the zone relationship types.

**Markup example:**

```
<zoneRefGroup zoneRefType="breakdown">
<zoneRef .../>
</zoneRefGroup>
```

2.1.1.3 Alternate zone

**Description:** This element contains the properties of the zone that depend on the Product configuration. Thus this element contains applicability.

Configuration consistency between the various alternate zones must be ensured. This means that for a given product configuration and under given operational conditions, only one alternate zone is applicable at one time for a container zone.

**Markup element:** <zoneAlt> (M)

**Attributes:**

- altNumber (O), the alternate number.
- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the <zoneAlt> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <itemDescr> (M). Refer to Para 2.1.1.3.1.
- <zoneSide> (O). Refer to Para 2.1.1.3.2.

- <boundaryFrom> (O). Refer to Para 2.1.1.3.3.
- <boundaryTo> (O). Refer to Para 2.1.1.3.3.
- <zoneRefGroup> (O). Refer to Para 2.1.1.2.
- <internalRef> (O), reference to the illustration where the zone is illustrated. Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use of an alternate number.

**Markup example:**

```
<zoneAlt applicRefId="applic-001">
...
</zoneAlt>
```

2.1.1.3.1 *Description*

**Description:** This element is used to contain the textual description of the father element.

**Markup element:** <itemDescr> (M)

**Attributes:**

- id (O), the identifier of the <itemDescr> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

```
<itemDescr> LOWER THIRD OF FUSELAGE (BELOW CABIN FLOOR)
INCLUDING RADOME TO FORWARD FACE OF REAR PRESSURE BULKHEAD NOSE
CONE STA650 TO FR95</itemDescr>
```

2.1.1.3.2 *Zone side*

**Description:** This element indicates on which side of the Product, the zone is located.

**Markup element:** <zoneSide> (M).

**Attributes:**

- zoneSideValue (M), the side of the Product where the zone is located. This attribute can have one of the following values:
  - "lh" for a zone located on the left side of the Product
  - "rh" for a zone located on the right side of the Product
  - "lr" when the zone is not located on one side of the Product
- id (O), the identifier of the <zoneSide> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

– `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<zoneSide zoneSideValue="lh"/>
```

*2.1.1.3.3 Zone boundaries*

**Description:** These elements are used to define the boundaries of a zone, respectively the start and the end boundaries.

A zone can have several "from" boundaries and several "to" boundaries.

ICN-S1000D-A-030905-A-FAPE3-00007-A-001-01

*Fig 1 Zone boundaries*

**Markup element:** <`boundaryFrom`> (O), <`boundaryTo`> (O)

**Attributes:**

– `id` (O), the identifier of the <`boundaryFrom`>, <`boundaryTo`> element. Refer to Chap 3.9.5.2.1.2.
– `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– <`boundary`> (M). Refer to Para 2.1.1.3.4.

**Business rules decisions:**

– None identified

**Markup example:**

```
<boundaryFrom>
<boundary>...</boundary>
</boundaryFrom>
<boundaryTo>
```

```
<boundary>...</boundary>
</boundaryTo>
```

2.1.1.3.4 *A boundary*

**Description:** This element describes a boundary. A boundary can be expressed textually or with specific measures (rib, frame...)

**Markup element:** <boundary> (M)

**Attributes:**

- id (O), the identifier of the <boundary> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <quantity> (O), to express the boundary in terms of stringers, ribs, frames or stations. Refer to Chap 3.9.5.2.1.10.

**Business rules decisions:**

- None identified

**Markup example:**

```
<boundary>
<quantity>...</quantity>
</boundary>
```

# 3 Business rules decisions

Business rules decisions include, but are not limited, to the following:

**Use of the zone technical information repository data modules.** The project or the organization must decide if the zone technical information repository must be used or not. Refer to Para 2.1.

**Use of several zone technical information repository data module.** The project or the organization must decide whether there is one single zone technical information repository data module or several depending of the SNS. In this case, granularity of these data modules is determined by the application of the SNS. Refer to Para 2.

**Definition of the zone relationship types.** The project or the organization must define the types of relationships to be implemented between zones (eg sub-zones) and how to populate the attribute functionalItemRefType. Refer to Para 2.1.1.2.

**Use of an alternate number.** The project or the organization must decide on the use of an alternate number or not. If used, the project or the organization must determine how to populate the attribute altNumber and must ensure it is consistently applied. Refer to Para 2.1.1.3.

## 1 General

The technical information repository data module is used to capture and represent access point identification and related information. The access panels and doors identifications can be used to uniquely identify an access point versus a larger way (generally equipped with a handle), to be opened to getting access to the equipment, by using the element <`accessPoint`>. Refer to Chap 3.9.5.2.1.10.

# 2 Access points technical repository data module content

## 2.1 Access point repository

**Description:** This element is used to provide a list of access points and their associated properties.

**Markup element:** <accessPointRepository> (M)

**Attributes:**

- id (O), the identifier of the <accessPointRepository> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <figure> (O), access point illustrations. Refer to Chap 3.9.5.2.1.7.
- <accessPointSpec> (M). Refer to Para 2.1.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of the access point technical repository data module or not
- use of a single or multiple access point repository data modules

**Markup example:**

```
<accessPointRepository>
<accessPointSpec>...</accessPointSpec>
</accessPointRepository>
```

### 2.1.1 Access point specification

**Description:** This element represents one access point. It contains its associated properties.

The access point has a container-alternate structure. Indeed, some of its properties are generic in that they do not differ from one product instance to another. Some other properties depend on the product configuration. Generic properties are directly defined under the access point (container level), other properties are defined under the alternate access points. For some properties appearing both at container and alternate levels, the following rule must be applied: if the property is fulfilled in the alternate element, it supersedes the generic value stored in the container element.

Following container/alternate principles, data modules only refer to containers. Retrieval of the accurate alternate is achieved using applicability annotations.

Refer to Chap 4.13.3 for detail explanation of the container concept.

**Markup element:** <accessPointSpec> (M)

**Attributes:**

- id (O), the identifier of the <accessPointSpec> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.

- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <`accessPointIdent`> (M). Refer to Para 2.1.1.1.
- <`accessPointRefGroup`> (O). Refer to Para 2.1.1.2.
- <`accessPointAlt`> (M). Refer to Para 2.1.1.3.
- <`refs`> (O). Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

- None identified

**Markup example:**

```
<accessPointSpec>
<accessPointIdent accessPointNumber="..."/>

<accessPointAlt>...</accessPointAlt>
</accessPointSpec>
```

2.1.1.1 Access point identifier

**Description:** Contrary to the attribute `id`, this element identifies semantically the access point with regard to its attributes.

**Markup element:** <`accessPointIdent`> (M)

**Attributes:**

- `id` (O), the identifier of the <`accessPointIdent`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `accessPointNumber` (M), the access point number. Refer to Chap 3.9.5.2.1.10.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

```
<accessPointIdent accessPointNumber="121"/>
```

2.1.1.2 References to other access points

**Description:** This element allows providing relationships and the type of relationship with other access points (eg sub-access points).

Depending on the relationships, it can depend on the product instances or not. As a result, this element can be found at both container and alternate levels.

**Markup element:** <`accessPointRefGroup`> (O)

**Attributes:**

- id (O), the identifier of the <accessPointRefGroup> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- accessPointRefType (M), the type of the relationship between the two access points.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <accessPointRef> (M). The referenced zone. The target is always a zone container. Refer to Chap 3.9.5.2.1.10.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Definition of the access point relationship types.

**Markup example:**

```
<accessPointRefGroup accessPointRefType="contains">
<accessPointRef .../>
</accessPointRefGroup>
```

2.1.1.3 Alternate access points

**Description:** This element contains the properties of the access point that depend on the Product configuration. Thus this element contains applicability.

Configuration consistency between the various alternate access points must be ensured. This means that for a given product configuration and under given operational conditions, only one alternate access point is applicable at one time for a container zone.

**Markup element:** <accessPointAlt> (M)

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the <accessPointAlt> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- altNumber (O), the alternate number.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <accessPointType> (M). Refer to Para 2.1.1.3.1.
- <zoneRef> (M). The zone where the access point is located. The target is always a zone container. Refer to Chap 3.9.5.2.1.10.
- <accessTo> (O). Refer to Para 2.1.1.3.2.
- <accessPanelRefGroup> (O). Refer to Para 2.1.1.2.

- <fastener> (O). Refer to Para 2.1.1.3.4.
- <quantity> (O), the access point dimensions. Refer to Chap 3.9.5.2.1.10.
- <hoursToOpen> (O). Refer to Para 2.1.1.3.7.
- <internalRef> (O), reference to the illustration where the access point is illustrated. Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

- None identified

**Markup example:**

```
<accessPointAlt applicRefId="applic-001">
<accessPointType .../>
<zoneRef .../>
</accessPointAlt>
```

2.1.1.3.1 *Access point type*

**Description:** This element is used to specify, through its attribute, whether the access point is a panel, a door, an electrical panel or any other type of access point.

**Markup element:** <accessPointType> (M)

**Attributes:**

- id (O), the identifier of the <accessPointType> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- accessPointTypeValue (M), the access point type value. Refer to Chap 3.9.6.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

```
<accessPointType accessPointTypeValue="accpnl01"/>
```

2.1.1.3.2 *Items reachable from the access point*

**Description:** This element allows listing items that can be reached from the access point. Those items can be functional items or other items.

**Markup element:** <accessTo> (O)

**Attributes:**

- id (O), the identifier of the <accessTo> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <functionalItemRef> (O). Refer to Chap 3.9.5.1.
- <otherItems> (O). Refer to Para 2.1.1.3.3.

**Business rules decisions:**

- None identified

**Markup example:**

```
<accessTo>
<functionalItemRef .../>
</accessTo>
```

*2.1.1.3.3 Other items*

**Description:** This element describes textually which items can be reached from the access point.

**Markup element:** <otherItems> (O)

**Attributes:**

- id (O), the identifier of the <otherItems> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

```
<otherItems>INTERNAL STRUCTURE, ELECTRICAL WIRING, CONNECTORS
PLATE</otherItems>
```

*2.1.1.3.4 Fastener*

**Description:** This element is used to store access point fastener information.

**Markup element:** <fastener> (O)

**Attributes:**

- id (O), the identifier of the <fastener> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- hingedFastenerFlag (O), a flag to indicate if the access point is hinged or not. This attribute can have one of the following values:
  - "1" (yes) for hinged access points
  - "0" (no) for non-hinged access points
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <fastenerType> (M). Refer to Para 2.1.1.3.5.
- <fastenerQuantity> (M). Refer to Para 2.1.1.3.6.

**Business rules decisions:**

- None identified

**Markup example:**

```
<fastener hingedFastenerFlag="0">
<fastenerType>...</fastenerType>
<fastenerQuantity>...</fastenerQuantity>
</fastener>
```

2.1.1.3.5 *Fastener type*

**Description:** This element is used to indicate the type of the fastener.

**Markup element:** <fastenerType> (M)

**Attributes:**

- id (O), the identifier of the <fastenerType> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

```
<fastenerType>SF</fastenerType>
```

2.1.1.3.6 *Fastener quantity*

**Description:** This element is used to indicate the quantity of fasteners.

**Markup element:** <fastenerQuantity> (M)

**Attributes:**

- id (O), the identifier of the <fastenerQuantity> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- None

**Business rules decisions:**

– None identified

**Markup example:**

```
<fastenerQuantity>8</fastenerQuantity>
```

*2.1.1.3.7 Elapsed time to open the access point*

**Description:** This element indicates the elapsed time necessary to open the access point.

**Markup element:** <hoursToOpen> (O)

**Attributes:**

– id (O), the identifier of the <hoursToOpen> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<hoursToOpen>0,2</hoursToOpen>
```

# 3 Business rules decisions

Business rules decisions include, but are not limited, to the following:

**Use of the access point technical information repository data modules.** The project or the organization must decide if the access point technical information repository must be used or not. Refer to Para 2.

**Use of several access point technical information repository data module.** The project or the organization must decide whether there is one single access point technical information repository data module or several depending of the SNS. In this case, granularity of these data modules is determined by the application of the SNS. Refer to Para 2.

**Definition of the access point relationship types.** The project or the organization must define the types of relationships to be implemented between access points (eg sub-access points) and how to populate the attribute accessPointRefType. Refer to Para 2.1.1.2.

**Use of an alternate number.** The project or the organization must decide on the use of an alternate number or not. If used, the project or the organization must determine how to populate the attribute altNumber and must ensure it is consistently applied. Refer to Para 2.1.1.3.

## 1 General

The technical information repository data module is used to capture and represent enterprise identification and information.

The enterprise identification can be used to uniquely identify an enterprise involved in the manufacturing or in the supply of the Product or part of it.

## 2 Enterprise list

**Description:** The element <`enterpriseRepository`> contains a list of one or more element enterprise descriptions

**Markup element:** <enterpriseRepository> (M)

**Attributes:**

- id (O), the identifier of the <enterpriseRepository> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <enterpriseSpec> (M). Refer to Para 2.1

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of the enterprise technical repository

**Markup example:**

```
<enterpriseRepository>
<enterpriseSpec id="C001">
...
</enterpriseSpec>
</enterpriseRepository>
```

## 2.1 Enterprise specification

**Description:** The element <enterpriseSpec> contains the unique enterprise information for any enterprise that is involved in the development or supply of the product. It contains information about the enterprise such as manufacturer code, enterprise name, and business unit.

**Markup element:** <enterpriseSpec> (M)

**Attributes:**

- id (O), the identifier of the <enterpriseRepository> element. Refer to Chap 3.9.5.2.1.2
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11

**Child elements:**

- <enterpriseIdent> (M). Refer to Para 2.2
- <enterpriseIdentAlt> (O). Refer to Para 2.3
- <enterpriseName> (M). Refer to Para 2.4
- <businessUnit> (O). Refer to Para 2.5
- <enterpriseRef> (O). Refer to Para 2.6
- <refs> (O). References must be populated in accordance with Chap 3.9.5.2.1.2

**Business rules decisions:**

– None identified

**Markup example:**

```
<enterpriseSpec id="C001">
...
</enterpriseSpec>
```

## 2.2 Enterprise identification

**Description:** The element <enterpriseIdent> identifies the enterprise, through its CAGE code.

**Markup element:** <enterpriseIdent> (C)

**Attributes:**

– manufacturerCodeValue (M), containing the CAGE code of the enterprise.
– id (O), the identifier of the <enterpriseIdent> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<enterpriseIdent manufacturerCodeValue="KZ444"/>
```

## 2.3 Alternate enterprise identification

**Description:** The element <enterpriseIdentAlt> provides an alternate method of identifying an enterprise where the enterprise doesn't have a CAGE code.

**Markup element:** <enterpriseIdentAlt> (O)

**Attributes:**

– altCode (M), containing the enterprise identification code when no CAGE code is available.
– altCodeType (M), containing the type of code being used.

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<enterpriseIdentAlt altCode="1235" altCodeType="DUNS"/>
```

## 2.4 Enterprise name

**Description:** The element <enterpriseName> contains a string identifying the enterprise name.

**Markup element:** <enterpriseName> (M)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<enterpriseName>UTOPIA plc</enterpriseName>
```

## 2.5 Business unit

**Description:** The element <businessUnit> contains information about the business, including name, address, and contacts.

**Markup element:** <businessUnit> (O)

**Attributes:**

– id (O), the identifier of the <businessUnit> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– <businessUnitName> (M). Refer to Para 2.5.1.
– <businessUnitAddress> (O). Refer to Para 2.5.2.
– <contactPerson> (O). Refer to Para 2.5.3.

**Business rules decisions:**

– None identified

**Markup example:**

```
<businessUnit>
<businessUnitName>Customers Services Business
Line</businessUnitName>
<businessUnitAddress>
...
</businessUnitAddress>
</businessUnit>
```

### 2.5.1 Business unit name

**Description:** The element <businessUnitName> contains a string identifying the name of the business unit.

**Markup element:** <businessUnitName> (C)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<businessUnitName>Customers Services Business
Line</businessUnitName>
```

### 2.5.2 Business unit address

**Description:** The element <businessUnitAddress> contains the information required to contact the business unit.

**Markup element:** <businessUnitAddress> (O)

**Attributes:**

– id (O), the identifier of the <businessUnitAddress> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– <department> (O). Refer to Para 2.5.2.1.
– <street> (O). Refer to Para 2.5.2.2,
– <postOfficeBox> (O). Refer to Para 2.5.2.3.
– <postalZipCode> (O). Refer to Para 2.5.2.4.
– <city> (M). Refer to Para 2.5.2.5.
– <country> (M). Refer to Para 2.5.2.5.
– <state> (O). Refer to Para 2.5.2.7.
– <province> (O). Refer to Para 2.5.2.8.
– <building> (O). Refer to Para 2.5.2.9.
– <room> (O). Refer to Para 2.5.2.10.
– <phoneNumber> (O). Refer to Para 2.5.2.11.
– <faxNumber> (O). Refer to Para 2.5.2.12.
– <email> (O). Refer to Para 2.5.2.13.
– <internet> (O). Refer to Para 2.5.2.14.
– <SITA> (O). Refer to Para 2.5.2.15.

**Business rules decisions:**

– None identified

**Markup example:**

```
<businessUnitAddress>
<street>heaven street</street>
<postalZipCode>99999</postalZipCode><city>Saint Vitus</city>
<country>UTOPIA</country>
<phoneNumber>111 222 333 444</phoneNumber>
<faxNumber>111 222 333 445</faxNumber>
<email>customers_services@utopia.com</email>
<email>info@utopia.com</email>
<internet>www.utopia.customers.services.online.com</internet>
<internet>www.utopia.online.com</internet>
</businessUnitAddress>
```

2.5.2.1 Department

**Description:** The element <department> contains the identification of the business department.

**Markup element:** <department> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<department>Happy support group</department>
```

2.5.2.2 Street

**Description:** The element <street> contains the street address of the business.

**Markup element:** <street> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<street>123 Happy Lane</street>
```

2.5.2.3 Post office box

**Description:** The element <postOfficeBox> contains the post office box of the business defined.

**Markup element:** <postOfficeBox> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<postOfficeBox>12345</postOfficeBox>
```

2.5.2.4 Postal zip code

**Description:** The element <postalZipCode> contains the zip code for the business.

**Markup element:** <postalZipCode> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<postalZipCode>99999</postalZipCode>
```

2.5.2.5 City

**Description:** The element <city> contains the name of the city where the business is located.

**Markup element:** <city> (M)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<city>Happy Valley</city>
```

2.5.2.6 Country Code

**Description:** The element <country> contains the International Standards Organisation (ISO) country code where the business is located.

**Markup element:** <country> (M)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<country>UTOPIA</country>
```

2.5.2.7 State

**Description:** The element <state> contains the state where the business is located.

**Markup element:** <state> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<state>Euphoria</state>
```

2.5.2.8 Province

**Description:** The element <province> contains the province where the business is located.

**Markup element:** <province> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<province>Provincial</province>
```

2.5.2.9 Building identifier

**Description:** The element <building> contains the building number where the business is located.

**Markup element:** <building> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<building>11-22</building>
```

2.5.2.10 Room number

**Description:** The element <room> contains the room number in the building where the business is located.

**Markup element:** <room> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<room>99</room>
```

2.5.2.11 Phone numbers

**Description:** The element <phoneNumber> is repeatable and contains contact phone numbers for the business.

**Markup element:** <phoneNumber> (O)

**Attributes:**

– contactRole (O), containing whether this is the phone number for a primary, secondary or alternate contact.

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<phoneNumber contactRole="primary">111 222 333 444</phoneNumber>
```

2.5.2.12 FAX numbers

**Description:** The element <faxNumber> is repeatable and contains contact fax numbers for the business.

**Markup element:** <faxNumber> (O)

**Attributes:**

– contactRole (O), containing whether this is the fax number for a primary, secondary or alternate contact.

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<faxNumber>111 222 333 444</faxNumber>
```

2.5.2.13 Email addresses

**Description:** The element <email> is repeatable and contains contact fax numbers for the business.

**Markup element:** <email> (O)

**Attributes:**

– contactRole (O), containing whether this is the email address for a primary, secondary or alternate contact.

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<email>customers_services@utopia.com</email>
```

2.5.2.14 Internet addresses

**Description:** The element <internet> is repeatable and contains internet addresses for the business.

**Markup element:** <internet> (O)

**Attributes:**

– contactRole (O), containing whether this is the internet address for a primary, secondary or alternate contact.

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<internet>www.utopia.customers.services.online.com</internet>
```

2.5.2.15 SITA address

**Description:** The element <SITA> contains the address supplied in the aviation industry by SITA.

**Markup element:** <SITA> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<SITA>111.222.333.444</SITA>
```

**2.5.3 Contact persons**

**Description:** The element <contactPerson> is repeatable and contains all information related to individual contacts for a business unit.

**Markup element:** <contactPerson> (O)

**Attributes:**

– personPrefix (O), intended to capture information like Mr, Mrs, Ms, Dr etc

**Child elements:**

– <lastName> (M). Refer to Para 2.5.3.1.
– <middleName> (O). Refer to Para 2.5.3.2.
– <firstName> (O). Refer to Para 2.5.3.3.
– <jobTitle> (O). Refer to Para 2.5.3.4.
– <contactPersonAddress> (O). Refer to Para 2.5.3.5.

**Business rules decisions:**

– None identified

**Markup example:**

```
<contactPerson>
<lastName>Smiley</lastName>
</contactPerson>
```

2.5.3.1 Last name

**Description:** The element <lastName> contains the last name of the individual contact.

**Markup element:** <lastName> (M)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<lastName>Smiley</lastName>
```

2.5.3.2 Middle name

**Description:** The element <middleName> contains the middle name of the individual contact.

**Markup element:** <middleName> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<middleName>Quincy</middleName>
```

2.5.3.3 First name

**Description:** The element <firstName> contains the first name of the individual contact.

**Markup element:** <firstName> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<firstName>Jonathon</firstName>
```

2.5.3.4 Job title

**Description:** The element <jobTitle> contains the job title of the individual contact.

**Markup element:** <jobTitle> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<jobTitle>Morale Booster</jobTitle>
```

2.5.3.5 Contact person address

**Description:** The element <contactPersonAddress> contains the information required to identify the contact person.

**Markup element:** <contactPersonAddress> (O)

**Attributes:**

– id (O), the identifier of the <contactPersonAddress> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– <department> (O). Refer to Para 2.5.2.1.
– <street> (O). Refer to Para 2.5.2.2,
– <postOfficeBox> (O). Refer to Para 2.5.2.3.
– <postalZipCode> (O). Refer to Para 2.5.2.4.
– <city> (M). Refer to Para 2.5.2.5.
– <country> (M). Refer to Para 2.5.2.5.
– <state> (O). Refer to Para 2.5.2.7.
– <province> (O). Refer to Para 2.5.2.8.
– <building> (O). Refer to Para 2.5.2.9.
– <room> (O). Refer to Para 2.5.2.10.
– <phoneNumber> (O). Refer to Para 2.5.2.11.
– <faxNumber> (O). Refer to Para 2.5.2.12.
– <email> (O). Refer to Para 2.5.2.13.
– <internet> (O). Refer to Para 2.5.2.14.
– <SITA> (O). Refer to Para 2.5.2.15.

**Business rules decisions:**

– None identified

**Markup example:**

```
<contactPersonAddress>
<street>heaven street</street>
<postalZipCode>99999</postalZipCode><city>Saint Vitus</city>
<country>UTOPIA</country>
<phoneNumber>111 222 333 444</phoneNumber>

```

## 2.6 Enterprise references

**Description:** The element <enterpriseRef> is repeatable provides a method to refer other enterprises.

**Markup element:** <enterpriseRef> (O)

**Attributes:**

- enterpriseRefType (O), contains the type of enterprise reference.
- manufacturerCodeValue (M), containing the CAGE code of the enterprise being referenced.
- id (O), the identifier of the <enterpriseRef> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <dmRef> (O). Data module references must be populated in accordance with Chap 3.9.5.2.1.2.

**Business rules decisions:**

- None identified

**Markup example:**

```
<enterpriseRef manufacturerCodeValue="KZ444"/>
```

# 3 Project specific decisions

Project specific decisions include, but are not limited, to the following:

**Use of the enterprise technical information repository data module.** Project must decide if the enterprise technical information repository is to be used.

**Use of several enterprise technical repository data modules.** Project must decide whether to have one single enterprise technical information repository data module or several, depending of the SNS. In this case, granularity of these data modules is determined by the application of the SNS.

# 4 Examples

```
<techRepository>
<enterpriseRepository>
<enterpriseSpec id="C001">
<enterpriseIdent manufacturerCodeValue="KZ444"/>
<enterpriseName>UTOPIA plc</enterpriseName>

## 1 General

The technical information repository data module is used to capture and represent supplies intrinsic properties and related information.

The supplies properties identification can be used to uniquely identify the supplies products (such as oils, greases, paints) with their intrinsic properties which are always valid (eg the specification of the supply, its manufacturer, a flashpoint).

# 2 Supply technical repository data module content

## 2.1 Supply repository

**Description:** The element <`supplyRepository`> is used to provide a list of supplies and their associated properties.

**Markup element:** <`supplyRepository`> (M)

**Attributes:**

- `id` (O), the identifier of the <`supplyRepository`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <`supplySpec`> (M). Refer to Para 2.1.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of the supply technical repository data module or not
- use of a single or multiple supply repository data modules

**Markup example:**

```
<supplyRepository>
<supplySpec>...</supplySpec>
</supplyRepository>
```

### 2.1.1 Supply specification

**Description:** The element <`supplySpec`> represents a supply. It contains its associated properties.

**Markup element:** <`supplySpec`> (M)

**Attributes:**

- `hazardousFlag` (O), a flag to indicate that the supply is a hazardous product or not. This attribute can have one of the following values:
  - "`1`" (yes) for hazardous supplies
  - "`0`" (no) for non-hazardous supplies
- `obsoleteFlag` (O), a flag to indicate that the supply is obsolete or not. This attribute can have one of the following values:
  - "`1`" (yes) for obsolete supplies
  - "`0`" (no) for non-obsolete supplies
- `specialLabelFlag` (O), a flag to indicate that the supply product has a special labeling or not. This attribute can have one of the following values:
  - "`1`" (yes) for supplies with special labeling
  - "`0`" (no) for supplies without special labeling
- `id` (O), the identifier of the <`supplySpec`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.

**Child elements:**

- `<supplyIdent>` (M). Refer to Para 2.1.1.1.
- `<name>` (O). Refer to Para 2.1.1.2.
- `<shortName>` (O). Refer to Para 2.1.1.3.
- `<specificationGroup>` (O). Refer to Para 2.1.1.4.
- `<supplierGroup>` (M). Refer to Para 2.1.1.5.
- `<natoStockNumber>` (O). Refer to Chap 3.9.5.1.
- `<quantity>` (O), the supply flash point. Refer to Chap 3.9.5.2.1.10.
- `<refs>` (O). Refer to Chap 3.9.5.2.1.2.
- `<lowestAuthorizedLevelGroup>` (O). Refer to Para 2.1.1.6.

**Business rules decisions:**

- None identified

**Markup example:**

```
- <supplySpec>
  <supplyIdent ... />
<supplierGroup>...</supplierGroup>
</supplySpec>
```

2.1.1.1 Supply identifier

**Description:** Contrary to the attribute `id`, the element `<supplyIdent>` identifies semantically the supply as a result of its attributes.

**Markup element:** `<supplyIdent>` (M)

**Attributes:**

- `supplyNumber` (M), the supply number, which can be the supply trade name or a specification number
- `supplyNumberType` (M), indicates whether the supply number is a trade name or a specification. This attribute can have one of the following values:
  - "`comref`" for supply number corresponding to the supply trade name
  - "`spec`" when the supply number corresponds to a specification number
- `id` (O), the identifier of the `<supplyIdent>` element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- None

**Business rules decisions:**

– None identified

**Markup example:**

```
– <supplyIdent supplyNumber="JET A1"
  supplyNumberType="comref"/>
```

2.1.1.2 Supply name

**Description:** The element <name> contains the textual definition of the supply.

**Markup element:** <name> (M)

**Attributes:**

– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Definition of the supply name.

**Markup example:**

```
<name>FUEL TANK SEALANT POLYSULFIDE</name>
```

2.1.1.3 Supply short name

**Description:** The element <shortName> gives an abbreviated alternate name of the supply name corresponding to the element <name>. This short form for the name of the supply is meant to be presented in the narrative of the data module to make the reading easier.

**Markup element:** <shortName> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<shortName>SEALANT</shortName>
```

2.1.1.4 Specification list

**Description:** The element <specificationGroup> lists the specification that the supply meets.

**Markup element:** <specificationGroup> (O)

**Attributes:**

- `vendorFlag` (O), a flag to indicate if the list is defined by the Product manufacturer or by a supplier. This attribute can have one of the following values:
  - "`1`" for a list defined by the Product manufacturer
  - "`0`" for a list defined by a supplier
- `id` (O), the identifier of the <`specificationGroup`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <`specDocument`> (O). Refer to Para 2.1.1.4.1.

**Business rules decisions:**

- None identified

**Markup example:**

```
<specificationGroup>
<specDocument ... />
</specificationGroup>
```

*2.1.1.4.1 Specification document*

**Description:** The element <`specDocument`> is used to identify a specification document with which the supply complies.

**Markup element:** <`specDocument`> (M)

**Attributes:**

- `manufacturerCodeValue` (O), not used in the context of supplies
- `countryIsoCode` (O), the country of the specification owner
- `specDocumentNumber` (O), the identifier number of the specification
- `specDocumentType` (O), the type of the document, always a specification for supplies
- `id` (O), the identifier of the <`specDocument`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

```
<specDocument countryIsoCode="FR" specDocumentNumber="ASNA3572"
specDocumentType="specification"/>
```

2.1.1.5 Supplier list

**Description:** The element <supplierGroup> is used to specify the supply product list of suppliers.

**Markup element:** <supplierGroup> (M)

**Attributes:**

- id (O), the identifier of the <supplierGroup> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <suppliedBy> (M). Refer to Para 2.1.1.5.1.

**Business rules decisions:**

- None identified

**Markup example:**

```
<supplierGroup>
<suppliedBy ...>...</suppliedBy>
</supplierGroup>
```

*2.1.1.5.1 Supplier*

**Description:** The element <suppliedBy> is used to contain information about a supplier of the supply.

**Markup element:** <suppliedBy> (M)

**Attributes:**

- manufacturerCodeValue (O), the CAGE code of the product supplier
- locallySuppliedFlag (M), a flag to indicate if the supply can be locally purchased or not. This attribute can have one of the following values:
  - "1" (yes) for locally purchased parts
  - "0" (no) for non-locally purchased parts
- id (O), the identifier of the <suppliedBy> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <shippingInfo> (O). Refer to Para 2.1.1.5.2.

**Business rules decisions:**

- None identified

**Markup example:**

```
<suppliedBy manufacturerCodeValue="F8808"
locallySuppliedFlag="0"/>
```

*2.1.1.5.2 Shipping information*

**Description:** The element <shippingInfo> contains the shipping information for the supply if any. They are divided into fours types of information.

**Markup element:** <shippingInfo> (O)

**Attributes:**

- id (O), the identifier of the <shippingInfo> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11

**Child elements:**

One of the children has to be populated at least:

- <packaging> (O). Refer to Para 2.1.1.5.3.
- <transport> (O). Refer to Para 2.1.1.5.4.
- <shelfLife> (O). Refer to Para 2.1.1.5.5.
- <simpleRemark> (O). Refer to Para 2.1.1.5.6.

**Business rules decisions:**

- None identified

**Markup example:**

```
<shippingInfo>
<packaging>...</packaging>
</shippingInfo>
```

*2.1.1.5.3 Packaging*

**Description:** The element <packaging> contains information about the packaging of the supply.

**Markup element:** <packaging> (O)

**Attributes:**

- id (O), the identifier of the <packaging> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<packaging>1 AND 20 LITER (0.265 AND 5.3 GAL) CAN</packaging>
```

*2.1.1.5.4 Transport*

**Description:** The element <transport> contains information about the transport of the supply.

**Markup element:** <transport> (O)

**Attributes:**

– id (O), the identifier of the <transport> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<transport>FLAMMABLE LIQUID</transport>
```

*2.1.1.5.5 Shelf life*

**Description:** The element <shelfLife> contains information about the shelf life of the supply.

**Markup element:** <shelfLife> (O)

**Attributes:**

– id (O), the identifier of the <shelfLife> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<shelfLife>APPROX 4 YEARS AT 20 DEG C (68 DEG F)</shelfLife>
```

*2.1.1.5.6 General remark*

**Description:** The element <simpleRemark> contains general remarks about the shipping information related to the supply.

**Markup element:** <simpleRemark> (O)

**Attributes:**

- id (O), the identifier of the <simpleRemark> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

```
<simpleRemark>FLAMMABLE,BUT DOES NOT REQUIRE A HAZARD
SYMBOL</simpleRemark>
```

2.1.1.6 Lowest authorized maintenance level group

**Description:** The element <lowestAuthorizedLevelGroup> contains groups the different lowest authorized maintenance levels associated to the supply.

**Markup element:** <lowestAuthorizedLevelGroup> (O)

**Attributes:**

- None

**Child elements:**

- <lowestAuthorizedLevel> (M). Refer to Para 2.1.1.6.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use of the lowest authorized maintenance level or not.

**Markup example:**

```
<lowestAuthorizedLevelGroup>
<lowestAuthorizedLevel .../>
</lowestAuthorizedLevelGroup>
```

*2.1.1.6.1 Lowest authorized maintenance level*

**Description:** The element <lowestAuthorizedLevel> indicates the minimum skill authorized to remove, replace, or use an item. The use of this element will facilitate supplying the bench stock applicable to the maintainer's skill level without having to go through an entire

manual to determine what consumable supplies might be needed. It also alerts the clerk in the supply room of which supplies the maintainer is allowed to acquire for bench stock.

**Markup element:** <`lowestAuthorizedLevel`> (O)

**Attributes:**

– `lowestLevel` (M), the lowest authorized level value. This attribute can have the following values:
  - "`la01`" - "`la99`", refer to Chap 3.9.6.1

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Definition of the attribute `lowestLevel` enumerated values.

**Markup example:**

```
<lowestAuthorizedLevel lowestLevel="la01"/>
```

# 3 Business rules decisions

Business rules decisions include, but are not limited, to the following:

**Use of the supplies properties technical information repository data modules.** The project or the organization must decide if the supplies properties technical information repository must be used or not. Use of this technical information repository data module can be considered as an alternative to the material data modules described in Chap 5.2.1.17 and Para 2.

**Use of several supplies properties technical information repository data modules.** The project must decide whether there is one single or several supply intrinsic properties technical repository data module depending of the SNS. In this case, granularity of these data modules is determined by the application of the SNS. Refer to Para 2.

**Definition of the supply name.** The project or the organization must decide on the format of the supply name and apply these rules consistently in the project. This includes the case of the names and the source from which they are derived. Refer to Para 2.1.1.2.

**Lowest authorized level**. The project or the organization must decide on the use of lowest authorized level or not. If used, the project or the organization must determine how to populate the enumerated attribute `lowestLevel`. Refer to Para 2.1.1.6.

# 4 Examples

This example shows the combined use of the supply intrinsic properties technical information repository and the supply requirement technical information repository.

The following example illustrates supply intrinsic properties technical information repository. It defines two supplies and related properties.

```
<techRepository>
<supplyRepository>
<supplySpec id="ENBSB-DUROFIX_FIXATIF_UW_SPECIAL">
<supplyIdent supplyNumber="BSB-DUROFIX_FIXATIF_UW_SPECIAL"
supplyNumberType="comref"/>
<specificationGroup vendorFlag="0">
```

```
<specDocument countryIsoCode="FR"
specDocumentNumber="IPDA 28-05"/>
</specificationGroup>
<supplierGroup>
<suppliedBy locallySuppliedFlag="0"
manufacturerCodeValue="F8808">
<shippingInfo>
<packaging>1 AND 20 LITER (0.265 AND 5.3 GAL) CAN</packaging>
<shelfLife>APPROX 4 YEARS AT 20 DEG C (68 DEG F)</shelfLife>
<transport>FLAMMABLE LIQUID</transport>
</shippingInfo>
</suppliedBy>
</supplierGroup>
</supplySpec>
<supplySpec id="ENBSB-DUROFIX_FIXATIF_UW">
<supplyIdent supplyNumber="BSB-DUROFIX_FIXATIF_UW"
supplyNumberType="comref"/>
<specificationGroup vendorFlag="0">
<specDocument countryIsoCode="FR"
specDocumentNumber="ASNA3572"/>
</specificationGroup>
<supplierGroup>
<suppliedBy locallySuppliedFlag="0"
manufacturerCodeValue="F8808">
<shippingInfo>
<packaging>1 AND 20 LITER (0.265 AND 5.3 GAL) CAN</packaging>
<shelfLife>APPROX 4 YEARS AT 20 DEG C (68 DEG F)</shelfLife>
<transport>FLAMMABLE LIQUID</transport>
</shippingInfo>
</suppliedBy>
</supplierGroup>
</supplySpec>
</supplyRepository>
</techRepository>
```

The following example illustrates supply requirement technical information repository. Defined supplies (see above) are targeted through the use of the element <`supplyRef`> with attribute `supplyNumber` properly filled.

```
<techRepository>
<supplyRqmtRepository>
<supplyRqmtSpec id="inv0105029-">
<supplyRqmtIdent materialCategory="05" supplyRqmtNumber="029"/>
<supplyRqmtAlt id="sol0105029">
<supplyRqmtAltIdent materialCategory="05" supplyRqmtNumber="029"
vendorFlag="0"/>
<supplySetGroup>
<supplySet>
<supplyRef supplyNumber="BSB-DUROFIX_FIXATIF_UW_SPECIAL"
supplyNumberType="comref"/>
<supplyRef supplyNumber="BSB-DUROFIX_FIXATIF_UW"
supplyNumberType="comref"/>
</supplySet>
```

```
</supplySetGroup>
<name>FIXATIVE FOR PLACARD INSTALLATION</name>
<safetyCategory safetyCategoryValue="C"/>
<usage>IMMERSION OF BSB LABEL</usage>
</supplyRqmtAlt>
</supplyRqmtSpec>
</supplyRqmtRepository>
</techRepository>
```

## 1 General

The technical information repository data module is used to capture and represent supplies requirements and use conditions.

The supplies requirements identification can be used to uniquely identify the supplies use conditions (eg in which case a supply or a group of supplies can be used).

## 2 Supply requirements technical repository data module content

### 2.1 Supply requirement repository

**Description:** The element <`supplyRqmtRepository`> is used to provide a list of supply requirements and their associated properties.

**Markup element:** <`supplyRqmtRepository`> (M)

**Attributes:**

- `id` (O), the identifier of the <`supplyRqmtRepository`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <`supplyRqmtSpec`> (M). Refer to Para 2.1.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of the supply requirement technical repository data module or not
- use of a single or multiple supply requirement repository data modules

**Markup example:**

```
<supplyRqmtRepository>
<supplyRqmtSpec>...</supplyRqmtSpec>
</supplyRqmtRepository>
```

### 2.1.1 Supply requirement specification

**Description:** The element <`supplyRqmtSpec`> represents one supply requirement. It contains its associated properties.

**Markup element:** <`supplyRqmtSpec`> (M)

**Attributes:**

- `id` (O), the identifier of the <`supplyRqmtSpec`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11

**Child elements:**

- <`supplyRqmtIdent`> (M). Refer to Para 2.1.1.1.
- <`supplyRqmtAlt`> (M). Refer to Para 2.1.1.2.
- <`refs`> (O). Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

- None identified

**Markup example:**

```
- <supplyRqmtSpec>
  <supplyRqmtIdent .../>
```

```
<supplyRqmtAlt>...</supplyRqmtAlt>
</supplyRqmtSpec>
```

2.1.1.1 Supply requirement identifier

**Description:** Contrary to the attribute `id`, the element <`supplyRqmtIdent`> identifies semantically the supply requirement as a result of its attributes.

**Markup element:** <`supplyRqmtIdent`> (M)

**Attributes:**

- `materialCategory` (M), the nature of use of the supply requirement (eg fuel, cleaning agent, lubricant...)
- `supplyRqmtNumber` (M), the supply requirement number.
- `vendorFlag` (O), a flag to indicate if the supply requirement is defined by the Product manufacturer, value "`0`" (no), or by a supplier, value "`1`" (yes)
- `id` (O), the identifier of the <`supplyRqmtIdent`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Definition of the material categories.
- Definition of the supply requirement numbers.

**Markup example:**

- ```
  <supplyRqmtIdent materialCategory="09"
  supplyRqmtNumber="09-001"/>
  ```

2.1.1.2 Alternatives of the supply requirement

**Description:** The element <`supplyRqmtAlt`> represents one alternative of the supply requirement. Each alternative lists one or several supplies that fulfill the supply requirement.

**Markup element:** <`supplyRqmtAlt`> (M)

**Attributes:**

- `supplyRqmtType` (O), the type of the supply requirement alternative
- `applicRefId` (O), the applicability information. Refer to Chap 3.9.5.3.
- `id` (O), the identifier of the <`supplyRqmtAlt`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
  ```

**Child elements:**

- <supplyRqmtAltIdent> (M). Refer to Para 2.1.1.2.1.
- <supplySetGroup> (M). Refer to Para 2.1.1.2.2.
- <name> (M). Refer to Para 2.1.1.2.5.
- <shortName> (O). Refer to Para 2.1.1.2.6.
- <safetyCategory> (O). Refer to Para 2.1.1.2.7.
- <usage> (O). Refer to Para 2.1.1.2.8.
- <rcmd> (O). Refer to Para 2.1.1.2.9.
- <refs> (O). Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

- None identified

**Markup example:**

```
<supplyRqmtAlt>
<supplyRqmtAltIdent .../>
<supplySetGroup>...</supplySetGroup>
<name>...</name>
</supplyRqmtAlt>
```

*2.1.1.2.1 Alternate supply item identifier*

**Description:** Contrary to the attribute id, the element <supplyRqmtAltIdent> identifies semantically the supply requirement as a result of its attributes.

**Markup element:** <supplyRqmtAltIdent> (M)

**Attributes:**

- materialCategory (M), the nature of use of the supply requirement alternative (eg fuel, cleaning agent, lubricant).
- supplyRqmtNumber (M), the supply requirement alternative number.
- vendorFlag (O), a flag to indicate if the supply requirement alternative is defined by the Product manufacturer, value "0" (no), or by a supplier, value "1" (yes).
- id (O), the identifier of the <supplyRqmtAltIdent> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- definition of the material categories.
- definition of the supply requirement numbers.

**Markup example:**

```
<supplyRqmtAltIdent materialCategory="09"
supplyRqmtNumber="09-001A"/>
```

*2.1.1.2.2 Supplies*

**Description:** The element <supplySetGroup> is constituted of supplies and/or sets of supplies. Each supply or set of supplies can be used equally.

**Markup element:** <supplySetGroup> (M)

**Attributes:**

- id (O), the identifier of the <supplySetGroup> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

At least, one of the following elements has to be used:

- <supplySet> (O). Refer to Para 2.1.1.2.3.
- <supplyRef> (O). Refer to Para 2.1.1.2.4.

**Business rules decisions:**

- None identified

**Markup example:**

```
<supplySetGroup>
<supplyRef .../>
</supplySetGroup>
```

*2.1.1.2.3 Supply set*

**Description:** The element <supplySet> identifies supplies that have to be used together (eg base and primer supply).

**Markup element:** <supplySet> (O)

**Attributes:**

- id (O), the identifier of the <supplySet> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <supplyRef> (M). Refer to Para 2.1.1.2.4.

**Business rules decisions:**

- None identified

**Markup example:**

```
<supplySet>
<supplyRef .../>
<supplyRef .../>
</supplySet>
```

*2.1.1.2.4 Supply*

**Description:** The element <supplyRef> represents a supply and also allows referring to its definition in the supply technical repository.

**Markup element:** <supplyRef> (O)

**Attributes:**

- supplyNumber (M), the supply number, which can be the supply trade name or a specification number
- supplyNumberType (M), indicates whether the supply number is a trade name or a specification. This attribute can have one of the following values:
  - "comref" for supply number corresponding to the supply trade name
  - "spec" when the supply number corresponds to a specification number
- id (O), the identifier of the <supplyRef> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <refs> (O), used to explicitly reference the supply in the supply technical repository. For implicit reference, the supply semantic identifiers (supply number and supply number type) are sufficient. Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use explicit or implicit reference mechanism to the supply technical repository

**Markup example:**

```
<supplyRef supplyNumber="JET A1" supplyNumberType="comref"/>
```

*2.1.1.2.5 Supply requirement alternative name*

**Description:** The element <name> contains the textual definition of the supply requirement alternative.

**Markup element:** <name> (O)

**Attributes:**

- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- definition of the supply requirement name.

**Markup example:**

```
<name>FIXATIVE FOR PLACARD INSTALLATION</name>
```

2.1.1.2.6 *Supply requirement alternative short designation*

**Description:** The element <shortName> gives an abbreviated alternate name of the supply requirement alternative designation corresponding to the element <name>. This short form for the name of the supply requirement alternative designation is meant to be presented in the narrative of the data module to make the reading easier.

**Markup element:** <shortName> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<shortName>FIXATIVE</shortName>
```

2.1.1.2.7 *Category*

**Description:** The element <safetyCategory> is used to specify, through its attribute, the safety category of the supply listed in the supply requirement alternative.

**Markup element:** <safetyCategory> (O)

**Attributes:**

– safetyCategoryValue (M), specifies the supply requirement safety category. This attribute can have one of the following values:
  - "A" for supply requirement alternatives mandatory for safety reasons
  - "B" for recommended supply requirement alternatives
  - "C" for commonly supply requirement alternatives
– id (O), the identifier of the <safetyCategory> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<safetyCategory safetyCategoryValue="A"/>
```

2.1.1.2.8 *Usage*

**Description:** The element <usage> contains the supply requirement alternative usage description.

**Markup element:** <usage> (O)

**Attributes:**

- `id` (O), the identifier of the <`usage`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

```
<usage>IMMERSION OF BSB LABEL</usage>
```

*2.1.1.2.9 Recommendation*

**Description:** The element <`rcmd`> contains the recommendations linked to the supply requirement alternative.

**Markup element:** <`rcmd`> (O)

**Attributes:**

- `id` (O), the identifier of the <`rcmd`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

```
<rcmd>REFER TO THE ENGINE MANUFACTURERS DATA FOR APPROVED FUEL
ADDITIVES</rcmd>
```

# 3 Business rules decisions

Business rules decisions include, but are not limited, to the following:

**Use of the supplies requirements technical information repository data modules.** The project or the organization must decide if the supplies requirements technical information repository must be used or not. Refer to Para 2.

**Use of several supplies requirements technical information repository data modules.** The project or the organization must decide whether there is one single or several supplies requirements technical repository data module depending of the SNS. In this case, granularity of these data modules is determined by the application of the SNS. Refer to Para 2.

**Definition of the material categories.** The project or the organization must define the different material categories and how to populate the attribute `materialCategory`. Refer to Para 2.1.1.1.

**Definition of the supply requirement numbers.** The project or the organization must define the codification of the supply requirement identifiers and how to populate the attributes `supplyReqNumber`. Refer to Para 2.1.1.1.

**Reference mechanism.** The project or the organization must decide whether to use the implicit or explicit reference mechanism to the supply technical repository. Refer to Chap 4.13.2 for details on the two reference mechanisms. Refer to Para 2.1.1.2.1.

**Definition of the supply requirement alternative name.** The project or the organization must decide on the format of the supply requirement alternative name and apply these rules consistently in the project. This includes the case of the names and the source from which they are derived. Refer to Para 2.1.1.2.5.

# 4 Examples

This example shows the combined use of the supply intrinsic properties technical information repository and the supply requirement technical information repository.

The following example illustrates supply intrinsic properties technical information repository. It defines two supplies and related properties.

```
<techRepository>
<supplyRepository>
<supplySpec id="ENBSB-DUROFIX_FIXATIF_UW_SPECIAL">
<supplyIdent supplyNumber="BSB-DUROFIX_FIXATIF_UW_SPECIAL"
supplyNumberType="comref"/>
<specificationGroup vendorFlag="0">
<specDocument countryIsoCode="FR"
specDocumentNumber="IPDA 28-05"/>
</specificationGroup>
<supplierGroup>
<suppliedBy locallySuppliedFlag="0"
manufacturerCodeValue="F8808">
<shippingInfo>
<packaging>1 AND 20 LITER (0.265 AND 5.3 GAL) CAN</packaging>
<shelfLife>APPROX 4 YEARS AT 20 DEG C (68 DEG F)</shelfLife>
<transport>FLAMMABLE LIQUID</transport>
</shippingInfo>
</suppliedBy>
</supplierGroup>
</supplySpec>
<supplySpec id="ENBSB-DUROFIX_FIXATIF_UW">
<supplyIdent supplyNumber="BSB-DUROFIX_FIXATIF_UW"
supplyNumberType="comref"/>
<specificationGroup vendorFlag="0">
<specDocument countryIsoCode="FR"
specDocumentNumber="ASNA3572"/>
</specificationGroup>
<supplierGroup>
<suppliedBy locallySuppliedFlag="0"
manufacturerCodeValue="F8808">
<shippingInfo>
```

```
<packaging>1 AND 20 LITER (0.265 AND 5.3 GAL) CAN</packaging>
<shelfLife>APPROX 4 YEARS AT 20 DEG C (68 DEG F)</shelfLife>
<transport>FLAMMABLE LIQUID</transport>
</shippingInfo>
</suppliedBy>
</supplierGroup>
</supplySpec>
</supplyRepository>
</techRepository>
```

The following example illustrates supply requirement technical information repository. Defined supplies are targeted through the use of the element `<supplyRef>` with attribute `supplyNumber` properly filled

```
<techRepository>
<supplyRqmtRepository>
<supplyRqmtSpec id="inv0105029-">
<supplyRqmtIdent materialCategory="05" supplyRqmtNumber="029"/>
<supplyRqmtAlt id="sol0105029">
<supplyRqmtAltIdent materialCategory="05" supplyRqmtNumber="029"
vendorFlag="0"/>
<supplySetGroup>
<supplySet>
<supplyRef supplyNumber="BSB-DUROFIX_FIXATIF_UW_SPECIAL"
supplyNumberType="comref"/>
<supplyRef supplyNumber="BSB-DUROFIX_FIXATIF_UW"
supplyNumberType="comref"/>
</supplySet>
</supplySetGroup>
<name>FIXATIVE FOR PLACARD INSTALLATION</name>
<safetyCategory safetyCategoryValue="C"/>
<usage>IMMERSION OF BSB LABEL</usage>
</supplyRqmtAlt>
</supplyRqmtSpec>
</supplyRqmtRepository>
</techRepository>
```

# 1 General

The technical information repository data module Schema is used to capture and represent tools and their associated properties.

The support equipment identification can be used to uniquely identify any support equipment, including standard and special tools required to correctly accomplish a given action, task or procedure, using the element <toolRef>. Refer to Chap 3.9.5.2.1.9.

# 2 Tools technical repository data module content

## 2.1 Tool repository

**Description:** The element <toolRepository> is used to provide a list of parts and their associated properties.

**Markup element:** <toolRepository> (M)

**Attributes:**

- id (O), the identifier of the <toolRepository> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <figure> (O), tool illustrations. Refer to Chap 3.9.5.2.1.7
- <toolSpec> (M). Refer to Para 2.1.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use of the tool technical repository data module or not.
- Use of a single or multiple tool repository data modules.

**Markup example:**

```
<toolRepository>
<toolSpec>...</toolSpec>
</toolRepository>
```

### 2.1.1 Tool specification

**Description:** The element <toolSpec> represents a tool. It contains its associated properties.

The tool has a container-alternate structure. Indeed, some of its properties are generic: they do not differ from a product instance to another. Some other properties depend on the product configuration. Generic properties are directly defined under the tool (container level), other properties are defined under the alternate tools. For some properties appearing both at container and alternate levels, the following rule must be applied: if the property is fulfilled in the alternate element, it supersedes for the specific configuration under which it applies, the generic value stored in the container element.

Following container/alternate principles, data modules only refer to containers. Retrieval of the accurate alternate is achieved using applicability annotations.

Refer to Chap 4.13.3 for detail explanation of the container concept.

**Markup element:** <toolSpec> (M)

**Attributes:**

- id (O), the identifier of the <toolSpec> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.

**Child elements:**

- <toolIdent> (M). Refer to Para 2.1.1.1.
- <itemIdentData> (M). Refer to Chap 3.9.5.2.11.3.
- <procurementData> (M). Refer to Chap 3.9.5.2.11.3.
- <techData> (M). Refer to Para 2.1.1.2.
- <toolRefGroup> (O). Refer to Para 2.1.1.3.
- <toolAlt> (M). Refer to Para 2.1.1.4.
- <refs> (O). Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

- None identified

**Markup example:**

```
- <toolSpec>
  <toolIdent .../>
- <itemIdentData>...</itemIdentData>
- <procurementData>...</procurementData>
- <techData>...</techData>
- <toolAlt>...</toolAlt>
  </toolSpec>
```

2.1.1.1 Tool identifier

**Description:** Contrarily to the id attribute, the element <toolIdent> identifies semantically the tool thanks to its attributes.

**Markup element:** <toolIdent> (M)

**Attributes:**

- toolNumber (M), the tool part number.
- manufacturerCodeValue (M), the CAGE/CAGE code of the tool part manufacturer. As there is no standardized rule to assign a part number, the CAGE/CAGE code of the part manufacturer ensures the uniqueness of a part number.
- id (O), the identifier of the <toolIdent> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<toolIdent toolNumber="0-0204504-1"
manufacturerCodeValue="F0286"/>
```

2.1.1.2 Technical data

**Description:** The element <`techData`> groups the technical properties related to the tool as a part.

**Markup element:** <`techData`> (M)

**Attributes:**

– `etopsFlag` (O), not used in this context, because this attribute property is specific to parts
– `hazardousFlag` (O), a flag to indicate that the part is a hazardous product or not. This attribute can have one of the following values:
  - "`1`" (yes) for hazardous parts
  - "`0`" (no) for non-hazardous parts
– `id` (O), the identifier of the <`techData`> element. Refer to Chap 3.9.5.2.1.2.
– `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– <`sparePartClass`> (O). Refer to Chap 3.9.5.2.1.3.
– <`usageCategory`> (O). Refer to Chap 3.9.5.2.1.3.
– <`specDocument`> (O). Refer to Chap 3.9.5.2.1.3.
– <`quantity`> (O), the dimensions of the tool. Refer to Chap 3.9.5.2.1.10.
– <`physicalSecurityPilferageCode`> (O). Refer to Chap 3.9.5.2.7.
– <`fitmentCode`> (O). Refer to Chap 3.9.5.2.7.
– <`unitOfIssue`> (O). Refer to Chap 3.9.5.2.7.
– <`specialStorage`> (O). Refer to Chap 3.9.5.2.7.
– <`calibrationMarker`> (O). Refer to Chap 3.9.5.2.7.

**Business rules decisions:**

– None identified

**Markup example:**

```
<techData>...</techData>
```

2.1.1.3 Relationships with others tools

**Description:** The element <`toolRefGroup`> allows providing relationships and the type of relationship with other tools.

**Markup element:** <toolRefGroup> (O)

**Attributes:**

- toolRefType (M), the type of the relationship between the tools (eg symmetry, replacement relationship).
- id (O), the identifier of the <toolRefGroup> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <toolRef> (M). The referenced tool. The target is always a tool container. Refer to Chap 3.9.5.2.1.9.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Definition of the tool relationship types.

**Markup example:**

```
<toolRefGroup zoneRefType="symmetric">
<toolRef .../>
</toolRefGroup>
```

2.1.1.4 Alternate tool

**Description:** The element <toolAlt> contains the properties of the tool that depend on the Product configuration. Thus this element contains applicability.

Configuration consistency between the various alternate tools must be ensured. It means that for a given product configuration and under given operational conditions, only one alternate tool is applicable at one time for a container tool.

**Markup element:** <toolAlt> (M)

**Attributes:**

- altNumber (O), the alternate number.
- deliveredSpecificationFlag (O), indicates delivery of a specification sheet with the support equipment
- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
- id (O), the identifier of the <toolAlt> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <itemDescr> (M). Refer to Chap 3.9.5.2.11.4.

- <functionalPhysicalAreaRef> (O). Refer to Chap 3.9.5.2.11.10.
- <rcmdQuantity> (O). Refer to Para 2.1.1.4.1.
- <packaging> (O). Refer to Chap 3.9.5.2.11.7.
- <taskCategory> (O). Refer to Para 2.1.1.4.2.
- <simpleRemark> (O). Refer to Chap 3.9.5.2.11.7.
- <internalRef> (O), reference to the illustration where the zone is illustrated. Refer to Chap 3.9.5.2.1.2.
- <refs> (O). Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use of an alternate number.

**Markup example:**

```
<toolAlt applicRefId="applic-001">
<itemDescr>...</itemDescr>
</toolAlt>
```

*2.1.1.4.1 Recommended quantity*

**Description:** The element <rcmdQuantity> contains the tool recommended quantity.

**Markup element:** <rcmdQuantity> (O)

**Attributes:**

- id (O), the identifier of the <rcmdQuantity> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

```
<rcmdQuantity>2</rcmdQuantity>
```

*2.1.1.4.2 Task code*

**Description:** The element <taskCategory> is used to specify the usage of the tool (eg servicing, maintenance, overhaul, repair etc). This is done through its attribute.

**Markup element:** <taskCategory> (O)

**Attributes:**

- taskCategoryCode (M), the tool task category value.
- id (O), the identifier of the <taskCategory> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

– `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the tool task code.

**Markup example:**

```
<taskCategory taskCategoryCode="maintenance"/>
```

# 3 Business rules decisions

Business rules decisions include, but are not limited, to the following:

**Use of the support equipment technical information repository data modules.** The project or the organization must decide if the support equipment technical information repository must be used or not. Refer to Para 2.

**Use of several support equipment technical information repository data modules.** The project or the organization must decide whether there is one single support equipment technical information repository data module or several depending of the SNS. In this case, granularity of these data modules is determined by the application of the SNS. Refer to Para 2.

**Use of the over length support equipment number element** `<overLengthPartNumber>`**.** The project or the organization must decide whether they use or not the over length part number. Refer to Para 2.1.

**Definition of the tool relationship types.** The project or the organization must define the types of relationships to be implemented between tools (eg symmetry, replacement relationships) and how to populate the attribute `toolRefType`. Refer to Para 2.1.1.3.

**Use of an alternate number.** The project or the organization must decide on the use of an alternate number or not. If used, the project or the organization must determine how to populate the attribute `altNumber` and must ensure it is consistently applied. Refer to Para 2.1.1.4.

**Use of the tool task category.** The project or the organization must decide on the use of a tool task category (eg servicing, maintenance, overhaul, repair etc) or not. If used, the project or the organization must determine how to populate the attribute `taskCategoryCode`. Refer to Para 2.1.1.4.2.

## 1 General

The technical information repository data module is used to capture and represent the functional and/or physical breakdown. The functional and/or physical breakdown is the collection of functional and/or physical areas with their properties and the relationships between them.

There are six types of functional and/or physical areas that describe a Product They are the systems, the subsystems, the sub-subsystems, the assemblies, the disassemblies and the disassembly variants. The systems and subsystems are defined in the S1000D specification (Refer to Chap 8.2), whereas the sub-subsystems, assemblies, disassemblies and disassembly variants are allocated by the data owner.

# 2 Functional and/or physical area technical repository data module content

## 2.1 Functional and/or physical repository

**Description:** The element <functionalPhysicalAreaRepository> is used to provide a list of functional and/or physical areas and their associated properties.

**Markup element:** <functionalPhysicalAreaRepository> (M)

**Attributes:**

– None

**Child elements:**

– <functionalPhysicalAreaSpec> (M). Refer to Para 2.1.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– use of the functional and/or physical areas technical repository data module or not
– use of a single or multiple functional and/or physical areas repository data modules

**Markup example:**

```
<functionalPhysicalAreaRepository>
<functionalPhysicalAreaSpec>...</functionalPhysicalAreaSpec>
</functionalPhysicalAreaRepository>
```

### 2.1.1 Functional and/or physical area specification

**Description:** This element represents one functional and/or physical area and its properties.

There are six types of functional and/or physical areas: the systems, the subsystems, the sub-subsystems, the assemblies, the disassemblies and the disassembly variants.

A given functional and/or physical area may not be valid for all the product instances of the CSDB. As a result, a functional and/or physical area can have applicability.

**Markup element:** <functionalPhysicalAreaSpec> (M)

**Attributes:**

– id (O), the identifier of the <functionalPhysicalAreaSpec> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.
– applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.

**Child elements:**

– <functionalPhysicalAreaIdent> (M). Refer to Para 2.1.1.1.
– <name> (O). Refer to Para 2.1.1.2.
– <shortName> (O). Refer to Para 2.1.1.3.
– <functionalPhysicalAreaRefGroup> (O). Refer to Para 2.1.1.4.

**Business rules decisions:**

- None identified

**Markup example:**

```
<functionalPhysicalAreaSpec>
<functionalPhysicalAreaIdent .../>
</functionalPhysicalAreaSpec>
```

2.1.1.1 Functional and/or physical area identifier

**Description:** Contrary to the attribute `id`, the element `<functionalPhysicalAreaIdent>` identifies semantically the functional and/or physical area as a result of its attributes. In addition to the functional and/or physical area identifier, the system difference code can be specified for each functional and/or physical area.

**Markup element:** <functionalPhysicalAreaIdent> (M)

**Attributes:**

- `systemDiffCode` (O), to indicate to which system difference code the functional and/or physical area pertains to. Refer to Chap 3.9.5.1.
- `systemCode` (M), the functional and/or physical area system code. Refer to Chap 3.9.5.1.
- `subSystemCode` (M), the functional and/or physical area subsystem code. Refer to Chap 3.9.5.1.
- `sub-subsystemCode` (M), the functional and/or physical area sub-subsystem code. Refer to Chap 3.9.5.1.
- `assyCode` (M), the functional and/or physical area assembly code.. Refer to Chap 3.9.5.1.
- `disassyCode` (O), the functional and/or physical area disassembly code. Refer to Chap 3.9.5.1.
- `disassyCodeVariant` (O), the functional and/or physical area disassembly code variant. Refer to Chap 3.9.5.1.

**Child elements:**

- None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use of the disassembly code and disassembly code variant
- use of system difference code

**Markup example:**

The subsystem 21-1 must be populated:

```
<functionalPhysicalAreaIdent systemCode="21" subSystemCode="1"
subSubSystemCode="0" assyCode="00"/>
```

In case of project managing the disassembly in the functional and/or physical area repository, the disassembly 21-11-32-02 must be populated:

```
<functionalPhysicalAreaIdent systemCode="21" subSystemCode="1"
subSubSystemCode="1" assyCode="32" disassyCode="02"/>
```

In case of project managing several system difference code, the system difference code value to which the functional area pertains to must to be indicated. The subsystem 21-1 in system difference code A must be populated:

```
<functionalPhysicalAreaIdent systemDiffCode="A" systemCode="21"
subSystemCode="1" subSubSystemCode="0" assyCode="00"/>
```

2.1.1.2 Functional and/or physical area designation

**Description:** The element <name> contains the long definition of the functional and /or physical area.

For systems and subsystems, this description has to follow the S1000D specification. Refer to Chap 8.2.

For sub-subsystems and assemblies, this description is defined by the data owner.

**Markup element:** <name> (O)

**Attributes:**

– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

**Child elements:**

– None

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Definition of the functional and/or physical area name from the sub-subsystem level.

**Markup example:**

```
<name>Those units and components which provide air
vehicle navigational information. Includes VOR,
pitot, static, ILS, flight director, compasses,
indicators, etc.</name>
```

2.1.1.3 Functional and/or physical area short designation

**Description:** The element <shortName> contains the short definition of the functional and /or physical area.

For systems and subsystems, this description has to follow the S1000D specification. Refer to Chap 8.2.

For sub- subsystems and assemblies, this description is defined by the data owner.

**Markup element:** <shortName> (O)

**Attributes:**

– None

**Child elements:**

– None

**Business rules decisions:**

– None identified

**Markup example:**

```
<shortName>Navigation</shortName>
```

2.1.1.4 References to other functional and/or physical areas

**Description:** The element <functionalPhysicalAreaRefGroup> allows reflecting the functional and/or physical breakdown. If used, it must only contain the links from a functional and/or physical area to its direct children.

This means that a system can only refer to subsystems with the same system code values, a subsystem can only refer to sub-subsystems with the same system and subsystem code values, etc.

**Markup element:** <functionalPhysicalAreaRefGroup> (O)

**Attributes:**

– None

**Child elements:**

– <functionalPhysicalAreaRef> (M). Refer to Para 2.1.1.5.

**Business rules decisions:**

– None identified

**Markup example:**

```
<functionalPhysicalAreaRefGroup>
<functionalItemRef .../>
</functionalPhysicalAreaRefGroup>
```

2.1.1.5 Functional and/or physical area

**Description:** The element <functionalPhysicalAreaRef> is used to markup a functional and/or physical area (outside of its specification in the functional and/or physical area technical repository) and also allows referring to its specification in the functional and/or physical area technical repository.

**Markup element:** <functionalPhysicalAreaRef> (M)

**Attributes:**

– systemDiffCode (O), to indicate to which system difference code the functional and/or physical area pertains to. Refer to Chap 3.9.5.1.
– systemCode (M), the functional and/or physical area system code. Refer to Chap 3.9.5.1.
– subSystemCode (M), the functional and/or physical area subsystem code. Refer to Chap 3.9.5.1.
– sub-subsystemCode (M), the functional and/or physical area sub- subsystem code. Refer to Chap 3.9.5.1.
– assyCode (M), the functional and/or physical area assembly code.. Refer to Chap 3.9.5.1.
– disassyCode (O), the functional and/or physical area disassembly code. Refer to Chap 3.9.5.1.
– disassyCodeVariant (O), the functional and/or physical area disassembly code variant. Refer to Chap 3.9.5.1.
– id (O), the identifier of the <functionalItemRef> element. Refer to Chap 3.9.5.2.1.2.

- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- `<dmRef>` (O). Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- use explicit or implicit reference mechanism to the functional and/or physical area technical repository

**Markup example:**

```
<functionalPhysicalAreaRef systemCode="21" subSystemCode="1"
sub-subsystemCode="0" assyCode="00"/>
```

# 3 Business rules decisions

Business rules decisions include, but are not limited, to the following:

**Use of the functional and/or physical area technical information repository data modules.** The project or the organization must decide if the functional and/or physical area technical repository must be used or not. Refer to Para 2.

**Use of several functional and/or physical area technical information repository data modules.** The project or the organization must decide whether there is one single functional and/or physical area technical repository data module or several. The decision can occur in the case of multi-partner CSDB. Indeed for multi-partner CSDB, each partner is allowed to maintain and exchange its own functional and/or physical area technical information repository data module. It is also the case for CSDB managing several system difference codes. The project or the organization must decide whether to have one or several functional and/or physical technical repositories (one per system difference code). Refer to Para 2.

**Consistency with the BREX.** If the SNS is defined within the BREX, then the project or the organization must ensure the consistency between the functional and/or physical area technical information repository data module and the definition of the SNS within the BREX. Refer to Para 2.

**Use of the disassembly code and disassembly code variant.** The project or the organization must decide if the disassembly codes and disassembly codes variants are managed in the functional and/or physical area technical repository or not. Refer to Para 2.

**Use of system difference code.** The project or the organization must decide if the system difference code must be populated in the functional and/or physical area technical repository or not. Refer to Para 2.

**Definition of the functional and/or physical area name.** The project or the organization must decide on the format of the functional and/or physical area name from the sub-subsystem level and apply these rules consistently in the project. This includes the case of the names and the source from which they are derived. Refer to Para 2.1.1.1.

**Reference mechanism.** The project or the organization must decide whether to use the implicit or explicit reference mechanism to the functional and/or physical technical repository. Refer to Chap 4.13.2 for details on the two reference mechanisms. Refer to Para 2.1.1.4.

# 4 Examples

The following example illustrates a functional item which is configuration dependant. As the zone can differ from one product range to the other, two alternate functional items have been defined.

```

## 1 General

The technical information repository data module type is used to capture and represent control and indicator information. This information assists personnel in determining the location and function of the controls and indicators.

## 2 Content

The technical information repository data module type is used to provide a list of the controls and indicators.

## 2.1 Controls and indicators repository

**Description:** The element <controlIndicatorRepository> is used to capture and represent control and indicator information.

**Markup element:** <controlIndicatorRepository> (M)

**Attributes:**

- id (O), the identifier of the <controlIndicatorRepository> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <controlIndicatorGroup> (M). Refer to Para 2.1.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- Use of the controls and indicators technical repository
- Use of a single or multiple control and indicator technical repository data modules

**Markup example:**

```
<controlIndicatorRepository>
<controlIndicatorGroup>...</controlIndicatorGroup>
</controlIndicatorRepository>
```

### 2.1.1 Control or indicator group

**Description:** The element <controlIndicatorGroup> (one or more) is used to contain unique identification of controls and indicators, each grouped by equipment, assembly, or control panel.

**Markup element:** <controlIndicatorGroup> (M)

**Attributes:**

- id (O), the identifier of the <controlIndicatorGroup> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <figure> (M). Refer to Chap 3.9.5.2.1.7.
- <controlIndicatorSpec> (M). Refer to Para 2.1.1.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the explicit reference mechanism. Refer to Chap 4.13.2.

**Markup example:**

```
<controlIndicatorGroup>
<figure>...</figure>
<controlIndicatorSpec>...</controlIndicatorSpec>
</controlIndicatorGroup>
```

2.1.1.1 Control and indicator information

**Description:** The element <controlIndicatorSpec> contains control and indicator information including illustration or index key, designation, and description. This element is the target when a control or indicator is referenced from another data module (eg procedural data module), using the element <controlIndicatorRef>. Refer to Chap 3.9.5.2.1.10.

**Markup element:** <controlIndicatorSpec> (M)

**Attributes:**

– controlIndicatorNumber (M), the identifier which can be used for implicit referencing within other data modules. Refer to Chap 4.13.2.
– applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.
– id (O), the identifier of the <controlIndicatorSpec> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– <controlIndicatorKey> (M). Refer to Para 2.1.1.1.1.
– <controlIndicatorName> (M). Refer to Para 2.1.1.1.2.
– <controlIndicatorDescr> (M). Refer to Para 2.1.1.1.3.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the implicit reference mechanism. Refer to Chap 4.13.2.

**Markup example:**

```
<controlIndicatorSpec controlIndicatorNumber="ci0005">
<controlIndicatorKey>...</controlIndicatorKey>
<controlIndicatorName>...</controlIndicatorName>
<controlIndicatorDescr>...</controlIndicatorDescr>
</controlIndicatorSpec>
```

*2.1.1.1.1 Control or indicator key*

**Description:** The element <controlIndicatorKey> contains the illustration or index key of the control or indicator.

**Markup element:** <controlIndicatorKey> (M)

**Attributes:**

- id (O), the identifier of the <controlIndicatorKey> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

```
<controlIndicatorKey>5</controlIndicatorKey>
```

*2.1.1.1.2 Control or indicator designation*

**Description:** The element <controlIndicatorName> contains the designation of the control or indicator.

**Markup element:** <controlIndicatorName> (M)

**Attributes:**

- id (O), the identifier of the <controlIndicatorName> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <subScript> (O). Refer to Chap 3.9.5.2.1.10.
- <superScript> (O). Refer to Chap 3.9.5.2.1.10.

**Business rules decisions:**

- None identified

**Markup example:**

```
<controlIndicatorName>Chrome Bell</controlIndicatorName>
```

*2.1.1.1.3 Control or indicator description*

**Description:** The element <controlIndicatorDescr> is used to store information specific to a control or indicator.

**Markup element:** <controlIndicatorDescr> (M)

**Attributes:**

- applicRefId (O), the applicability information. Refer to Chap 3.9.5.3.

- id (O), the identifier of the <controlIndicatorDescr> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <note> (O). Refer to Chap 3.9.3.
- <controlIndicatorFunction> (M). Refer to Para 2.1.1.1.4.

**Business rules decisions:**

- None identified

**Markup example:**

```
<controlIndicatorDescr>
<controlIndicatorFunction>...</controlIndicatorFunction>
</controlIndicatorDescr>
```

*2.1.1.1.4 Control or indicator function*

**Description:** The element <controlIndicatorFunction> is used to store one or more brief descriptions of the control or indicator function.

**Markup element:** <controlIndicatorFunction> (M)

**Attributes:**

- id (O), the identifier of the <controlIndicatorFunction> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <symbol> (O). Refer to Chap 3.9.5.2.1.10.
- <inlineSignificantData> (O). Refer to Chap 3.9.5.2.1.10.
- <subScript> (O). Refer to Chap 3.9.5.2.1.10.
- <superScript> (O). Refer to Chap 3.9.5.2.1.10.

**Business rules decisions:**

- None identified

**Markup example:**

```
<controlIndicatorFunction>Push button to turn light
<inlineSignificantData
significantParaDataType="psd10">ON</inlineSignificantData> or
<inlineSignificantData
significantParaDataType="psd10">OFF</inlineSignificantData>.</co
ntrolIndicatorFunction>
```

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use of the controls and indicators technical information repository.** The project or the organization must decide whether to use the controls and indicators technical information repository or not. Refer to Para 2.1.

**Use of several controls and indicators technical information repository data modules.** The project or the organization must decide whether there is one single control and indicator technical information repository data module or several depending of the SNS or not. In this case, granularity of these data modules is determined by the application of the SNS. Refer to Para 2.1.

**Implicit reference mechanism.** The project or the organization must decide whether to use implicit references or not. Refer to Para 2.1.1.1 and Chap 4.13.2.

**Explicit reference mechanism.** The project or the organization must decide whether to use explicit references or not. Refer to Chap 4.13.2.

# 1 General

This chapter details implementation of the container data module. The container data module provides a mechanism to associate several alternate data modules representing the same data. The general mechanism of the container data module is described in Chap 4.13.3.

# 2 Container data module content

## 2.1 Data module content

**Description:** This element is used to contain the container data module core content.

**Markup element:** <`content`> (M)

**Attributes:**

– `id` (M), the identifier of the <`content`> element. Refer to Chap 3.9.5.2.1.2.

**Child elements:**

– <`refs`> (O). Refer to Chap 3.9.5.2.1.2.
– <`container`> (M). Refer to Para 2.1.1.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the container data module or not.

**Markup example:**

```
<content>
<container>...</container>
</content>
```

### 2.1.1 Container

**Description:** This element is used to provide the list of alternate data modules, that the "container" contains.

**Markup element:** <container> (M)

**Attributes:**

– id (M), the identifier of the <container> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– <refs> (M), to refer to alternate data modules. Refer to Chap 3.9.5.2.1.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of applicability within container data module content

**Markup example:**

```
<container>
<refs/>
</container>
```

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use of container data module**. The project or the organization must decide if the container data module must be used or not. Refer to Para 2.

**Use of applicability within container data module content.** The project or the organization must decide if applicability annotations are duplicated from the referenced data modules to the container data module or not. Refer to Para 2.

# 4 Markup example

The following markup example illustrates a container data module referencing two alternate data modules.

```
<dmodule>

# 1 General

S1000D supports technical training information development through the use of the learning data module. The Schema for this data module structures technical learning content and configures it to the system being instructed in the lessons. It also maintains the use of standard S1000D XML structures. By maintaining the common S1000D structures, reuse between technical data and its supporting learning content is possible without the need for conversion from other formats.

## 1.1 Purpose

The purpose of this chapter is to introduce the methods for authoring learning content.

### 1.1.1 Why use S1000D for technical training data?

The primary reason for using S1000D for technical training content is to ensure that the training content is current with other system documentation throughout the life cycle. S1000D improves life cycle configuration management. It is crucial for a data manager to know how a system design change effects supporting documentation, including training. There must be a common thread linked throughout the life cycle support data. That thread is supported by S1000D metadata. The use of S1000D provides a common set of metadata for all life cycle supportability content, thereby enabling queries and tools to help manage the content en masse. S1000D serves as a common digital data format for technical data and technical training content.

### 1.1.2 How S1000D supports training content structures and file naming

Five new data structures have been designed to support the instructional design process. These structures have been modeled with course development, course content and course assessment in mind. The target instructional development audience is the technical training community. Learning content designed to teach maintenance procedures, system breakdown and repair can be supported with file names configured according to a meaningful data module code.

In addition, the data module code applied as a technical training content file name fills in an ADL Initiative (ADL) specification gap: ADL does not provide naming conventions in the Sharable Content Object Reference Model (SCORM). SCORM primarily addresses how a learning content package is constructed so that it operates in any SCORM-conformant Learning Management System (LMS). Naming conventions are left to individual learning development teams. S1000D fills the ADL/SCORM file naming gap by providing data module coding structures that configures the learning content to the supported systems and assemblies.

### 1.1.3 How S1000D works with SCORM

SCORM is a United States (US) Department of Defense specification developed by ADL. It has been adopted around the world. Its function is to ensure that an electronic learning content package is interoperable with any SCORM-conformant LMS. An LMS tracks the learner's progress through a course.

SCORM is a model that references a collection of learning-oriented specifications that work to collect, describe, enable and distribute learning. SCORM does not specify course content or data formats. The technology is applicable to any learning subject matter and any data format. S1000D is a markup specification and fills SCORM's data specification gap for technical learning content. S1000D can name, identify and structure technical learning content and offer configuration management support.

S1000D works with SCORM in the same way all other file format works with SCORM. SCORM, in its most basic function, references files of any type into a distributable content package for use on an LMS.

## 1.2 Scope

The learning Schema supports the development of technical learning objects. Object structures include support for needs analysis, learning objectives and interactive assessment. The intention is to support technical learning content in the life cycle logistics process.

# 2 Learning content

**Description:** This element is used to contain the five learning information types:

- learning plan
- learning overview
- learning content
- learning summary
- learning assessment

**Markup element:** <learning> (M)

**Attributes:**

– None

**Child elements:**

– <learningPlan> (O). This element is used to contain the learning planning information. Refer to Chap 3.9.5.2.13.1.
– <learningOverview> (O). This element is used to contain the learning overview. Refer to Chap 3.9.5.2.13.2.
– <learningContent> (O). This element is used to contain the learning content. Refer to Chap 3.9.5.2.13.3.
– <learningSummary> (O). This element is used to contain the learning summary. Refer to Chap 3.9.5.2.13.4.
– <learningAssessment> (O). This element is used to contain the learning assessment. Refer to Chap 3.9.5.2.13.5.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

– Use of the available branches

**Markup example:**

For examples of markup of the child elements, see Chap 3.9.5.2.13.1 thru Chap 3.9.5.2.13.5.

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

**Use of the available branches**. The project or the organization must decide which of the five available branches is most appropriate for the intended content. Refer to Para 2.

# 1 General

The learning plan information model is the first branch in the learning schema. It contains content, such as learning objectives, that drives course strategy and development. The learning plan structure covers five essential components to the lesson planning process: course administrative details, needs analysis, gap analysis, instructional design and technical requirements.

# 2 Learning plan content

**Description:** A learning plan topic describes learning needs and goals, instructional design models, task analyses, learning taxonomies, and other information necessary to the lesson planning process. The learning plan structure is contained within the element <`learning`>.

**Markup element:** <`learningPlan`> (O)

**Attributes:**

- `id` (O), the identifier of the <`learningPlan`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <`lcProject`> (O). Refer to Para 2.1
- <`lcNeedsAnalysis`> (O). Refer to Para 2.2
- <`lcGapAnalysis`> (O). Refer to Para 2.3
- <`lcIntervention`> (O). Refer to Para 2.4
- <`lcTechnical`> (M). Refer to Para 2.5

**Business rules decisions:**

- Developing learning objectives in accordance with task analysis items
- Packaging lesson plans in SCORM content packages

**Markup example:**

Refer to Para 4.

## 2.1 Project

**Description:** The element <lcProject> is the first high level container element in the element <learningPlan>. It contains the learning content project plan description.

**Markup element:** <lcProject> (O)

**Attributes:**

- id (O), the identifier of the <lcProject> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <title> (O). Refer to Para 2.1.1
- <description> (O). Refer to Para 2.1.2
- <lcClient> (O). Refer to Para 2.1.3
- <lcPlanTitle> (O). Refer to Para 2.1.4
- <lcCIN> (O). Refer to Para 2.1.5
- <lcModDate> (O). Refer to Para 2.1.6
- <lcDelivDate> (O). Refer to Para 2.1.7
- <lcPlanSubject> (O). Refer to Para 2.1.8
- <lcPlanDescript> (O). Refer to Para 2.1.9
- <lcPlanPrereqs> (O). Refer to Para 2.1.10

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

### 2.1.1 Title

**Description:** The element <title> contains a title for the element which it is contained in. It is used in accordance with the rules in Chap 3.9.5.2.1.5.

**Markup element:** <title> (O)

**Attributes:**

- id (O), the identifier of the <title> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.

- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

### 2.1.2 Description

**Description:** The element <`description`> contains a description for the element which it is contained in. It is used in accordance with the rules in Chap 3.9.5.2.

**Markup element:** <`description`> (O)

**Attributes:**

- `id` (O), the identifier of the <`description`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

### 2.1.3 Client

**Description:** The element <`lcClient`> provides the person or organization sponsoring or requiring the learning event development.

**Markup element:** <`lcClient`> (O)

**Attributes:**

- `id` (O), the identifier of the <`lcClient`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <`title`> (O). Refer to Para 2.1.1
- <`description`> (C). Refer to Para 2.1.2

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

### 2.1.4 Plan Title

**Description:** The element <`lcPlanTitle`> provides a title for the lesson plan.

**Markup element:** <`lcPlanTitle`> (O)

**Attributes:**

– `id` (O), the identifier of the <`lcPlanTitle`> element. Refer to Chap 3.9.5.2.1.2.
– `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
– `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– <`title`> (O). Refer to Para 2.1.1
– <`description`> (C). Refer to Para 2.1.2

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

### 2.1.5 Course Identification Number

**Description:** The element <`lcCIN`> provides an alpha-numeric alternate identifier to the project title.

**Markup element:** <`lcCIN`> (O)

**Attributes:**

– `id` (O), the identifier of the <`lcCIN`> element. Refer to Chap 3.9.5.2.1.2.
– `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
– `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– <`title`> (O). Refer to Para 2.1.1
– <`description`> (C). Refer to Para 2.1.2

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

### 2.1.6 Modification Date

**Description:** The element <`lcModDate`> provides the project modification date.

**Markup element:** <`lcModDate`> (O)

**Attributes:**

– `id` (O), the identifier of the <`lcModDate`> element. Refer to Chap 3.9.5.2.1.2.
– `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
– `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– <`title`> (O). Refer to Para 2.1.1
– <`description`> (C). Refer to Para 2.1.2

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

### 2.1.7 Delivery Date

**Description:** The element <`lcDelivDate`> provides the project delivery date.

**Markup element:** <`lcDelivDate`> (O)

**Attributes:**

– `id` (O), the identifier of the <`lcDelivDate`> element. Refer to Chap 3.9.5.2.1.2.
– `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
– `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– <`title`> (O). Refer to Para 2.1.1
– <`description`> (C). Refer to Para 2.1.2

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

### 2.1.8 Subject

**Description:** The element <`lcPlanSubject`> provides a complete description of the subject of the planned learning.

**Markup element:** <`lcPlanSubject`> (O)

**Attributes:**

– `id` (O), the identifier of the <`lcPlanSubject`> element. Refer to Chap 3.9.5.2.1.2.
– `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
– `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– <`title`> (O). Refer to Para 2.1.1
– <`description`> (C). Refer to Para 2.1.2

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

### 2.1.9 Plan Description

**Description:** The element <`lcPlanDescrip`> provides a complete description of the learning plan.

**Markup element:** <`lcPlanDescrip`> (O)

**Attributes:**

– `id` (O), the identifier of the <`lcPlanDescrip`> element. Refer to Chap 3.9.5.2.1.2.
– `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
– `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– <`title`> (O). Refer to Para 2.1.1
– <`description`> (C). Refer to Para 2.1.2

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

### 2.1.10 Plan Prerequisites

**Description:** The element <lcPlanPreReqs> provides the knowledge, skills, abilities, courses and other activities learners must have satisfied to take the instruction.

**Markup element:** <lcPlanPreReqs>

**Attributes:**

– id (O), the identifier of the <lcPlanPreReqs> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– <title> (O). Refer to Para 2.1.1
– <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

## 2.2 Needs Analysis

**Description:** This is the second high level container element in the element <learningPlan>. It describes the training requirement and identifies the need to develop or revise content. These include periodic training gap analyses, changes to operational or maintenance requirements, and changes to equipment or systems.

**Markup element:** <lcNeedsAnalysis> (O)

**Attributes:**

– id (O), the identifier of the <lcNeedsAnalysis> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– <title> (O). Refer to Para 2.1.1

- <description> (O). Refer to Para 2.1.2
- <lcOrganizational> (O). Refer to Para 2.2.1
- <lcPlanAudience> (O). Refer to Para 2.2.2
- <lcWorkEnv> (O). Refer to Para 2.2.3
- <lcTask> (O). Refer to Para 2.2.4

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

### 2.2.1 Organizational

**Description:** The element <lcOrganizational> is the first wrapper within <lcNeedsAnalysis>. It describes the organization's learning requirements.

**Markup element:** <lcOrganizational> (O)

**Attributes:**

- id (O), the identifier of the <lcOrganizational> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <title> (O). Refer to Para 2.1.1
- <lcGeneralDescription> (O). Refer to Para 2.2.1.1
- <lcGoals> (O). Refer to Para 2.2.1.2
- <lcNeeds> (O). Refer to Para 2.2.1.3
- <lcValues> (O). Refer to Para 2.2.1.4
- <lcOrgConstraints> (O). Refer to Para 2.2.1.5

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

#### 2.2.1.1 General Description

**Description:** The element <lcGeneralDescription> provides a space to develop a general description about the organization's training needs.

**Markup element:** <lcGeneralDescription> (O)

**Attributes:**

- id (O), the identifier of the <lcGeneralDescription> element. Refer to Chap 3.9.5.2.1.2.

- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <`description`> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

2.2.1.2 Goals

**Description:** The element <`lcGoals`> describes the outcomes desired by the organization to be addressed by the training effort. These goals may require concurrent efforts outside of training such as technology acquisition, reorganization, and so forth.

**Markup element:** <`lcGoals`> (O)

**Attributes:**

- `id` (O), the identifier of the <`lcGoals`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <`description`> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

2.2.1.3 Needs

**Description:** The element <`lcNeeds`> describes the needs behind the outcomes described in the element <`lcGoals`>.

**Markup element:** <`lcNeeds`> (O)

**Attributes:**

- `id` (O), the identifier of the <`lcNeeds`> element. Refer to Chap 3.9.5.2.1.2.

- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

2.2.1.4 Values

**Description:** The element <lcValues> describes affective components of desired instructional outcomes.

**Markup element:** <lcValues> (O)

**Attributes:**

- id (O), the identifier of the <lcValues> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

2.2.1.5 Organizational Constraints

**Description:** The element <lcOrgConstraints> describes organizational aspects that may limit the organization's ability to effectively use the instruction to meet its goals.

**Markup element:** <lcOrgConstraints> (O)

**Attributes:**

- id (O), the identifier of the <lcOrgConstraints> element. Refer to Chap 3.9.5.2.1.2.

- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

### 2.2.2 Audience

**Description:** The element <lcPlanAudience> is the second wrapper within the element <lcNeedsAnalysis>. It describes the learners' profile taking the instruction.

**Markup element:** <lcPlanAudience> (O)

**Attributes:**

- id (O), the identifier of the <lcPlanAudience> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <title> (O). Refer to Para 2.1
- <lcGeneralDescription> (O). Refer to Para 2.2.1.1
- <lcEdLevel> (O). Refer to Para 2.2.2.1
- <lcAge> (O). Refer to Para 2.2.2.2
- <lcBackground> (O). Refer to Para 2.2.2.3
- <lcSkills> (O). Refer to Para 2.2.2.4
- <lcKnowledge> (C). Refer to Para 2.2.2.5
- <lcMotivation> (C). Refer to Para 2.2.2.6
- <lcSpecChars> (O). Refer to Para 2.2.2.7

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

2.2.2.1 Education Level

**Description:** The element <lcEdLevel> describes the range of learners' education level and the relevancy to the learning plan.

**Markup element:** <lcEdLevel> (O)

**Attributes:**

- id (O), the identifier of the <lcEdLevel> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

2.2.2.2 Age

**Description:** The element <lcAge> describes the learners' age range.

**Markup element:** <lcAge> (O)

**Attributes:**

- id (O), the identifier of the <lcAge> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

2.2.2.3 Background

**Description:** The element <lcBackground> describes the learners' professional background and the relevancy to the learning plan.

**Markup element:** <lcBackground> (O)

**Attributes:**

- id (O), the identifier of the <lcBackground> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

2.2.2.4 Skills

**Description:** The element <lcSkills> describes the learners' current skill set and the relevancy to the learning plan.

**Markup element:** <lcSkills> (O)

**Attributes:**

- id (O), the identifier of the <lcSkills> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

2.2.2.5 Knowledge

**Description:** The element <lcKnowledge> describes the learners' current knowledge of the learning topics.

**Markup element:** <lcKnowledge> (C)

**Attributes:**

- id (O), the identifier of the <lcKnowledge> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

2.2.2.6 Motivation

**Description:** The element <lcMotovation> describes the reasons why the learners' want and/or need to take the instruction.

**Markup element:** <lcMotivation> (C)

**Attributes:**

- id (O), the identifier of the <lcMotivation> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

2.2.2.7 Special Characteristics

**Description:** The element <lcSpecChars> describes learner characteristics specific to the population that will influence the design, including learning disabilities, physical handicaps, and so forth.

**Markup element:** <lcSpecChars> (O)

**Attributes:**

- id (O), the identifier of the <lcSpecChars> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

### 2.2.3 Work Environment

**Description:** The element <lcWorkEnv> is the third wrapper tag within the element <lcNeedsAnalysis>. It describes the working conditions and contexts in which the training will be applied.

**Markup element:** <lcWorkEnv> (O)

**Attributes:**

- id (O), the identifier of the <lcWorkEnv> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <title> (O). Refer to Para 2.1.1
- <lcWorkEnvDescription> (C). Refer to Para 2.2.3.1
- <lcPlanResources> (O). Refer to Para 2.2.3.2
- <lcProcesses> (O). Refer to Para 2.2.3.3

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

#### 2.2.3.1 Work Environment Description

**Description:** The element <lcWorkEnvDescription> describes the general working environment in which the training will be applied.

**Markup element:** <lcWorkEnvDescription> (C)

**Attributes:**

- id (O), the identifier of the <lcWorkEnvDescription> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

2.2.3.2 Plan Resources

**Description:** The element <lcPlanResources> describes the materials available to learners for learning in the course of their daily routine. It may include computers, books, manuals, tutors.

**Markup element:** <lcPlanResources> (O)

**Attributes:**

- id (O), the identifier of the <lcPlanResources> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

2.2.3.3 Processes

**Description:** The element <lcProcesses> describes processes learners routinely follow – ISO, SOPs, etc.

**Markup element:** <lcProcesses> (O)

**Attributes:**

- id (O), the identifier of the <lcProcesses> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

### 2.2.4 Task

**Description:** The element <lcTask> is the fourth wrapper within the element <lcNeedsAnalysis>. It captures a work item to be performed.

**Markup element:** <lcTask> (O)

**Attributes:**

- id (O), the identifier of the <lcTask> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <title> (O). Refer to Para 2.1.1
- <lcTaskItem> (C). Refer to Para 2.2.4.1
- <lcKnowledge> (O). Refer to Para 2.2.4.2
- <lcSkills> (O). Refer to Para 2.2.4.3
- <lcAttitude> (O). Refer to Para 2.2.4.4

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

2.2.4.1 Task Item

**Description:** The element <lcTaskItem> is a repeatable wrapper describing discrete tasks to be taught.

**Markup element:** <lcTaskItem> (O)

**Attributes:**

- id (O), the identifier of the <lcTaskItem> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

2.2.4.2 Knowledge

**Description:** The element <lcKnowledge> describes foundational information required to accomplish the tasks.

**Markup element:** <lcKnowledge> (O)

**Attributes:**

- id (O), the identifier of the <lcKnowledge> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

2.2.4.3 Skills

**Description:** The element <lcSkills> describes enduring attributes that facilitate learning and is directly associated with a task.

**Markup element:** <lcSkills> (O)

**Attributes:**

- id (O), the identifier of the <lcSkills> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

2.2.4.4 Attitude

**Description:** The element <lcAttitude> describes the mental state that influences the choices of personal actions.

**Markup element:** <lcAttitude> (O)

**Attributes:**

- id (O), the identifier of the <lcAttitude> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

## 2.3 Gap Analysis

**Description:** The element <lcGapAnalysis> is the third high level container within the element <lcLearningPlan>. Analysis compares existing learning objectives to current job task analysis (JTA).

**Markup element:** <lcGapAnalysis> (O)

**Attributes:**

- id (O), the identifier of the <lcGapAnalysis> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <title> (O). Refer to Para 2.1.1
- <shortDesc> (C). Refer to Para 2.3.1
- <lcGapItem> (O). Refer to Para 2.3.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

### 2.3.1 Short Description

**Description:** The element <shortDescr> gives a description of the element which it is contained in.

**Markup element:** <shortDescr> (O)

**Attributes:**

- id (O), the identifier of the <shortDescr> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

### 2.3.2 Gap Item

**Description:** The element <lcGapItem> is a repeatable wrapper capturing gaps between existing training objectives and related job-task-analysis content.

**Markup element:** <lcGapItem> (O)

**Attributes:**

- id (O), the identifier of the <lcGapItem> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <title> (O). Refer to Para 2.1.1
- <shortDescr> (O). Refer to Para 2.3.1
- <lcPlanObjective> (O). Refer to Para 2.3.2.1
- <lcJtaItem> (O). Refer to Para 2.3.2.2
- <lcGapItemDelta> (C). Refer to Para 2.3.2.3

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

#### 2.3.2.1 Learning Plan Objective

**Description:** The element <lcPlanObjective> describes actions, behaviors, conditions and standards required of the learner in order to complete a course.

**Markup element:** <lcPlanObjective> (O)

**Attributes:**

- id (O), the identifier of the <lcPlanObjective> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

2.3.2.2 Job Task Analysis Item

**Description:** The element <lcJtaItem> provides the description of job task analysis as related to a particular learning objective.

**Markup element:** <lcJtaItem> (O)

**Attributes:**

- id (O), the identifier of the <lcJtaItem> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

2.3.2.3 Gap Item Delta

**Description:** The element <lcGapItemDelta> describes the gap between the learning objective and the job task analysis.

**Markup element:** <lcGapItemDelta> (C)

**Attributes:**

- id (O), the identifier of the <lcGapItemDelta> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

## 2.4 Intervention

**Description:** The element <lcIntervention> is the fourth wrapper under the element <learningPlan>. It describes the approach and strategies to building the learning materials based on the element <lcNeedsAnalysis> content.

**Markup element:** <lcIntervention> (O)

**Attributes:**

- id (O), the identifier of the <lcIntervention> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <title> (O). Refer to Para 2.1.1
- <shortDescr> (O). Refer to Para 2.3.1
- <lcInterventionItem> (O). Refer to Para 2.4.1

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

### 2.4.1 Intervention Item

- **Description:** The element <lcInterventionItem> is a repeatable wrapper describing how learning content is built. It describes the systems approach to analyzing, designing, developing, implementing, and evaluating any instructional experience.

**Markup element:** <lcInterventionItem> (O)

**Attributes:**

- id (O), the identifier of the <lcInterventionItem> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <title> (O). Refer to Para 2.1.1
- <shortDescr> (O). Refer to Para 2.3.1
- <lcLearnStrat> (O). Refer to Para 2.4.1.1
- <lcPlanObjective> (O). Refer to Para 2.4.1.2

- <lcAssessment> (O). Refer to Para 2.4.1.3
- <lcDelivery> (O). Refer to Para 2.4.1.4

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

2.4.1.1 Learning Strategy

**Description:** The element <lcLearnStrat> describes the manner in which the learning content will be instructed. It should be a high level design that applies instructional-design theories and models.

**Markup element:** <lcLearnStrat> (O)

**Attributes:**

- id (O), the identifier of the <lcLearnStrat> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

2.4.1.2 Learning Objective

**Description:** The element <lcPlanObjective> describes actions, behaviors, conditions and standards required of the learner in order to complete a course.

**Markup element:** <lcPlanObjective> (O)

**Attributes:**

- id (O), the identifier of the <lcPlanObjective> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

2.4.1.3 Assessment

**Description:** The element <lcAssessment> describes the manner in which the learning will be assessed. It is the high level design that captures how embedded, pre- and post-assessments will be employed.

**Markup element:** <lcAssessment> (O)

**Attributes:**

– id (O), the identifier of the <lcAssessment> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

– None identified

**Markup example:**

Refer to Para 4.

2.4.1.4 Delivery

**Description:** The element <lcDelivery> describes the instructional delivery methods and technologies. To maximize training effectiveness and optimize resource utilization, content developed should be founded upon needs and job task analysis data and leverage instructional delivery methods and technologies (eg, computer-based, web-based, video, performance support systems). A training delivery analysis includes review of the NLOS, identification and evaluation of available delivery options, and selection of the optimum delivery means.

**Markup element:** <lcDelivery> (O)

**Attributes:**

– id (O), the identifier of the <lcDelivery> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.

- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <`description`> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

## 2.5 Technical

**Description:** The element <`lcTechnical`> is the fifth high level container element under the element <`learningPlan`>. It describes the technical requirements to the learning content and how those requirements are supported by the instructional design.

**Markup element:** <`lcTechnical`> (O)

**Attributes:**

- `id` (O), the identifier of the <`lcTechnical`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <`title`> (O). Refer to Para 2.1.1
- <`shortDescr`> (O). Refer to Para 2.3.1
- <`lcLMS`> (O). Refer to Para 2.5.1
- <`lcNoLMS`> (O). Refer to Para 2.5.2
- <`lcClassroom`> (O). Refer to Para 2.5.3
- <`lcOJT`> (O). Refer to Para 2.5.4
- <`lcConstraints`> (O). Refer to Para 2.5.5
- <`lcW3C`> (O). Refer to Para 2.5.6
- <`lcPlayers`> (O). Refer to Para 2.5.7
- <`lcGraphics`> (O). Refer to Para 2.5.8
- <`lcViewers`> (O). Refer to Para 2.5.9
- <`lcResolution`> (O). Refer to Para 2.5.10
- <`lcFileSizeLimitations`> (O). Refer to Para 2.5.11
- <`lcDownloadTime`> (O). Refer to Para 2.5.12
- <`lcSecurity`> (O). Refer to Para 2.5.13

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

### 2.5.1 LMS

**Description:** The element <lcLMS> describes the LMS name and version number.

**Markup element:** <lcLMS> (O)

**Attributes:**

- id (O), the identifier of the <lcLMS> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

### 2.5.2 NoLMS

**Description:** The element <lcNoLMS> describes any technical requirements when SCORM and an LMS is not required.

**Markup element:** <lcNoLMS> (O)

**Attributes:**

- id (O), the identifier of the <lcNoLMS> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

### 2.5.3 Classroom

**Description:** The element <lcClassroom> describes technical aspects of the course to take place in a classroom.

**Markup element:** <lcClassroom> (O)

**Attributes:**

- id (O), the identifier of the <lcClassroom> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

### 2.5.4 On The Job Training

**Description:** The element <lcOJT> describes technical aspects of the course taking place in the work environment.

**Markup element:** <lcOJT> (O)

**Attributes:**

- id (O), the identifier of the <lcOJT> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

### 2.5.5 Constraints

**Description:** The element <lcConstraints> describes constraints imposed by the technologies used to create, distribute, deliver, and display the instruction. For example, if constraints are not met, the learner will not experience the instruction as designed. These must be considered in light of how the instruction will be used in relation to the learning objectives.

**Markup element:** <lcConstraints> (O)

**Attributes:**

- id (O), the identifier of the <lcConstraints> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

### 2.5.6 World Wide Web Consortium (W3C)

**Description:** The element <lcW3C> describes standards used for data accessibility and conformity to standards.

**Markup element:** <lcW3C> (O)

**Attributes:**

- id (O), the identifier of the <lcW3C> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

### 2.5.7 Players

**Description:** The element <lcPlayers> describes tools used for time-sequenced display at runtime.

**Markup element:** <lcPlayers> (O)

**Attributes:**

- id (O), the identifier of the <lcPlayers> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

### 2.5.8 Graphics

**Description:** The element <lcGraphics> describes standards and system requirements for displaying graphics, 3D animations from CAD, navigation through virtual spaces, etc.

**Markup element:** <lcGraphics> (O)

**Attributes:**

- id (O), the identifier of the <lcGraphics> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

### 2.5.9 Viewers

**Description:** The element <lcViewers> describes viewers used for time-sequenced display at runtime.

**Markup element:** <lcViewers> (O)

**Attributes:**

- id (O), the identifier of the <lcViewers> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

### 2.5.10 Resolution

**Description:** The element <lcResolution> describes the required computer screen resolution delivered instruction.

**Markup element:** <lcResolution> (O)

**Attributes:**

- id (O), the identifier of the <lcResolution> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

### 2.5.11 File Size Limitations

**Description:** The element <lcFileSizeLimitations> describes the file size limitations in the client's delivery environment.

**Markup element:** <lcFileSizeLimitations> (O)

**Attributes:**

- id (O), the identifier of the <lcFileSizeLimitations> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

### 2.5.12 Download Time

**Description:** The element <lcDownloadTime> describes the maximum time allowed for download time in the client's delivery environment.

**Markup element:** <lcDownloadTime> (O)

**Attributes:**

- id (O), the identifier of the <lcDownloadTime> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

### 2.5.13 Security

**Description:** The element <lcSecurity> describes the security requirements in the delivered instruction.

**Markup element:** <lcSecurity> (O)

**Attributes:**

- id (O), the identifier of the <lcSecurity> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.1.2

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4.

# 3 Business rules decisions

Refer to Chap 2.5 for an overview of business rule categories and layers that ought to be considered for S1000D technical lesson plan development projects. Business rule decisions will vary from project to project. Below are suggested considerations for technical lesson plan development projects.

Business rules decisions include, but are not limited to, the following:

**Developing learning objectives in accordance with task analysis items.** Learning objectives ought to be developed in accordance with task analysis items that support system maintenance and operational procedures. Aligning learning objectives with task analysis items in the early content preplanning stages will foster reusable data and content alignment. See Chap 3.9.7 for content preplanning discussions.

**Packaging lesson plans in SCORM content packages.** Lesson plans are not traditionally viewed or utilized by learners. However, a lesson plan is the precursor and the foundation to instructional material. Kept together, lesson plans and the learning content developed from the plans form a complete instructional unit.

As of the release of S1000D version 4, lesson plans have not been aggregated into SCORM conformant learning content packages. In addition, technical learning content has not been named or structured according to S1000D learning information models. The question of inserting lesson plans into a content package is new. Its utility is primarily associated with instructors registering learning content and other instructors searching for learning content. The SCORM learning object metadata (LOM) can describe a course. The LOM does not constitute a lesson plan. Inserting a lesson plan into a content package which forms a complete instructional unit benefits the instructor searching for content. The business rules for associating lesson plans with a content package must be developed through best practices and prototypes then communicated throughout the learning community.

# 4 Markup Example

Below is a complete markup example for the element <lcLearningPlan>. It describes an actual lesson plan developed by ADL covering ADL implementation for defense acquisition professionals.

```
<learningPlan id="learningPlanTest">
<lcProject>

<description>
<para>Lesson 5 will consist of three SCOs, available from the
LMS table of contents. The lesson addresses teaching points that
support the module objectives. The lesson has one terminal
learning objective (TLO); and each SCO will have two or more
enabling learning objectives (ELOs). The lesson material will be
"chunked" into clearly defined, separate topics to facilitate
the learning. The lesson will also feature instructional
elements to keep the learner mentally and actively engaged to
aid in learning reinforcement. Each SCO will include Knowledge
Review questions that check and reinforce learners'
comprehension. Knowledge Reviews are not graded. These questions
may consist of multiple-choice (one correct answer), multiple
answers (more than one correct answer), one-line fill-in-the-
blank, hot graphic area or ranking. Immediate feedback to
learners after each correct response and after the final
incorrect response provides reinforcement and clarification to
learning. Depending upon the structure of the question, learners
will have one or more opportunities to answer the question
correctly. Learners will receive remediation if answers to
true/false questions are incorrect on the first try or, for
multiple choice and multiple answer questions, after the second
try. A return button allows learners to return to the question
screen and try again.</para>

## 1 General

The learning overview information model is the second module in the learning schema. It contains content, such as learning objectives, that introduces the course to students.

# 2 Learning overview content

**Description:** The learning overview structure covers introductory course information. It identifies the learning objectives, includes other information helpful to the learner, such as prerequisites, duration, intended audience, and can include information and strategies that seek to gain attention and stimulate recall of prior learning.

**Markup element:** <learningOverview> (O)

**Attributes:**

- id (O), the identifier of the <learningOverview> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <title> (C). Refer to Para 2.1.
- <shortDescr> (O). Refer to Para 2.2.
- <lcIntro> (O). Refer to Para 2.3.
- <lcAudience> (O). Refer to Para 2.4.
- <lcDuration> (O). Refer to Para 2.5.
- <1cPrereqs> (O). Refer to Para 2.6.
- <lcObjectives> (O). Refer to Para 2.7.
- <lcResources> (O). Refer to Para 2.8.
- <lcSection> (O). Refer to Para 2.9.

Business rules:

Business rules decisions include, but are not limited to, the following:

- Discussing learning objectives in accordance with system task analysis.

**Markup example:**

```
<learningOverview>
<title>...</title>
</learningOverview>
```

## 2.1 Title

**Description:** The <title> element provides a title for the element which it is contained in. It is used in accordance with the rules in Chap 3.9.5.2.1.5.

**Markup element:** <title> (C)

## 2.2 Short description

**Description:** The element <shortDescr> gives a description of the element which it is contained in.

**Markup element:** <shortDescr> (O)

**Attributes:**

- id (O), the identifier of the <shortDescr> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- None

**Business rules decisions:**

- None identified

**Markup example:**

Refer to Para 4

## 2.3 Introduction

**Description:** The element <lcIntro> provides a detailed introduction and description of the content to be delivered, in cases where the <shortDescr> is not adequate to fully describe the content.

**Markup element:** <lcIntro> (O)

**Attributes:**

- id (O), the identifier of the <lcIntro> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.3.1.

Business rules:

- None identified

**Markup example:**

```
<lcIntro>
<description>...</description>
</lcIntro>
```

### 2.3.1 Description

**Description:** The element <description> contains a description for the element which it is contained in. It is used in accordance with the rules in Chap 3.9.5.2.

**Markup element:** <description> (C)

## 2.4 Audience

**Description:** The element <lcAudience> describes the learner's profile taking the instruction.

**Markup element:** <lcAudience> (O)

**Attributes:**

- id (O), the identifier of the <lcAudience> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.3.1.

Business rules:

- None identified

**Markup example:**

```
<lcAudience>
<description>...</description>
</lcAudience>
```

## 2.5 Duration

**Description:** The element <lcDuration> provides an estimated duration for the learning activity.

**Markup element:** <lcDuration> (O)

**Attributes:**

- id (O), the identifier of the <lcDuration> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <title> (O). Refer to Para 2.1.
- <lcTime> (O). Refer to Para 2.5.1.

Business rules:

- None identified

**Markup example:**

```
<lcDuration>...</lcDuration>
```

### 2.5.1 Time

**Description:** The element <lcTime> specifies the time expected to complete an activity.

**Markup element:** <lcTime> (O)

**Attributes:**

- id (O), the identifier of the <lcTime> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.3.1.

Business rules:

- None identified

**Markup example:**

```
<lcTime>
<description>...</description>
</lcTime>
```

## 2.6 Prerequisites

**Description:** The element <1cPrereqs> describes required knowledge, credits and experience a student must have to take a course.

**Markup element:** <1cPrereqs> (O)

**Attributes:**

- id (O), the identifier of the <1cPrereqs> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.3.1.

Business rules:

- None identified

**Markup example:**

```
<lcPrereqs>
<description>...</description>
</lcPrereqs>
```

## 2.7 Objectives

**Description:** The element <lcObjectives> lists or describes the learning goals.

**Markup element:** <lcObjectives> (O)

**Attributes:**

- id (O), the identifier of the <lcObjectives> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <title> (O). Refer to Para 2.1.
- <lcObjectivesStem> (O). Refer to Para 2.7.1.
- <lcObjectiveGroup> (O). Refer to Para 2.7.2.

Business rules:

- None identified

**Markup example:**

```
<lcObjectives>
<lcObjectivesStem>...</lcObjectivesStem>
<lcObjectiveGroup>...</lcObjectiveGroup>
</lcObjectives>
```

### 2.7.1 Objectives stem

**Description:** The element <lcObjectivesStem> provides a leading sentence to introduce a list of learning objectives.

**Markup element:** <lcObjectivesStem> (O)

**Attributes:**

- id (O), the identifier of the <lcObjectivesStem> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.3.1.

Business rules:

- None identified

**Markup example:**

```
<lcObjectivesStem>
<description>...</description>
</lcObjectivesStem>
```

### 2.7.2 Objective group

**Description:** The element <lcObjectiveGroup> provides contains a list of one or more learning objectives.

**Markup element:** <lcObjectiveGroup> (O)

**Attributes:**

- id (O), the identifier of the <lcObjectiveGroup> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <lcObjective> (C). Refer to Para 2.7.2.1.

Business rules:

- None identified

**Markup example:**

```
<lcObjectiveGroup>
<lcObjective>
<description><para>...</para></description>
</lcObjective>
</lcObjectiveGroup>
```

#### 2.7.2.1 Objective

**Description:** The element <lcObjective> describes a single learning objective.

**Markup element:** <lcObjective> (C)

**Attributes:**

- id (O), the identifier of the <lcObjective> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.3.1.

Business rules:

– None identified

**Markup example:**

```
<lcObjective>
<description>...</description>
</lcObjective>
```

## 2.8 Resources

**Description:** The element <lcResources> provides a list of related resources and information about them, such as related articles or samples on the web.

**Markup element:** <lcResources> (O)

**Attributes:**

– id (O), the identifier of the <lcResources> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– <description> (C). Refer to Para 2.3.1.

Business rules:

– None identified

**Markup example:**

```
<lcResources>
<description>...</description>
</lcResources>
```

## 2.9 Section

**Description:** The element <lcSection> provides a generic element to contain other learning content.

**Markup element:** <lcSection> (O)

**Attributes:**

– id (O), the identifier of the <lcSection> element. Refer to Chap 3.9.5.2.1.2.
– changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
– authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
– securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

– <description> (C). Refer to Para 2.3.1.

Business rules:

– None identified

**Markup example:**

```
<lcSection>
<description>...</description>
</lcSection>
```

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

Refer to Chap 2.5 for an overview of business rule categories and layers that ought to be considered for S1000D technical learning overview development projects. Business rules decisions will vary from project to project. Below are suggested considerations any technical learning overview development project.

**Discussing learning objectives in accordance with system task analysis.** Learning objectives must be documented in accordance with task analysis items that support system maintenance and operational procedures. Ensure that the learning objectives are linked with the task analysis items in the technical documentation Student awareness of learning objectives in alignment with system task analysis with improve course content context. The early content preplanning stages will foster reusable data and content alignment. Refer to Para 2.

Refer to Chap 3.9.7 for content preplanning discussions.

# 4 Examples

Below is a markup example for <learningOverview>. It describes a short lesson on using an email program.

```
<learning>
<learningOverview id="understanding_the_basics">
<title>Overview: Understanding the basics</title>
<shortDescr>Mail basics start from the inbox, viewing and
opening messages you receive, and moving them to appropriate
mail folders for easy access and retrieval.</shortDescr>
<lcAudience><description><para>The intended audience includes
new users of the company email system and anyone wanting a
refresher on the basic features.</para></description>
</lcAudience>
<lcDuration>
<title>Expected duration</title>
<lcTime>
<description>

## 1 General

The learning content information model provides the bulk of the learning content. The learning content structure covers learning objectives, learning activities and language that forms the learning materials. It holds the most potential for the appropriate reuse of technical data where content supplements are useful.

# 2 Learning content

**Description:** A learning content topic comprises a set of self-contained content about a single terminal learning objective supported by zero or more enabling learning objectives. It provides the learning content itself, and enables direct use of content from the S1000D descript data module. It supports specific objectives declared in the Learning plan topic type.

**Markup element:** <learningContent> (O)

**Attributes:**

- id (O), the identifier of the <learningContent> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <title> (C). Refer to Para 2.1.
- <shortDescr> (O). Refer to Para 2.2.
- <lcIntro> (O). Refer to Para 2.3.
- <lcDuration> (O). Refer to Para 2.4.
- <lcObjectives> (O). Refer to Para 2.5.
- <lcChallenge> (O). Refer to Para 2.6.
- <lcInstruction> (O). Refer to Para 2.7.

Business rules:

Business rules decisions include, but are not limited to, the following:

- Reuse or repurposing of technical data
- Development of multimedia or graphics

**Markup example:**

Refer to Para 4

## 2.1 Title

**Description:** The element <title> provides a title for the element which it is contained in. It is used in accordance with the rules in Chap 3.9.5.2.1.5.

**Markup element:** <title> (C)

## 2.2 Short description

**Description:** The element <shortDescr> provides a short description of the learning content portion of the course or lesson. Refer to Chap 3.9.5.2.13.2 for details.

**Markup element:** <shortDescr> (O)

## 2.3 Introduction

**Description:** The element <lcIntro> provides a detailed introduction and description of the learning content in cases where the <shortDescr> is not adequate to fully describe the content. Refer to Chap 3.9.5.2.13.2 for details.

**Markup element:** <lcIntro> (O)

## 2.4 Duration

**Description:** The element <lcDuration> provides an estimated duration for the learning activity. Refer to Chap 3.9.5.2.13.2 for details.

**Markup element:** <lcDuration> (O)

## 2.5 Objectives

**Description:** The element <lcObjectives> lists or describes the learning goals. Refer to Chap 3.9.5.2.13.2 for details.

**Markup element:** <lcObjectives> (O)

## 2.6 Challenge

**Description:** The element <lcChallenge> describes student practice exercises. For example, if network diagrams are the subject matter, a challenge might be "put this network into its proper sequence".

**Markup element:** <lcChallenge> (O)

**Attributes:**

- id (O), the identifier of the <lcChallenge> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.6.1.

Business rules:

- None identified

**Markup example:**

```
<lcChallenge>
<description>...</description>
</lcChallenge>
```

### 2.6.1 Description

**Description:** The element <description> contains a description for the element which it is contained in. It is used in accordance with the rules in Chap 3.9.5.2.

**Markup element:** <description> (C)

## 2.7 Instruction

**Description:** This element describes the specifics of a learning activity.

**Markup element:** <lcInstruction> (O)

**Attributes:**

- `id` (O), the identifier of the <`listItem`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <`description`> (C). Refer to Para 2.6.1.

Business rules:

- None identified

**Markup example:**

```
<lcInstruction>
<description>...</description>
</lcInstruction>
```

# 3 Business rules decisions

Business rules decisions include, but are not limited to, the following:

Refer to Chap 2.5 for an overview of business rule categories and layers that ought to be considered for S1000D technical learning development projects. Business rule decisions will vary from project to project. Below are suggested considerations for any technical learning development project:

**Reuse or repurposing of technical data.** The project or the organization must formulate how much technical data will be reused or repurposed in the course material. Refer to Para 2.

**Development of multimedia or graphics.** The project or the organization must formulate what multimedia and graphics must be developed for both electronic technical manuals and training courses. Refer to Para 2.

Refer to Chap 3.9.7 for a content preplanning discussion.

# 4 Examples

Below is a complete markup example for <`learningContent`>. It describes a short lesson on using an email program.

```
<learning>
<learningContent id="understanding_the_basics">
<title>Understanding Email Basics</title>
<shortDescr></shortDescr>
<lcIntro>
<description><para>Introduce the email learning
content.</para></description>
</lcIntro>
<lcDuration>
<title>Expected course duration</title>
<lcTime>
<description>
<para>It should take you no more than 30 minutes to complete
```

```
this module.</para>
</description>
</lcTime>
</lcDuration>
<lcObjectives>
<lcObjectivesStem>
<description><para>When you complete this lesson, you’ll know
how to perform the following mail basics:</para></description>
</lcObjectivesStem>
<lcObjectiveGroup>
<lcObjective>
<description><para>Viewing the inbox</para></description>
</lcObjective>
 <lcObjective>
<description><para>Opening a message</para></description>
</lcObjective>
 <lcObjective>
<description><para>Moving messages to a
folder</para></description>
</lcObjective>
</lcObjectiveGroup>
</lcObjectives>
<lcChallenge>
<description><para>Describe the learning
challenge.</para></description>
</lcChallenge>
<lcInstruction>
<description><para>Describes the instruction to meet the
challenge.</para></description>
</lcInstruction>
</learningContent>
</learning>
```

## 1 General

The learning summary information model completes the bulk of the learning content. The learning summary structure reviews learning objectives, learning activities and language that

forms the learning materials. It can also discuss lesson assessments and future learning requirements.

## 2 Learning summary content

**Description:** A learning summary recaps and provides context for the achievement or accomplishment of learning objectives, provides guidance to reinforce learning and long-term memory, and can pose questions to enhance encoding and verification of the learning content.

**Markup element:** <learningSummary> (O)

**Attributes:**

- id (O), the identifier of the <learningSummary> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <title> (C). Refer to Chap 3.9.5.2.1.5.
- <shortDescr> (O). Refer to Chap 3.9.5.2.13.1.
- <lcSummary> (O). Refer to Para 2.3.
- <lcObjectives> (O). Refer to Chap 3.9.5.2.13.2.
- <lcReview> (O). Refer to Para 2.5.
- <lcNextSteps> (O). Refer to Para 2.6.
- <lcResources> (O). Refer to Chap 3.9.5.2.13.2.
- <lcSection> (O). Refer to Chap 3.9.5.2.13.2.

**Business rules decisions:**

Business rules decisions include, but are not limited to, the following:

- reusing and repurposing technical data

**Markup example:**

```
<learningSummary>
<title>...</title>
<shortDescr>...</shortDescr>
<lcSummary>...</lcSummary>
<lcObjectives>...</lcObjectives>
<lcReview>...</lcReview>
<lcNextSteps>...</lcNextSteps>
<lcResources>...</lcResources>
<lcSection>...</lcSection>
</learningSummary>
```

### 2.1 Title

**Description:** The element <title> provides a title for the element which it is contained in. It is used in accordance with the rules in Chap 3.9.5.2.1.5.

**Markup element:** <title> (C)

## 2.2 Short description

**Description:** The element <shortDescr> provides a short description of the learning summary portion of the course or lesson. Refer to Chap 3.9.5.2.13.2 for details.

**Markup element:** <shortDescr> (O)

## 2.3 Summary

**Description:** The element <lcSummary> provides a textual summary that describes the main learning goals and lessons learned.

**Markup element:** <lcSummary> (O)

**Attributes:**

- id (O), the identifier of the <lcSummary> element. Refer to Chap 3.9.5.2.1.2.
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- authorityName (O) and authorityDocument (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- securityClassification (O), commercialClassification (O), and caveat (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <description> (C). Refer to Para 2.3.1.

**Business rules decisions:**

- None identified

**Markup example:**

```
<lcSummary>
<description>...</description>
</lcSummary>
```

### 2.3.1 Description

**Description:** The element <description> contains a description for the element which it is contained in. It is used in accordance with the rules in Chap 3.9.5.2.

**Markup element:** <description> (C)

## 2.4 Objectives

**Description:** The element <lcObjectives> lists or describes the learning goals. Refer to Chap 3.9.5.2.13.2 for details.

**Markup element:** <lcObjectives> (O)

## 2.5 Review

**Description:** The element <lcReview> provides a review of the main points.

**Markup element:** <lcReview> (O)

**Attributes:**

- id (O), the identifier of the <lcReview> element. Refer to Chap 3.9.5.2.1.2.

- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <`description`> (C). Refer to Para 2.3.1.

**Business rules decisions:**

- None identified

**Markup example:**

```
<lcReview>
<description>...</description>
</lcReview>
```

## 2.6 Next steps

**Description:** The element <`lcNextSteps`> describes the next steps to reinforce the knowledge learned.

**Markup element:** <`lcNextSteps`> (O)

**Attributes:**

- `id` (O), the identifier of the <`lcNextSteps`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.
- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**

- <`description`> (C). Refer to Para 2.3.1.

**Business rules decisions:**

- None identified

**Markup example:**

```
<lcNextSteps>
<description>...</description>
</lcNextSteps>
```

## 2.7 Resources

**Description:** The element <`lcResources`> provides a list of related resources and information about them, such as related articles or samples on the web. Refer to Chap 3.9.5.2.13.2 for details.

**Markup element:** <`lcResources`> (O)

## 2.8 Section

Refer to Chap 3.9.5.2.13.2 for details.

**Description:** The element <lcSection> provides a generic element to contain other learning content. Refer to Chap 3.9.5.2.13.2 for details.

**Markup element:** <lcSection> (O)

# 3 Business rules decisions

Refer to Chap 2.5 for an overview of business rule categories and layers that ought to be considered for S1000D technical learning development projects. Business rule decisions will vary from project to project. Below are suggested considerations for any technical learning development project.

**Reusing and repurposing technical data.** The project and the organization must formulate how much technical learning data will be reused from module to module. For example, objectives are stated in the learning overview and in the learning summary. Learning objectives must be accurately stated in all related data modules. Refer to Para 2.

Refer to Chap 3.9.7 for content preplanning information.

# 4 Examples

Below is a complete markup example for <learningContent>. It describes a short lesson on using an email program.

```
<learning>
<learningSummary id="understanding_the_basics">
<title>Understanding Email Basics</title>
<shortDescr>...</shortDescr>
<lcSummary>
<description><para>Summarize the email learning
content.</para></description>
</lcSummary>
 <lcObjectives>
<lcObjectivesStem>
<description><para>Now that you have completed this lesson, you
can now perform the following mail basics:</para></description>
</lcObjectivesStem>
<lcObjectiveGroup>
<lcObjective>
<description><para>Viewing the inbox</para></description>
</lcObjective>
 <lcObjective>
<description><para>Opening a message</para></description>
</lcObjective>
 <lcObjective>
<description><para>Moving messages to a
folder</para></description>
</lcObjective>
</lcObjectiveGroup>
</lcObjectives>
<lcReview>
<description><para>Review all main points that support the
learning objectives.</para></description>
</lcReview>
<lcNextSteps>
<description><para>The next steps to advance email proficiency
```

```
are creating distribution lists, creating new accounts and
adding new email servers.</para></description>
</lcNextSteps>
<lcResources>
<description>
<para>There many resources on the internet to advance your email
skills.</para>
</description>
</lcResources>

# 1 General

The learning assessment information model contains a series of questions meant to test the student's learning assessment is modeled as a series of questions, each regarded as an independent interaction.

# 2 Learning assessment

**Description:** A Learning Assessment presents questions or interactions that measure progress, encourage recollection, and stimulate reinforcement of the learning content, and can be presented before the content as a pre-assessment or as a post-assessment test. The format of each interactive assessment question can be structured as one of the following question types: true-false, single select, multiple select, sequencing, matching or hotspot. Therefore, one "learning assessment" can contain a series of individual "interactions", each of which contains a "question type". The interactions use a subset of the Question-Test Interoperability (IMS QTI) specification.

**Note**

The true-false, single select and multiple select structures use the same content model, <`lcQuestionOptionGroup`>. There is one <`lcQuestionOptionGroup`> for each assessment question.

**Markup element:** <`learningAssessment`> (O)

**Attributes:**

- `id` (O), the identifier of the <`learningAssessment`> element. Refer to Chap 3.9.5.2.1.2.
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), which are used to indicate change in accordance with Chap 3.9.5.2.1.1.

- `authorityName` (O) and `authorityDocument` (O), which are used to indicate controlled content in accordance with Chap 3.9.5.2.1.11.
- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O), which are used for security and restrictive marking in accordance with Chap 3.9.5.2.1.

**Child elements:**
